He has ascertained that the cost of machinery to press 60,000 pounds of seed per day is $5,150. After the oil is expressed, the residuum may be made into "a very superior toilet and laundry soap." He adds that the oil is used for many purposes—among others, that of *adulterating* other oils—and is a superior salad oil. (Its use for *adulteration*, if the term is employed in its common sense, is, of course, to be condemned.) He affirms that we might get from the seed, now almost wasted, enough food for every milk cow in the United States, salad oil enough for the world—and forty millions over, and soap enough for the United States. His expression "*almost wasted*" may refer to the custom, extensively prevailing, of using the seed as a fertilizer. Great quantities are used in composting.

University of North Carolina.

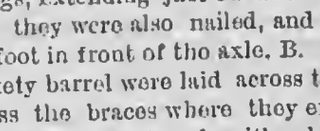
Farm Topics.

FARM HINTS.

I LIKE the RURAL'S suggestion, of a few weeks since, that farmers should give a description of any cheap devices they may have found to be of value. I believe we might "exchange" valuable hints if we were awakened to the subject.

A BRIDLE MENDED.

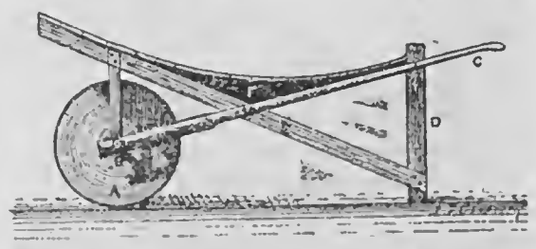
A year or two since, while busily at work on the farm, the bit in "Charley's" mouth parted in the middle, and could not be tied or wired together to do temporary service. My boy entirely removed the pieces, took two rings, each about two inches in diameter, an old strap about a foot long, doubled it through the rings, leaving a ring at either end; a few stitches in the



middle, and a bit was made that answers every purpose, is not a terror on a frosty morning, and is in use yet.

A HANDY "WHAT IS IT."

It is not convenient to remove the manure from my stable with a fork and shovel alone, the deposit being too far away. The barn barrow was burned, and a substitute must be devised. The hind wheel, A, of a boy's cast-off cart was at hand. The wheels had been sawed out of a cottonwood board. An axle, B, was made about 2½ feet long. Two white-ash poles, C, each about five feet long, were denuded of their bark and framed into the axle, and we had



the handles to our "What is it." For legs, D, strips of cottonwood, about three inches wide and two feet long, were nailed securely to the handles, C, three inches projecting above. For braces, E, longer strips were nailed to the foot of the legs, extending just outside the handles, to which they were also nailed, and projecting about a foot in front of the axle, B. The staves of a rickety barrel were laid across the handles and across the braces where they extended in front, and were fastened with shingle nails and——the baby begged for just one ride. The bicycle (?) is loaded in the stable, run out upon the manure heap and tipped over endwise instead of sidewise.

More perhaps, by and by, if we get *quid pro quo* in exchange. R. H. CRANE.

A GOOD FARMER.

PROF. W. J. BEAL.

I GIVE a few notes taken at the residence of J. D. ADAMS in Climax, Kalamazoo County Michigan. He has a farm of some 700 acres nearly all of which was purchased at different times at a very low price many years ago. The soil was strong and first-rate, bearing some Burr Oak and Hickory. It was only very gently rolling and needed no ditching. This farm has taken some premiums as the best in the State. Mr. ADAMS began as a poor man. He labored for the money to buy his land.

His house and barns are neat and well built, though there is nothing extravagant about them. The floors of the barns are all laid on grout which does not permit vermin to find a hiding place. The cost is not very great, and the owner is always gratified with the result. No cold currents blow under the floor. No animals injure their limbs by breaking through the floor. There is a wind-mill on top of the barn, which pumps water into the tank in the loft of the barn. From the tank run pipes to tanks for the stock. Everthing is well built—from first to last—to prevent accident and frequent repairs. The proprietor is ingenious, and makes many little repairs though he does not do all the work on his buildings.

He has always practiced mixed husbandry. Everything is convenient. He keeps, if I remember right, seventeen horses, 300 sheep, about fifty cattle and a large number of hogs and fowls, yet two men take good care of all these, and find much time to get up wood and do other work. The stalks are drawn from the field as they are needed to feed. This winter, in good weather, he has fed cattle every day in the orchard. The stalks will serve as a good mulch next year. He fattens some steers and sheep. He is particular to save an abundance of seed corn early and stores it in a perforated iron chest in the chamber of his house. He has not had any freaks of running wild from one part of farming to another, but has kept on an even course. Mr. ADAMS has learned from experience and from others with whom he has come in contact. We judge he is not a book-farmer in any sense of the word. With more knowledge of what others have done as recorded in books and papers, he would, no doubt, have made still more money as a farmer.

We attribute his success to buying at a low price excellent land which needed no ditching; to his ingenuity, and thorough way of doing all kinds of work; to his steadily adhering to some system of farming; to his economy in the use of money and time, as shown in his saving of

labor in every way possible; to his habit of keeping good stock and avoiding fancy prices when purchasing.

CONTENT ON THE FARM.

My June pullets, thirty-five in number, commenced laying about the 1st of December and averaged about two dozen eggs each day until within three weeks ago when eggs went down. Then my poultry, thinking it did not pay for the wear and tear, dropped very suddenly to three or four eggs a day. They have now recommenced laying abundantly and I shall consequently expect to see the egg market improve. I feed buckwheat and oats and corn and clam-shells, all they want, and plenty of clean water.

I keep ten cows: they have made two hundred pounds of butter since the first of December, are looking well and are coming in in March. I feed twice a day, once in the yard and once in the stable. I like to have my cows run out in the day-time, unless stormy or very windy. I think cattle are stronger if wintered in this way. I feed corn-stalks and two quarts of Indian meal and buckwheat-bran mixed, mornings; and at night, all the hay they will eat and the same feed of grain. I have farmed thirteen years and never had a sick cow in the spring. My hogs get all surplus milk and I think do much better than if fed on clear grain.

I have seven hundred fruit trees and to protect them from the mice in the winter, my little boy goes ahead with a pick and loosens the ground, and then I follow with a hoe and clear from around the tree everything wherein mice can harber, and pile around each tree a little mound of clear dirt about three inches high. Moreover, I take a wire and sharp knife along with me and clean out every grub. This work I do about the middle of September, and I am never troubled with either mice or grubs. My trees have been set from two to ten years, and in that time I have lost only one tree through the ravages of mice.

This, of course, requires some labor; but as some worthy has said, you can't get something from nothing. A little labor laid out at the right time, saves a good deal of money and trouble. I hate to lie awake at night and think that mice and grubs are undoing what I have tried to accomplish.

Now, just one word for the birds. I think they are my greatest friends. Nothing makes my children more happy than the return of these feathered wanderers. They are harbingers of the summer days, and they follow me as I turn the furrow, and clean my land as well as the trees of all the pests they can get at. I have never been in the law business, but if I should see anybody on my premises shooting birds, I think I should give him a dose of Blackstone. I am happy in farming and think all farmers would be so, if they worked more and grumbled less.

W. H. INGALLS.

Green County, N. Y.

BUY GOOD LAND.

In buying farms there are usually many things to be considered, the size of the purse, nearness to market, good water, healthful climate etc. In visiting many portions of several of the Northern States, we have usually found the people most prosperous where the land was the best. There we find the best houses and the best barns among the farmers. A lean soil supports farmers who are unable to build fine houses and barns. To till land costs a good deal. To grade it and take out stumps also often require much labor. I have concluded that enough attention has not been paid to the subject while hunting for a home. Fine new farms of the best soil are held at high prices, but I think they are cheaper than poor land at any price, if they are intended for most kinds of farming, and for similar reasons land of medium quality is also dearer than good land at any price.

W. J. B.

Horticultural.

A WORD TO INQUIRING FRIENDS.

In sending specimens of plants for name, some of our friends merely forward a blossom, a leaf, a seed or even a piece of stalk. It would be well in such cases, to bear in mind the multitudinous genera, species and varieties of vegetation, many of which in one or more of these particulars so closely resemble each other that several points of comparison must be instituted between them in order to distinguish one from the other. Hence, a leaf and a blossom should always be remitted to us to insure a satisfactory answer to a query in this connection. In this matter, as in all others connected with agriculture, horticulture, and kindred subjects, we shall be happy at all times to furnish the best information to inquiring friends. Entomology also is yearly becoming a subject of greater interest and importance to the farmer, and the necessity is constantly growing more urgent that he should make this a subject of study and attention. All inquiries connected with this department of knowledge shall secure prompt attention through our columns, and we cordially invite our friends to send us specimens of all insects about which they may desire to obtain information.

BLEEDING HEART.

Will you tell me what plant is meant by Bleeding Heart? Would it be hardy here? Is it a shrub or a root? Would you advise me to purchase a plant?

E. C. A.

Meadville, Pa.

We furnish, for the benefit of our inquirer, a very accurate sketch of what is generally known as Bleeding Heart, sketched from life by Mr. HOCHSTEIN, years ago. Dicentra spectabilis, (sometimes Dielytra s.) is the botanical name, and a more charming spring plant we hardly know. It is quite hardy, will take care of itself if given half a chance, and cannot fail to please any lover of flowers.

The plant is from the north of China, and is a herbaceous perennial. The flowers are much like those of the biennial vine, Adlumia cirrhosa (Climbing Fumitory, Alleghany Vine,) with which our friend may be familiar. But they are far prettier, the white and bright rosy-pink flowers adorning the graceful sprays of foliage like so many heart-shape gems. The foliage appears in April and the flowers in May. The roots may be allowed to remain in the same place for several years, when they will form large masses that few of the treasures of the floral world can equal.

BLEEDING HEART—DICENTRA SPECTABILIS.

To those who have seen this plant from childhood, in almost every garden of the neighborhood, the above may seem extravagant praise, while, if they set eyes upon it for the first time they would find it difficult to frame their admiration of it in fitting words.

To the botanist, the flowers are especially interesting, and a study of the manner in which the stigmas are pollenated will repay the young student.

SLITTING THE BARK OF HIDE-BOUND TREES.

WILLIAM FALCONER.

This is a tender question and one to which there may be two sides; and with due deference to your scientific correspondents who, with the RURAL, have adopted the negative, I must, in justice to my own practice and observation, assume the affirmative. Of the existence of hide-bound trees I am perfectly satisfied, and the writings and teachings of our most noted modern physiological botanists prove scientifically what I have noted practically. That the slitting of the bark does relieve trees so affected I have proved to myself beyond a doubt; however, I do not mean to dictate to others, but merely relate my own experience.

Trees growing under natural conditions, as by the way-sides or in the fields and woods and not subject to artificial pruning and training, are less liable to this ailment than are cultivated trees—the members of our gardens and orchards. Grafted, budded, and clean-stemmed trees are the most subject, and trees that have been firmly supported by the help of stakes from their early youth, are more liable to become hide-bound than those that have been allowed to support themselves.

As your other correspondents have called attention to this subject as regards out-door trees, permit me to notice it respecting trees cultivated in glass-houses, and which from their artificial conditions of growth are very liable to become hide-bound.

In the United States we know little of fruit-growing under glass, because our out-door conditions are so favorable; but in Europe the cultivation of Peach, Nectarine, Apricot, Plum, Cherry, and the finer kinds of pear trees in orchard-houses, is one of the most particular branches of horticulture. No matter what-like the season may be, out-of-door gardeners are expected to annually reap from the orchard-houses the very finest fruits, and heavy crops of them. With this end in view, they make it a point to keep their trees in the best condition, both as regards roots and crops; in fact, nothing is left undone that money and skill can do. Let us take the Peach for instance. The Peach trees are budded on Plum stocks, and mostly grown in inside borders and in pots, those in borders oftentimes living to the age of 30 or 50 years and over, as may be seen at the Earl of Stratford's gardens at Barnet. During a few years of their youthful career the trees, in growth and in fruitfulness, are usually all that can be desired; but after a time the diameter of the peach stem may considerably exceed that of the plum stem with a knob or hood at the union. Gardeners who know their business, never permit this difference to attain an injurious degree, but timely correct the matter by slitting the bark of the plum stem, and thus securing the desired end—a greater and more proportionate passage-way for the conduction of food from the roots to the tops.

Referring to "the great assistance, to the increase in diameter of trees, afforded by the diminution of the pressure of the bark on the cambium," we find in "Sachs' Morphological and Physiological Botany,"—"The bark of young trees is split from above downwards in summer; cushions of wood are formed at the edges of the incisions, which soon close up the wounds. The use of this process is that from the more rapid increase of the wood in thickness, the conduction of water to the leaves becomes more copious, and the loss by transpiration is more easily replaced. The development of the buds and hence the formation of the organs of assimilation will be promoted by the increase of turgidity in the young branches." That the narrowness of the plum stem would beneficially affect the peach trees grown under glass, by curtailing their wood-luxuriance, would be a libel on gardeners, for once their trees begin to fruit, they practice other and better means of regulating growth.

The effect of the evil of the hide-bound tree is first observable in debility of the leaves and young wood, a tendency to drop more fruit than healthy trees usually do, and inability to satisfactorily mature in quality and quantity the fruits that remain. Two notable examples—one at Clapham, and the other at Twickenham—of the evil of "hide-bound" in peach-trees came under my notice some years ago. In both cases the gardeners—green-house men who knew nothing of fruit-culture—were averse to slitting the bark because it was contrary to their ideas of physiology. "And if Camelias and if Azaleas—both 'worked' plants were shrouded in blooms without slitting, why shouldn't the peach-trees ripen good fruit with equal immunity?" But they didn't, and instead annually be-

came worse. Why? The ventilation, position, and borders could not be improved, and the evil was elsewhere. One man would not be advised and though he always got peaches, they were poor samples; but the other—Mr. Wm. Cummings—slit all of his trees but two, and in a couple of years he had as good peaches as anybody. The two left, were kept at my request by way of experiment. One was in the early house—fruit in May—and the other in a later compartment—fruit in June and early July. The early tree—Royal George—at the end of two years showed much greater decrepitude than the late one—Walburton Admirable—which I presume, was owing to the latter's more natural condition of growth—exemption from hard forcing—but both yearly produced and ripened fruits, though these were fewer and inferior to those yielded by the "slit" trees. The result so overcame Mr. Cummings' ideas of physiology that in future he resolved to assist as well as follow nature.

That the evil under these artificial conditions, does not appertain to any bad state of the root-bed is perfectly evident; it is found in the inability of the compressed hide to grant the ready passage of nourishment sufficient for the healthful demand of branches, leaves, and fruit, or, in other words, "the trunk being left to itself can not appropriate its proper share of the nutriment supplied." This "slitting the bark," is a more delicate operation than some may think: in fact, it is a job experienced gardeners either do themselves or have done by their foreman, for they would no sooner trust it to their journeymen, apprentices, or laborers, than an army surgeon would the amputation of an officer's leg to a private soldier.

When this operation should be executed, is most reliably told in answer to a correspondent by the Eds. of the Gardeners' Chronicle, p. 1121. 1867:—"Early in the season, but not when the tree would bleed from the cuts; therefore not when the sap is flowing, but when the leaves have expanded." As regards the slitting itself, may I ask what harm does it do to the tree operated on, providing a sharp thin-bladed knife be used, the cuts made clean, through the bark—no more—from top of main stem downwards, and one or two incisions (two to three cuts are usually made at first application,) and the time in New England be during the first three weeks in July? I never knew evil to accrue from thus judiciously slitting the bark, but on the contrary, time and again, I have found it to most forcibly improve debilitated and mossy apple and pear trees that I was satisfied were hide-bound.

Gumming and other diseases are generated by unjust mutilation of the bark of stone-fruit trees, and with this in view, and incited by a discussion we had on this subject when I lived in the Southern States, I slit the bark of peach, nectarine, apple, pear, persimmon, box-elder, and several other trees, that were not hide-bound, and not in a single instance was gumming or any harm apparent, and by the succeeding winter the wounds had filled up and healed over. My friend, Mr. Silman of Leon Co., Texas, had a peach orchard of fine young trees, and a few he trained as high standards, that is, with clean stems, some four feet high, as he wished to plow under them after they became biggish trees, but they grew unwieldy and several got broken. I called there in May '75, and we discussed the orchard freely. I advised him by no means cut out his standards, but instead, either firmly stake them permanently, or stake them temporarily and slit them to see what effect that would have on them. "Well," he remarked "they're of little use as they are anyway, and if you do it for me, I'd as lief slit them as not." I slit every alternate tree, and when I saw them again—the January following—the average trunk of the slit tree was some three-fourths of an inch greater in circumference than that of the uncut, and all were well healed and sound. The land was cleared Post Oak, and the soil a rich gray sandy on a clay subsoil. The point to be gained in this case was not a relief because of hide-bound, as the trees were very thrifty and not perceptibly, if at all, hide-bound, but to get a trunk stout enough to support its head unassisted.

At Corsicana I met a farmer from Waco, who has a thrifty orchard of apple trees, but, he said, the stems were not growing as fast as the tops were and he had to stake them. The trees were of tall-standard fashion, as we have in the Northern States and quite unfit for the South. I told him to slit the stems and if any switches grew on the stems not to cut them off as he used to, but pinch their points when they got six or eight inches long, and then cut them off in winter. He said he would try it, and in a letter I had last fall from a friend at Mexia, he thanked me for the suggestion, and stated that his trees had improved mightily.

This idea was first impressed on myself by my esteemed friend Pitman, who is foreman in that old-established and famous nursery—Osborne's, at Fulham, London, and who during 55 years has been connected with the establishment. He endeavors to prevent rather than induce and then cure this hide-binding. He does this by permitting the existence of a few sprayey or spur-like shoots along the stems of the young fruit and ornamental trees. Not only does this prevent the stems from becoming hide-bound, but it also so strengthens them that stakes are seldom necessary as supports. Of course, I don't mean that the trunks are feathered like those of annually clipped basket-willow trees; no, only a few shoots are left, and these are foreshortened in the summer time and removed in the winter.

Whether or no trees become hide-bound, and the effect produced on them by cutting the bark, is scientifically and most minutely detailed in that excellent work—Sachs' (professor of botany in the University of Wurzburg) text-book of Morphological and Physiological Botany, and under the heading of "Mechanical Laws of Growth—modification of growth caused by pressure and traction."

The practice of slitting the bark in order to relieve hide-bound trees has been practiced for centuries back, as will be observed from the following lines which I quote, by way of curiosity, from Lord Bacon's "Sylva Sylvarum," which was written in the earlier years of the Seventeenth century;—"It hath beene observed, that *Hacking* of *Trees* in their *Barke*, both downeright, and acrosse, so as you make them rather in slices, than in continued Hackes, doth great good to *Trees*; And especially deliver eth them from being *Hide-bound*, and killeth their Mosse." The presence of moss upon trees he attributes to loss of vigor, thus:—"*Old Trees*, are more *Mossie*, (farre) than *Young*; For that the Sap is not so francke as to rise all to the Boughes, but tireth by the way; and putteth out *Moss*."

Botanic Gardens, Cambridge, Mass.

CATALOGUES, &c., RECEIVED.

D. C. McGraw, Riverside Gardens, Binghamton, N. Y. Abridged catalogue of seeds, greenhouse and bedding plants, shrubs, evergreens, &c., for the spring of 1878.

T. S. Hubbard of Fredonia, N. Y., who, as is well known, has made a specialty of grape-vine culture and propagation for many years, will send a price-list free, and a descriptive list of trees and small fruits also, upon receiving postage stamp.

The Stockbridge Manures, originated by Prof. Levi Stockbridge, and sold only by W. H. Bowker & Co., Boston and New York. A pamphlet giving all needed information and prices.

Ellis Brothers, Keene, N. Y. Descriptive catalogue of choice green-house and bedding plants, seeds, small fruit and vegetable plants for 1878.

Our acknowledgments are due to Messrs. S. R. Wells & Co. for a very useful as well as ornamental Phrenological Bust, which they present to each subscriber to the Phrenological Journal for 1878.

Circular. Analyses and commercial values of commercial fertilizers admitted to sale in Georgia. Under the supervision of the Commissioner of Agriculture, Atlanta, Ga.

Waukegan Nursery, Robert Douglas & Sons, Waukegan, Lake Co., Ills. Wholesale catalogue of evergreen and ornamental tree seedlings, etc. Messrs. D. & Sons have found that, after twenty years' experience in growing evergreens from seed, packing and shipping millions annually, they can so pack and ship them that they will arrive as safely and transplant as successfully as apple or other deciduous trees.

Thomas Jackson, Portland, Me. — Twenty-seventh annual wholesale Catalogue of Nursery Stock for spring of 1878.

Plant Seed Co.'s Illustrated and Descriptive Catalogue for 1878, St. Louis, Mo. Vegetable, Field, Tree, Grass and Flower seeds, Seed Potatoes, Summer-flowering Bulbs, etc., 64 pages, free to applicants.

Cole & Brothers, Pella, Marion Co., Iowa. Illustrated Guide to the Flower and Vegetable Garden. Vegetable seeds of all kinds—Chufas, Artichokes, Field and Flower seeds. This catalogue offers special premiums to all purchasing seeds.

D. M. Ferry & Co., Detroit, Mich. A catalogue for 1878, comprising 144 pages and hundreds of excellent engravings and two chromos. Free to all.

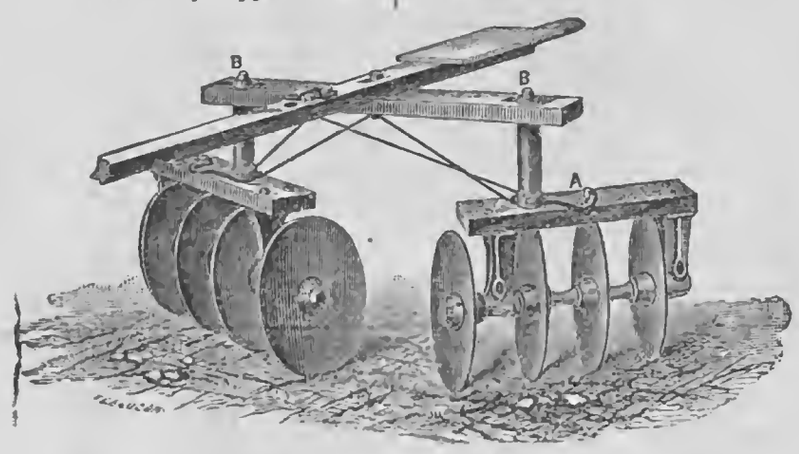
Peter Henderson & Co., 35 Courtlandt St., N. Y. Catalogue of "Everything for the Garden." We need scarcely refer to this comprehensive catalogue as being one of the most attractive and instructive of any published. It offers many novelties and two colored plates, one of Pansies, the other of the Hydrangea, "Thomas Hogg" and the white Tea Rose "Cornelia Cook."

Our thanks are due to Mr. Daniel H. Wheeler, Secretary of the Nebraska State Board of Agriculture, (Plattsmouth)) for an address by Prof. Rodney Welch upon "How the West has Moved On."

R. S. Johnson, Stockley, Del. Wholesale price-list of Nursery stock at the Sussex Nurseries. Also abridged wholesale price-list.

George S. Josselyn, Fredonia, N. Y.—A little work of thirty-two pages with plans and elevations descriptive of the most approved methods of caring for high class poultry. Events and items of interest and importance for reference. It will be sent free to all applicants. Mr. Josselyn is, we presume, one of the largest breeders of pure-bred poultry in the world. He may be the largest for aught we know.

The Dingee & Conard Co. — West Grove, Chester Co., Penn. The New Guide to Rose Culture. We have much pleasure in commending this catalogue to lovers of the Rose, for it contains all the information in a plain practical form, that anybody needs, and is to be obtained for the asking. Its perusal will reveal the secret of their great success as rose-growers, a success scarcely equaled by any other establishment of the kind in this country.



BRAMER'S CORN HARROW.

Industrial Implements.

BRAMER'S CORN HARROW.

If the farmer of one hundred years ago were permitted to return to the scenes of his busy and useful life, he would be gratified to find his prediction more than fulfilled. He would see the wilderness, where his were the first sturdy strokes that felled the trees, now peopled by an active population, the farmer on his rich and productive farm, the mechanic in his workshop, the merchant at thriving business centers, exchanging the products of labor; each contributing to the success of all. But this would not be all. He would note the rapid strides that had been made in the methods and means that wrought such results—making the work lighter, more expeditious, and productive of better results. He would see that improvements in implements to aid the husbandman, had enabled him to till his fields, cut and secure his crops, and do all the work that, in his day, taxed physical endurance to the utmost, with ease and celerity. The old saying that "He who makes two blades of grass grow where but one grew before, is a public benefactor," is no more true than that he who, by his ingenuity, makes it possible to do in one hour, without additional expense, what before had required two hours, is entitled to the same praise; for time is money, and in these days no laggard need hope for success.

The Warrior Mower Co. of Little Falls, N. Y., whose name has become familiar to farmers as manufacturer of the "Warrior," has, without doubt, enabled many a farmer to make two blades of grass grow where but one grew before, by the introduction of the Randall Harrow, making it possible to do twice the work in a given time, and, while thus reducing the labor, largely increasing the yield of the lands. This Company, ever alive to the wants of the farming community, has, after thorough tests, added, this season, to the specialties of its manufacture, a Corn Harrow, for working rowed crops.

This implement represented by the cut, has the same soil-working devices as the Randall Harrow; a series of plate wheels set so as to run at an angle to the line of draft, each wheel cutting, lifting, turning over, and thoroughly pulverizing the soil in its path. In the Corn Harrow the two gangs of four of these wheels each, are used; one gang working each side the row. The advantages claimed for this Corn Harrow are, that instead of lifting up the soil and allowing it to drop back in nearly its original position with weeds and grasses, in many cases, left in prime condition for growth, it cuts deep, and turning the soil, buries the weeds and grass beyond the hope of resurrection. Instead of clogging with every obstacle with which it comes in contact, it rolls over and cuts through without trouble or delay. It is easily changed to throw the soil towards or from the growing crop as may be desired. It is also adjustable in width to adapt it to the work to be done.

"THE FIRE ON THE HEARTH."

In this age of thrifty devices no object of domestic economy has taxed the ingenuity and skill of inventors more heavily than the discovery of that form of stove which, while simple and inexpensive, is at the same time most economical of fuel and most efficient in diffusing throughout the area to be heated a uniform and wholesome temperature. While the ordinary open fire-place is pleasant in its cheerful glow and healthful by the ventilation it produces, yet it is a sad waster of fuel, both on account of the imperfect combustion effected by it, and because warming the room almost entirely by direct radiation, the air which causes combustion, rushing in a hot current up through the chimney, is wasted in the open air instead of being utilized either for culinary purposes in the kitchen or for increasing the temperature in sitting rooms. It has been calculated that on an average six-sevenths the caloric contained in fuel used in ordinary open fire-grates, is lost in this way; while some of the lauded hearths of our fore-fathers swallowed up in their capacious maws fully seven-eighths. The ordinary closed stoves, while lacking the genial glow, and easy ventilation of the open grate are, it is true, far more economical of fuel, yet they are, many of them, very unnecessarily wasteful, a fact that can be readily detected by feeling the temperature of the pipe through which the smoke and other products of combustion escape into the atmosphere. Moreover, when made of cast-iron and highly-heated carbonic oxide and other deleterious gases are generated which, every winter, are stealthy, but prolific causes of not a few annoyances and ailments.

Among the numerous stoves of various patterns and patents, that have come under our notice, there is none which commends itself more strongly than "The Fire on the Hearth" both for its beauty of design, simplicity of construction, cheerfulness of effect economy of fuel and efficiency in diffusing a healthful and uniform temperature. Used with the blower on, it acts in every way like a close stove, but with a large, additional air-warming capacity; with the blower off, it is converted into a "Franklin" stove, cheerful as an open grate, but with a greatly increased air-warming power. So thorough is the combustion of fuel in this stove, and so entirely is the heat utilized in warming the room that the temperature of the products of combustion escaping through the smoke-pipe into the chimney, when the blower is off, is actually less than the temperature of the air delivered in the room from the top of the stove, demonstrating the remarkable utilization of the heat generated from combustion of fuel. This excellent stove, which during the six years of its existence, has found its way all over the world is for sale by The Open Stove Ventilating Co., N. Y.

Miscellaneous.

FARM NOTES.

S. Rufus Mason.

A CHEAP POULTRY HOUSE, AND HOW TO USE IT.

A house for 50 hens should be 16x24 feet inside. Set up 3x4 posts, 8 feet long, so as to inclose that space, and outside of that another row, four feet off. Nail boards, 1x4 inches, around the outside and inside,—one board even with the top of the posts, one six inches from the bottom, and one in the middle. Let the posts be about five feet apart. Nail common plastering lath upright from the top strip down to the bottom strip, and about six inches apart. Lay for the roof a 3x4 from post to post across the room, not the cribwork; support these by central posts, and cover with long, straight willows, laid quite close. The door and windows must now be provided for. I use three hot-bed sashes on one end, and the light is ample. The frame of the house is now finished. Fill in the walls with straw, old hay or any light material, packed down tight; cover the whole with straw

or hay, stacked on, and you have a cheap, warm house.

Now if, in building this, it is made in bents, it can be taken down readily, removed to a new site, the old straw thrown away and replaced with new in a few hours, and you have a new, clean house. Every spring and fall, burn a pound of brimstone in the house, and vermin will be very scarce. Hoe out the droppings once a week, keep the floor *dry*, remove the whole building once in three years, and pip, croup, cholera and all such, will give place to robust health and vigor. Never build a palace for poultry.

SULPHUR FOR SWINE.

The practice in some parts of the West (Iowa, especially,) of throwing bituminous coal to hogs, is a poor mode of administering sulphur. Their liking for it is also a proof that they are not generally in a healthy condition. Too much corn, too few roots, a constant confinement to pasturing over their own excrement, contaminated water, and foul air generated by crowding at night, are certainly conducive to ill health.

Pork, even in its best condition—that is, when produced by stock kept entirely healthy from birth to killing time—is the most unhealthy food for man, and an abomination to a large portion of the world's population. What must it be when made from animals so constantly in ill health as to crave such food as coal?

Until we follow the example of the Jews, Mahometans and other nations who discard swine flesh, we must expect to be only what we now are—transmitters of scrofula to our children, even to the third and fourth generation. I doubt if that filthy disease could be eradicated from pork eaters under ten generations. If this is conceded, why does not public opinion demand a mode of treatment which shall make the least possible objectionable quality of this great staple?

TALKS UPON THE PRAIRIES.

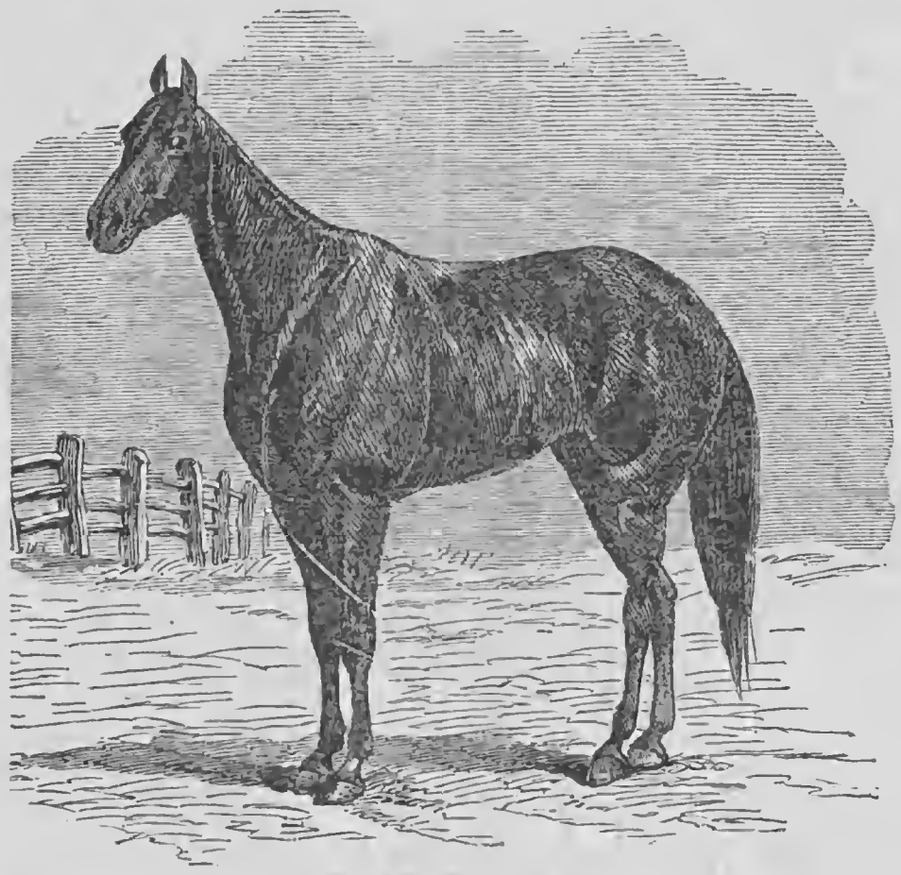
BY FRONTIER.

Writing within a few miles of the geographical center of the Union, and near the middle of that great prairie region that stretches from the head-waters of the Saskatchawan and Red River of the North, to the Rio Grand and Gulf on the south, you may be sure that we feel something of the importance that attaches to this prairie country. Room! there is no word to express it. Men are crowded here by neighbors five miles away. Wheat, and corn, and cotton! The head tires of the millions of bushels of the former, and pounds of the latter. And more wearied still are we in counting up the hundreds of thousands of cattle, to say nothing of the sheep, roaming over the plains from the Gulf to the head-waters of the Platte, drawing just now only a meager support from the rain-soaked and sun-burned grasses, unfortunately covered at the North with more than the usual burden of snow. And more wearied shall we be if we talk of the starved carcasses which a few stormy weeks may scatter over the plains; these are not our chosen themes, but they come within the Rural's range as an agricultural paper.

We are glad, however, to see so ample a space given to topics that may be grouped under the heading "Horticultural," if we use the term in its most liberal sense. Let us say that the Rural of February 2nd 1878, is really a gem among papers. Here we have Floricultural, Arboricultural, Pomological, indeed a full service of Horticultural dishes, thoughtfully and practically presented. Nor shall we ever have reason to complain, as long as you can fill up the "Miscellaneous Department" with such mature and valuable papers as that of Secretary Garfield.

In the culture of corn and wheat, as well as in the raising of stock, our processes are, of course, in some degree modified by our peculiar climate, but when we come to Forestry, Pomology, Flower and Vegetable Gardening, we find ourselves thrown almost utterly adrift from the experience and instruction of the past years in the East. In some sense we are beginners in a new world. For example, some trees that make fine forests on the shores of Lake Michigan, cannot be coaxed into forest proportions here. The varieties of fruits that are now, in February, only deliciously ripe on the banks of the Hudson, our clearer sky and warmer suns gave to us fully matured in the early fall. Some flowers and shrubs that are the delight of the Eastern gardener, may as well be left behind if he comes to the prairie for a home.

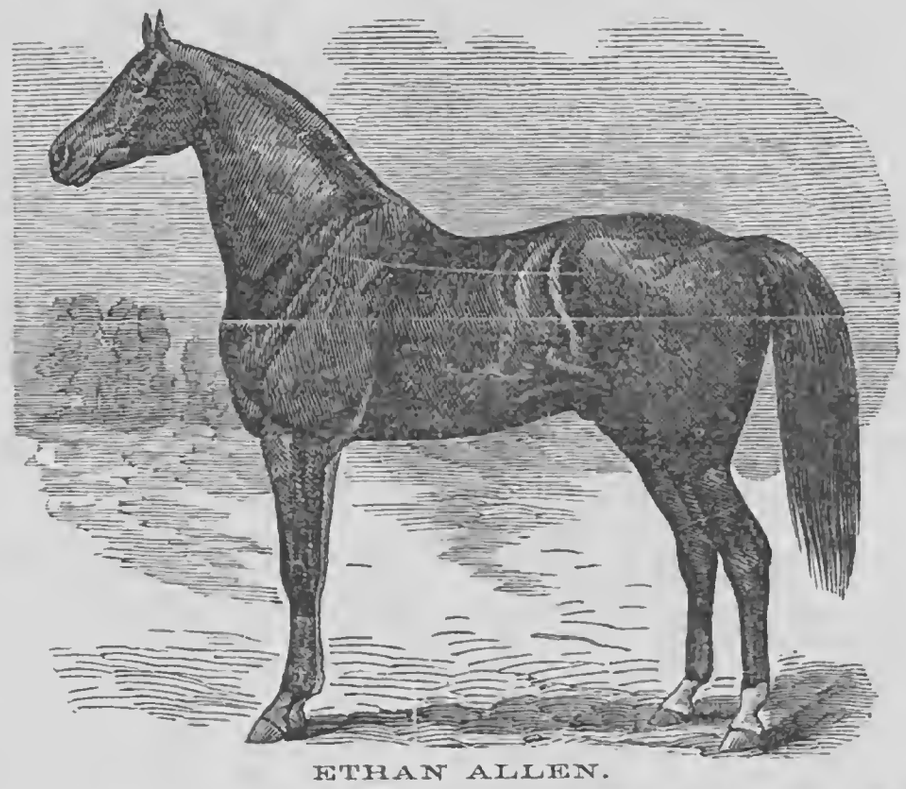
It is hard to realize this, and hence we see thousands of men, every year, wasting means and strength in vainly trying to do what can't be done. One man writes: "I have a peck of Norway Spruce seed, how shall I plant it?" Another says: "Dear friends in the East have sent me a few quarts of beech-nuts, when and where should they be planted?" And still another: "I have brought a fine lot of Sugar Maple seed from my old home in the East, and I want to plant the hill-side to the north of my house to keep off these cold northwest winds. Can you give me a little instruction as to how to plant?" It is hard to say to all the people, "Don't;"—better sometimes, perhaps to let them try. Some must learn in this way. How much better if others could learn just a little in regard to the climatic conditions which they must meet before they come here!



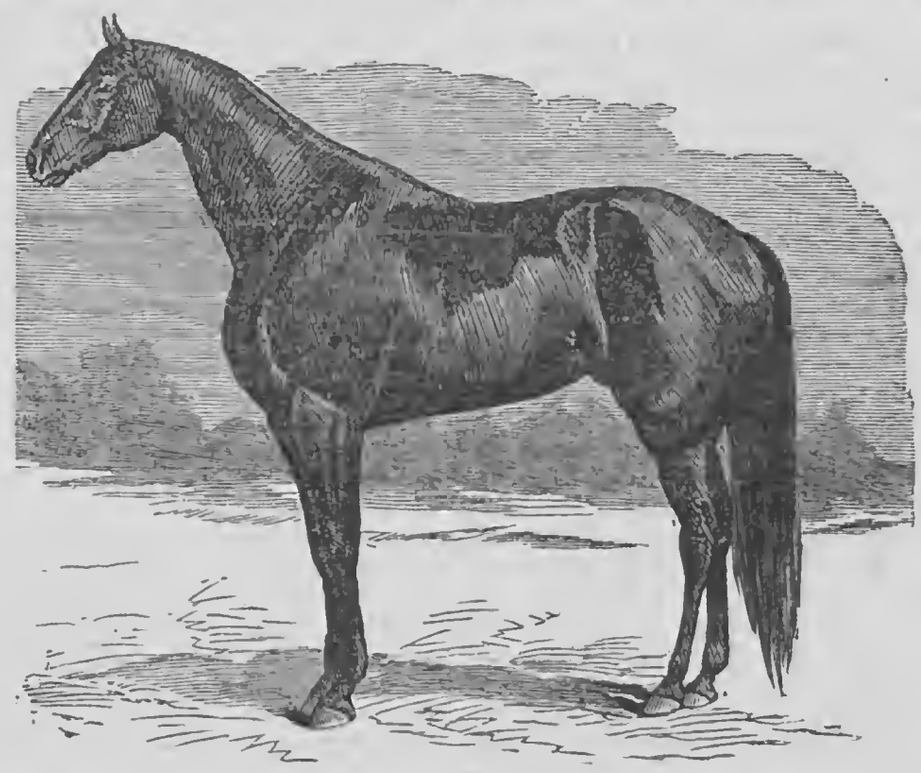
LADY THORN.

THE OSAGE ORANGE.

I am glad to see you call special attention to the Osage Orange. It is not only a beautiful lawn ornament, contrasting finely both in form and color, with many other trees and especially noteworthy when loaded with its curious fruit, but its wood must be counted as among the most valuable. The old French name *Bois d' Arc*, or Bow-wood, suggests its true character, in one respect. But while remarkably elastic, it is quite incorruptible. And this is true not only of the the heart-wood but of the sapling twigs no larger than a finger. A little stick was sharpened and put into the ground three years ago, and I find it is now as free from decay as at first, so that even the sap-wood only wastes away but does not rot. This tree is perfectly at home to the south of Nebraska, and while it will endure our dry uplands, it grows with greater vigor upon our bottom lands. It is *the* hedge plant for the plains, without question; but it ought also to be counted among our best timber trees. It is furnished here for hedge at about $1 25 per 1,000. And hence while it is one of the best, it is really among the cheapest of trees for early forest planting.



ETHAN ALLEN.



CONFIDENCE.

WINTERING NURSERY STOCK.

Within the past ten years we have had two very severely cold winters. Many trees of all kinds standing in nursery rows, were injured more or less or killed outright. Our most enterprising nurserymen began to experiment. Two or more of the largest firms in Michigan now have the following arrangement for keeping trees in winter. They construct large, well drained cellars which have stone walls at the sides, and windows for ventilation. In these cellars they place damp sand; in autumn they take up from the rows all the stock which they expect to sell in the following spring. The trees are healed in deep, and remain ready for orders in spring. No severe winter can cheat the owners out of this stock. The trees are arranged in systematic order so it is possible to get out any variety at any time. There are other advantages in keeping trees in this way. The owner can begin to pack and ship early in all kinds of weather. He can take a few at a time and avoid exposing the trees to dry winds or the sun. In the cellar trees will remain quite late without starting to grow. Orders can therefore be sent out later as well as earlier if the stock is kept in cellars.

W. J. Beal.

The Horseman.

NOTED TROTTERS.

Among civilized mankind there is a legitimate curiosity to learn the appearance and history not only of those of our own species who have distinguished themselves by some special excellence in their various vocations, but also of those among the lower orders of creation, that have displayed pre-eminent merit in their particular careers. Among the latter, none has ever excited this sentiment so strongly or universally as the noblest of all irrational animals—the horse. In every age some of these have won celebrity for some special excellence, and the interest they have excited among men has been second only to that aroused by the pre-eminent members of our own race. It is this consideration that has led us to present to our readers a series of accurate portraits accompanied by brief accounts of some of the most celebrated trotters whose names are familiar to most of our patrons, and about whose appearance and history many of them feel a very legitimate curiosity.

LADY THORN

was one of the most celebrated of trotters of the last equine generation. She was a large powerful bay mare, very high-bred, very game and resolute. She was got by the famous Mambrino Chief and had another cross of the Messenger blood through her dam, a mare by Gano, son of American Eclipse, an offspring of Messenger's daughter, Miller's Damsel. Moreover, the cross through Eclipse was of special value; for not only was he a wonderful race-horse himself, but he had a strain of the blood of English Eclipse through his dam, who was out of an imported mare by Pot-8-os, son of the celebrated English flyer. When young, Lady Thorn was known as Lady Ashland, and though always noted for speed and bottom she was then fractious and often broke away from the control of her driver. Afterwards, care, patience and perseverance made her more quiet and obedient and gained for her, in her day, rank as a trotter second only to that of Doxtor. Although she once beat the "King of the Turf" it was in his younger days, before he had fully developed his marvelous speed, but a series of races between the two in 1867-8, on the Fashion Course, conclusively proved that the mare could not successfully cope with the white-legged horse. Her best time to wagon was 2m.24s., and in harness 2m.18¼s.

ETHAN ALLEN.

Ethan Allen has always stood very high in the New England States because he was the chief representative of the Morgan line and also the fastest stallion that had been trained in his palmy days. He was a small but beautifully-built horse. Although never equalling the pace of Goldsmith Maid, Dexter, and a few other marvelous flyers, he was a very rapid goer, and his action and style were as near perfection as could be conceived; but he always had a trifling objection to weight and distance. Although very enduring under favorable circumstances, his best time was made in short races, and few could get a-head of him in a burst of half a mile. He was especially great for his knack at going with a running mate, and many of his most famous contests were made in this way. He was bred by Joel Holcomb at Ticonderoga, in this State, and was got by Hill's Black Hawk, though many stoutly maintain that his sire was a colt called Flying Morgan, both these stallions having been on the same farm. His dam was a gray mare of the Messenger strain. He has been more successful in the stud than is generally known, and Honest Allen, Pocahontas and not a few other speedy rattlers attest the excellence of his get.

CONFIDENCE.

Confidence, at one time known as Fred. Pence, was a handsome, bay gelding fifteen hands high. Of his pedigree nothing definite is known. After distinguishing himself on this side of the Atlantic in a great number of contests with the fastest trotters of his day—notably with Dutchman and Fanny Pullen in 1836, with Ripton, Spangle and Dutchman in 1841, and with Lady Suffolk and Ripton in 1842—he was afterwards purchased for Mr. Osbaldeston, the "Old Squire" of English sporting history, and taken over to that country. There he was driven many years and won a number of races. His owner had so us of the best racers, hunters, and steeple-chasers in England, but for trotters he had to come to America.—[To be continued.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

PITHS.

"Early to bed and early to rise
Will make a man healthy
And wealthy and wise."

A RURAL "Cricket" will assist him.

Economy is the very soul of cookery.

Never let a child cry himself to sleep.

Keep a cake of white soap for starch.

A remedy for poison-ivy—bran poultice.

Meat should not be salted before cooking.

A good breakfast is conducive to good health.

Onion sauce made with milk is nice, served with roast mutton.

It is said that lime dusted over potatoes will prevent their decay.

A gargle of sulphur and water has been used with success in some cases of diphtheria.

Patient rubbing with sweet-oil will remove finger marks from polished furniture.

It is really wonderful how many nice dishes an economical cook can make out of odds and ends with proper seasonings.

Capers are the flour buds, which have been preserved in salt and vinegar, of Capparis spinosa, a shrub of the Mediterranean regions.

It is better to cut bread upon the table as needed than to accumulate pieces from day to day, which too often in the end find their way to the waste barrel.

To renovate black dresses: Buy ten cents' worth of soap bark—from the soap-tree, Sapindus saponaria—of any druggist; steep a while in a quart of water; strain into a basin and it is ready for use. It is best to take the dress apart brushing every particle of dust from it. With a sponge dipped into the decoction, wipe off each piece thoroughly, folding it up as you proceed. Then with well heated irons smooth and press all upon the wrong side until dry. The result of this simple process is quite wonderful—it is applicable to all black goods.

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

"How do you manage to have your bread so uniformely moist?" asked a neighbor, the other day, who had taken tea with us when our bread was six days old.

"Potatoes" I answered. Her look of surprise was such that I feel justified in giving to the RURAL readers our simple plan for having moist, wholesome bread without the need of baking every second day.

The first thing is the yeast which is made with hops, a small handful boiled and stirred into flour with a little salt, and sometimes a little ginger and brown sugar. This we make every Wednesday—keeping a fixed day, and for this extra care we are rewarded by never having sour bread. To "set" the sponge, the flour is sifted carefully, and into the center is poured the yeast thoroughly mixed with water and salt, and about a peck of finely mashed potatoes is needed for a baking a dozen loaves of medium size. This mixture is made thoroughly fine, and the ingredients when mixed (about new-milk warm in summer, and a little warmer in cold weather), poured slowly upon the flour and made into a fine batter. If at night, which is our plan, the first thing in the morning, it is again worked and set to rise, before breakfast, so that by dinner time our large baking is finished. The potatoes, without a doubt, keep the bread moist, are a healthful addition, and where cheap, as with us, effect a saving in flour of some importance.

DOMESTIC RECIPES.

Cream Cake.

One cup of white sugar; two eggs well-beaten; one tablespoonful of butter; one-half cup of sweet milk; one-half teaspoonful of soda and one of cream-of-tartar; one and one-half cup of flour; add a little salt; beat thoroughly and bake quickly in five or six round tins.

Cream.

One and a-half cup of sweet milk; one heaping tablespoonful of flour, rubbed smooth in the milk; one beaten egg; half a cup of white sugar. Boil the whole together, stirring all the time until quite thick; when cool, flavor with lemon or any extract preferred, and spread between each layer.

Bean Soup.

Boil the beans and put them first through a colander and then through a seive; season with butter, pepper, and salt.

Do all of my sister house-keepers know that the fat from fried pork makes very nice shortening for cake? We think it equal to butter. Those who send their milk to the factory will appreciate this item. W. H. S.

Corn-Starch Puffs.

Four eggs beaten separately: one cup of sugar; one cup of corn-starch; one-half cup of butter; one teaspoonful of lemon in the butter and sugar; two teaspoonfuls of baking powder mixed in the corn-starch.

Confectionary Cake.

Three cups of sugar; one and a half cup of butter; one and a half cup of sweet milk; yelks of five eggs and whites of two beaten separately (whites of three left out for frosting); one teaspoonful of soda and two of cream-of-tartar; four and a half cups of flour. Divide into three equal parts—each in a separate dish; add to one-third, one cup of raisins chopped fine; one-half cup of citron; one cup of currants; one teaspoonful each of clover, cinnamon and nutmeg; bake in layers and frost.

Orange Cake.

Three eggs; one cup of sugar; butter size of an egg; one cup of flour; one teaspoonful of cream-of-tartar and one-half teaspoonful of soda dissolved in a tablespoonful of milk; bake in three layers; put between each layer the whites of two beaten eggs with grated rind and juice of one orange and powdered sugar.

Sponge Cake.

Two eggs; one-half cup of sugar; two-thirds of a cup of flour; two teaspoonfuls of baking powder; flavor. Cut in two and put custard between. MALOMA.

Geneva, N. Y.

Scientific and Useful.

CLOCKS.

THE sun-dial of AHAZ, on which ISAIAH the prophet, by crying to the LORD, brought the shadow ten degrees backward, is the first instrument for ascertaining the time of day, mentioned in history. In early Christian ages, any device for this purpose, whether it was a sun-dial, clepsydra, sand-glass or clock, received the general name of horologium, derived from two Greek words signifying hour-teller. Down to the 14th century, the word clock, (Anglo-Saxon, *clucga*; German, *glocke*), was applied only to the bell upon which the hour determined by the horologue, was rung.

The invention of clocks, such as have certainly been in use for the last half-dozen centuries, has been ascribed, without sufficient proof, to various ingenious men from ARCHIMEDES, B. C. 220, to ROBERT WALLINGFORD, Abbot of St. Albans, in 1326. From numerous allusions to *horologia*, however, and to their striking spontaneously, in the 12th century, it may be inferred that genuine clocks existed considerably before the days of the latter worthy, and indeed there is still extant a description of one sent, in 1232, by the Sultan of Egypt to the Emperor FREDERICK the II. This, like many of the other early clocks, must have been a very ingenious but highly complicated contrivance. "It resembled a celestial globe in which the sun, moon, and planets moved, being impelled by weights and wheels, so that they pointed out the hour, day, and night, with certainty." Complexity, indeed, has been in all ages a marked characteristic in the early stages of nearly all important inventions. But while in the days of old, fond of mystery and delighting in displays of ingenuity on its own account, this complication was often regarded as a merit; in our mystery-hating epoch, when the object of all inventive ability is economical utility, it is always justly considered a defect which ingenuity and experience are constantly striving to lessen.

The first clock on record, which in accuracy of movement and simplicity of construction approached the clocks of the present time, was made for CHARLES the V. of France by HENRY DE VICK in 1370. The representation of this, however, still extant, shows that its movements were produced by a vibrating balance instead of a spring or pendulum, the latter of which was not invented until three centuries later. This important invention, like most inventions of value, is a matter of dispute; but like many other useful discoveries, it was probably made by various persons independently, and almost simultaneously, when the state of science had become ripe for it. But there is no recorded proof of its use before the discovery of GALILEO at Florence, in 1582, by observation of a swinging chandelier in the cathedral, that a pendulum vibrated in arcs of different lengths in the same time, if the arcs were small. HUYGENS, however, is now admitted by all to have been the first to apply the pendulum to clocks, in the early part of the 17th century. This application, together with the invention by his contemporary, Dr. HOOKE, of an escapement by which the pendulum was only required to oscillate in a small arc, substantially completed the method of clock-making in general use at the present day.

Many of the best clocks, nowadays, however, are driven by a spring coiled up in a barrel in the same manner as in watches which, indeed, may be justly considered as small clocks, in which the weight and pendulum are replaced by the main-spring and balance, the latter of which is composed of a balance-wheel and a balance or hair-spring. The invention, by HAUTVILLE, about 1722, of a lever escapement for regulating the motion of the scape wheel, together with subsequent improvements on his device, has rendered time-pieces of this style models of accuracy, compactness and cheapness.

To this country is due the credit of originating, about thirty years ago, the manufacture of clocks and watches by machinery—an important innovation on the old-fashioned, manual methods still almost universally in vogue in Europe. By this means greater nicety is attained in cutting out the various parts than is possible by the slovenly hand-labor of transatlantic craftsmen. Moreover, the polishing of the leaves of the pinions and the teeth of the wheels, as well as the grinding of the face of the pallet-stones to their proper angles, are processes that are performed with much greater facility and accuracy by the use of machinery than by hand; while the various parts, being made to a gauge, can be readily, cheaply and accurately replaced in case of injury by use or accident. So admirable for accuracy, durability and cheapness are the time-pieces made in this way, that English clock-makers loudly complain that they are yearly losing many branches of the horological trade through their inability to compete not only in foreign, but even in their domestic markets, with the cheaper and better productions of our manufacturers. A forcible illustration of this truth was offered, a couple of weeks ago, by a large shipment of American machine-made watches, bought, after careful examination and competition, by the English Government for the use of engineers and conductors on its railroads in British India.

The beautiful "Cricket" we are offering as a liberal premium to our friends, is an admirable specimen of the best type of manufactures of this kind. Compact, portable and elegant, an accurate time-keeper and a graceful ornament, it combines the best merits of the clock with those of the watch. Inclosed in a sparkling case of nickel-plated metal, its works are dust-proof, while its construction obviates the frequent annoyance from mislaid keys, and renders it equally accurate placed in any position. Like its cheery little namesake, it is equally at home in the kitchen, the parlor, the dining-room, dressing-room, bedroom, and library; in the poor man's cottage or the mansion of the prosperous.

Everywhere.

RURAL SPECIAL REPORTS.

NORTH BASP ISLAND, Ohio, Feb. 3, '78.

I HAVE seen reports in your valuable paper from nearly all parts of the country but this; and thinking a few words from this locality would not be amiss, I pen you a few lines from one of the vine-clad isles of Lake Erie.

Up to January 29th, the weather was warm and pleasant, not enough snow to cover the ground, while the lowest temperature for the month was 13° above zero. At this date, however, the weather has taken a decided change—wind blowing a gale from the northeast, accompanied with snow, which indicates that winter has begun in good earnest. This island is situated in Lake Erie, and in the northwestern part of Ohio, only a few miles from the Canadian line. It contains about 800 acres, mostly cultivated in grapes of different varieties—Catawba being the standard. In winter it is somewhat isolated and lonely, but we manage to pass the time very pleasantly, reading the RURAL and other good papers and books; and in summer it is a delightful place to live in, surrounded by the crystal water of the lake, and refreshed by its balmy, bracing atmosphere. C. C.

RANDOLPH, Vt., February, 11, 1878.

THE winter so far, has been unusually pleasant and mild. There have been a few very cold days when the thermometer stood at 20°, and two days on which it ranged for a few hours at 30°. Very little snow has fallen. February 1st was a very snowy day, and Sunday, the 10th, was another, but the snow-fall was not more than six or eight inches at either time. From the 2nd to the 9th it was glorious, bright, pleasant weather, like the 1st of April. Market prices are still very low for all kinds of produce. Hired help is very plentiful. Farmers all hold back from hiring till they see what the prospects for the coming season are. Kitchen help still cling to high wages, three dollars per week being what they intend to receive; but wives and daughters will do their own work before they will pay such prices for outside help; so it may prove a blessing in the end. Hay and water are abundant this season, so of course, stock is looking well. R.

Entomological.

THE CODLING MOTH (Carpocapsa pomonella.

S. B. PECK.

THE remedies for the progeny of the Codling Moth, in the RURAL of 15th December last, appear to me to be akin to the directions given by the Yankee to the woman who had bought a package of his flea powders, before being informed how to use them. "Take him by the nape of the neck and tickle his tail with a feather, and when he opens his mouth to laugh put in a dose." The Frenchman's remedy is more scientific, and doubtless more effectual—"Take him by de leg and put de poudre on de head, and if that don't do, take de hammer." Up to the 15th when the RURAL gave us the two recipes, we had no reliable remedy; the insect increasing on our hands in spite of all efforts. There may have been some local reductions in the census of numbers, but the pest is on the general increase, if we may judge by the apples brought to market from year to year. Millions of the larvæ have been caught in the traps that have been invented, and this certainly must have had the effect of lessening the number that there would otherwise have been, but the present outlook is that the apple is destined to become a luxury, even if sound specimens do not become extinct; for the whole world of entomologists, pomologists, horticulturists and experimenters has thus far failed to abate the nuisance.

Some three years since the question arose, whether the worm remained in a single fruit during its larvahood, or whether it emigrated from apple to apple seeking "pastures new." I have not had a doubt that the latter was true, and those who take the negative of the question have been unable to convince me that I am wrong, or even to raise a doubt in my mind and unless they can refer me to repeated experiments and give other reasons than a mere denial I shall continue obdurate. The larvæ have certainly been caught in the passage from one apple to another, being partially in two at the same time. A great many experiments have been made by taking a worm from one apple and placing it in contact with, and even in proximity to another, which it has been seen to enter. Sound apples have been marked and put in a package with infected ones, and found wormy by the next day; and it frequently occurs that apples are found that the worm has only partially entered. Nearly half of all the apples on a young tree (the Pound Sweet) were found in this condition. The man who didn't "believe a word of it" is by no means an anomaly. The Pope didn't believe the world moved; he hadn't been so taught. In the case under discussion the man who said it was "erroneous," and who experimented by mixing wormy and sound apples and failed to show any emigration expects by this means to upset the evidence of those who succeeded in observing a contrary result, thus inventing a new rule of evidence.

There is much circumstantial evidence—too much for insertion here—to substantiate the affirmative of this question, besides there is more direct testimony to the same effect. If I am questioned as to the merits of the case, I reply that in all questions of any importance the truth is worth knowing; and in this particular case, the question is whether we shall watch the appearance of infected fruit and destroy it and its occupant at once, and thus prevent not only the increase of the insect but the destruction of a dozen to fifty more sound apples, or whether we shall rely upon obsolete theories and content ourselves with the idea that it is but one apple anyway. Many have claimed to have greatly diminished this pest by keeping hogs or sheep in the orchard, to eat the fallen fruit, and I begin to think there is something in it. Not that they destroy many of the insects, for the tenant of an apple is generally about as sure to leave it before it falls, as rats are to desert a sinking ship; but there are certain scents or perfumes that are distasteful to certain insects, and if hogs or sheep have any very decided effect in diminishing the number of these pests, it must be in this way.

A SIMPLE METHOD OF DESTROYING THE PHYLLOXERA has just been published, in pamphlet form, by Madame AMENA DE BOMPAR, of the Canton of Plessac. According to her experience, all that is needed to insure this happy result is to set strawberries at the foot of the vine-stocks. These plants, in her neighborhood, at any rate, are infested by a spider of the genus Trombidion, whose business and pleasure it is to devour both the phylloxera and its eggs with such a ravenous appetite that the reproduction of the pest in its vicinity is scarcely possible. Practical experts in France, however, receive the announcement of this discovery with such incredulity that the labors of the Phylloxera Commission are hardly likely to be discontinued.

Trees, Seeds, Plants, &c.

VICK'S FLOWER AND VEGETABLE GARDEN.

is the most beautiful work of the kind in the world. It contains nearly 150 pages, hundreds of fine Illustrations, and *six Chromo Plates of Flowers*, beautifully drawn and colored from nature. Price 50 cents in paper covers; $1 in elegant cloth. Printed in German and English.

Vick's Illustrated Monthly Magazine.—32 pages, fine Illustrations, and Colored Plate in every number. Price $1.25 a year; Five copies for $5.

Vick's Catalogue—300 Illustrations, only 2 cents.

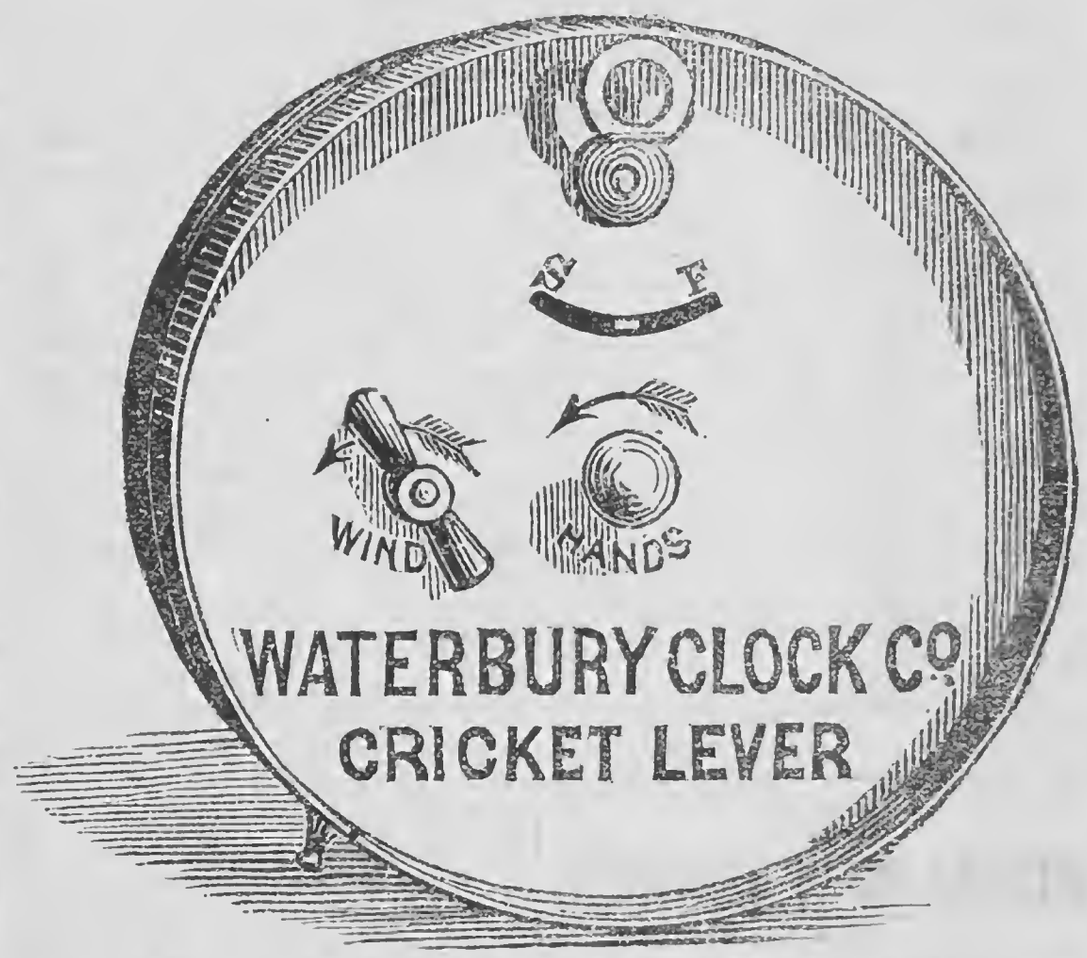
THE OFFER ALL THAT IT IS MADE TO APPEAR AND MORE.



The Cricket for Two New Subscribers.

IT COMBINES THE BEST FEATURES OF BOTH CLOCK AND WATCH, And May be Carried from Place to Place in a Trunk or Valise.

Please return at our expense if disappointed, and we will promptly refund the money.

We want the Rural Cricket Clock in the Home of Every Subscriber.

THE MOST BRILLIANT OFFER MADE BY ANY JOURNAL.

On page 130 may be seen an accurate portrait of the "Cricket" in so far as it can be presented in an engraving. The cut on this page is merely a photographic enlargement of the back, to show its actual size as nearly as our page permits. It is one inch larger in diameter.

ITS BEAUTY, COMPACTNESS,

elegance of form, depth and finish can not be shown by any engraving. It must be seen to be appreciated.

To judge by its appearance many who have not seen it before, estimate its value to be ten dollars.

We have been enabled, through the facilities afforded by our Experimental Farm (owned and operated exclusively for the benefit of RURAL readers) to make a FREE GIFT to our subscribers of a collection of rare and valuable flower seeds which have been enthusiastically received; and this gift on a still more liberal scale, *will be repeated during the present year.* Meantime, the RURAL itself has been enriched in all its departments, by the contributions from the best writers and life-like illustrations, demonstrating that our enterprise has not been at the expense of the paper.

This policy has been responded to by our patrons so liberally in subscriptions that we have decided, after a careful consideration, to make one more offer that shall

ECLIPSE EVERYTHING!

The "Rural Cricket" is inclosed in a beautiful circular metallic case of a single piece, and therefore without a seam, which is nickel-plated. The face of the clock is white and has a "second" dial as in watches. The works are securely inclosed so that no dust can penetrate and harm their movement. It is like a stem-winding watch, in that it requires.

NO KEY TO WIND IT!

and the hands are regulated without being touched. It runs thirty hours, is a chronometer-balance lever, jeweled, and it is guaranteed to keep as accurate time as the best watch.

IT RUNS IN ANY POSITION,

on its face, on its back, standing up, lying down, on its side, in short, in any position.

SIMPLICITY, ELEGANCE, DURABILITY.

Only after much negotiation with the world-renowned manufacturers, have we been enabled to offer our friends a present which exactly met our wishes and one which all will want, no matter if there are a dozen clocks in the house besides.

It may be secured without any more effort than is required to tell its merits to a friend or so, and a sample clock will enable anybody so inclined to dispose of hundreds in a week.

THE OFFER.

FIRST.

Two New Subscribers

secures the clock! The lowest price of the RURAL NEW YORKER, except in clubs, is $2.50. Therefore upon the receipt of $5.00 and two names the sender is entitled to ONE "RURAL CRICKET."

SECOND.

We will send the RURAL NEW YORKER for one year and the Cricket Clock to ANY ONE upon the receipt of $3.50.

RURAL NEW-YORKER, 78 Duane St., N. Y.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street New York City.

SATURDAY, FEBRUARY 23, 1878.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

WE begin, this week, the first of occasional articles entitled "Talks upon the Prairies." If the name of the writer were given, they would command, no doubt, an interest from the first that, without it, we feel assured, their own merits will ere long secure.

THE article "Noted Trotters," on another page, is the first of a series that will extend through several issues, and be carefully illustrated with faithful portraits of celebrated animals.

VALUE OF EXPERIENCE.

WHILE we were sitting in the cabin of a Fulton Ferry boat, a few mornings ago, one of the oldest and most prominent of New York's successful merchants entered and took a seat opposite. Very naturally he was the subject of remark of gentlemen near us. One observed, "There is nothing in the physiognomy or general appearance of Mr. A. that would lead a stranger to suppose he was possessed of more than ordinary ability. Wherein does his strength lie? for that he has it, his success proves". "I'll tell you, my friend," said another, "he has had a large experience in his line of trade, and has profited by it."

This led us to consider how little men in general treasure the lessons they learn every day of their lives, and what an amount of practical knowledge, synonomous with worldly wisdom, they might acquire if they would only store up in memory, to be used when wanted, the knowledge thus gathered from their own experience as well as from the experience of others.

What is experience? Simply the result of experiment. These experiments may be made by ourselves or we may profit by the labors of others. The child is attracted by the light and stretches out his little hand to grasp it. The experience of unsuccessful trials teaches him it is beyond his reach. A hundred or a thousand experiments serve to instruct him how to judge of distance. This is one illustration. You cannot think of anything accomplished by your work to-day that is not another, if you choose to use it as such. But the experiments may have been made by others and you are profiting by their experience. Why do you plant one crop on a certain soil and for another select a soil made up of different constituents? Why one on upland and the other in low ground? Because somebody, sometime, experimented and imparted the results of his experiments to others; and you have been instructed therein.

Man's reasoning faculties are of much service in this connection, and he who uses them most will reap the most advantage. The organs of Comparison and Causality, aid materially in experimenting, and logical conclusions are often as good as hard work. Combined with Constructiveness, they may be called the father of invention, of which necessity is said to be the mother.

That results are sometimes obtained by accident, is true; but may not such be called experiments made unintentionally? Some years ago, a leading Horticulturist imported one very rare and costly lily bulb. He prepared with great care, a place for planting it, and stepping back, placed his foot on the bulb and crushed it. Vexed at his carelessness, he gathered the scales, threw them into the hole, covered them, and left in disgust. After proper time, he had not one but many lilies, and examination showed him that nearly every scale had thrown out roots and was commencing life on its own account. This experience, the result of accident, he turned to valuable account in after years.

Experience is also, to a large extent, inherited, and we are indebted to all the generations since the beginning of the world. If we do not directly inherit the knowledge required to perform certain things, we certainly do inherit the capacity of acquiring it with facility. If the mind of the infant at birth (as is claimed by some) be a blank, that blank will be much quicker and better filled in the child whose ancestors have been educated; for education may be said to bear the same relation to experience as experience does to experiment—education being only the sum of experience.

OUR VIEW OF IT.

IN the RURAL NEW-YORKER of Feb. 2, Professor BEAL, of the Michigan S. Ag. College, gave an account of tests with seeds obtained from various sources. Fifty seeds of each variety were planted, and a considerable difference was shown in their germinative powers and consequent value. The reader, however, is referred to the article itself for particulars. We have received a number of letters touching this article, some of which thank us for the valuable information it contained—others regarding it as an injustice to seedsmen generally. One gentleman of some prominence asked us if we were not afraid that the RURAL would lose the advertising patronage of seedsmen if it persisted in such a course.

We should dislike to lose the advertising patronage of any respectable, fair-dealing establishment that has hitherto favored us with its orders. Neither should we like to prejudice ourselves in the eyes of the future seedsmen who shall take the place, or swell the list of the seedsmen of to-day. And yet we do "propose to persist in just that course."

People advertise with us and pay the prices we ask, for the reason that they presume it to be to their interest to do so. And we are glad to have them, because the income thus derived assists us greatly in defraying the entire expense of making the RURAL all that we aim to make it. There is no obligation whatever on either side, except that which naturally springs up between those who habitually deal with one another in an honorable manner. Our obligations are to our readers, and we believe that those journals which most assiduously study to benefit their readers, are those which should, in the end, prove most serviceable to advertisers—a view which the crowded state of our advertising columns seems to justify.

The RURAL Horticultural and Agricultural Grounds, as we (perhaps rather grandly) call them, contain hundreds of hardy plants of various genera. During the warm season, everything in the way of novelties or of other plants whose merits are differently estimated, are tested in so far as, with our facilities, we are enabled to test them. With what object? Many of these are sent to us BY advertisers, with the request that we will try them and state our opinion of the result. Are we to understand that if our reports be unfavorable, they will withdraw their advertising patronage? Are we to consider the gift of a new grape-vine—of a paper of seeds, or of some new thing, as *purchasing* a favorable notice at our hands, whether the article be all it is represented to be, or not worth a tithe of the trouble it will cost us to test it? A fine way, indeed, for a "pretentious" journal to engage the confidence of its subscribers and readers who are those to be influenced by our reports and who purchase of the advertiser accordingly!

If any test with seeds or plants published in these columns should do injustice to any seedsman or nurseryman, we should regret it exceedingly. Therefore every care is exercised to render its occurrence impossible.

IN Prof. BEAL'S experiments above referred to, we do not suppose his good faith or accuracy will be questioned. Seeds were procured promiscuously from prominent houses, and his results cast no more a reflection upon those named in the report than upon the hundreds of other seed-concerns about the country. We believe that all seedsmen who entertain a stronger regard for fair-dealing and the good repute of their occupation than they do for a short-lived thrift, will respect all such honest efforts to benefit the agricultural or horticultural community. Those who take a different view of it, may discontinue their advertisements with us, it is true.

No reasonable person will expect that the seeds collected by seedsmen for sale, will average as good as those collected by individuals for private use. The latter take time to pick out only the ripe, solid seeds, while the former, of necessity, collect them *en masse*. They could not otherwise afford to sell seeds at present market prices. Some seedsmen are more careful, more conscientious than others. Some raise their own seeds or a large part of them; others purchase of wholesale dealers. The question is: Where does fair-dealing end and unfair dealing begin? What percentage of fresh, perfect seeds has the purchaser a right to expect for the money which he pays?

Some seeds are as good the second year as the first—some are better—some are worthless. The seedsman should know about this. If not, he has no business to be a seedsman. If, knowing this, he disregards it, whose duty is it more than that of the horticultural or agricultural press to expose the deceit? But "you may lose their advertising patronage!"—Aye, there's the rub! It's more than a *rub*. Advertising patronage is the *soul* of the journal of the period, is it? Let us see. Oh! Ceres—Oh! Pomona—Oh! Flora—What *are* you thinking about! Oh! Professor BEAL, see what you have done! Ah! Woe is us!

A SQUARE OFFER.

WE may have a special premium to offer next year to our friends. And we should wish them to believe that we are incapable of exaggerating the merits of such premium for the purpose of enlisting their interest in our favor. If now the RURAL Cricket should not prove all that we represent it to be, our readers would be justified another year in accepting our statements for what they may be deemed to be worth. In order, however, to appreciate it, our readers should know that the price of the clock has been fixed at $2.50, so that an immense sale should compensate the manufacturers for a very small profit. It *looks* to be worth four or five dollars and a knowledge of its good qualities confirms the impression.

Knowing this ourselves, we guarantee our friends against cause of dissatisfaction by *agreeing to take the clock back and to refund the money promptly* if, upon examination, it shall not prove all we represent it to be. It will be seen by reference to page 123, that in connection with one subscription to the RURAL it will cost but one dollar, and that for two yearly subscriptions, it is offered as a present outright! In answer to the natural query why we did not make this offer earlier in the season, we reply that we have not felt before that we could afford it.

The Sword of Damocles.—All know the story about the ancient tyrant Damocles: how having been congratulated by a toady on the enviable happiness of his exalted position, he invited the sycophant to a banquet, where despite the innumerable dishes of the costliest viands placed before him, the wretch's position was rendered unutterably miserable by the sight of a naked sword suspended by a single hair, directly over his head. Somewhat like this, during the past week, has been the predicament of Europe. While, with a couple of exceptions, all the nations therein were regaled with the bounteous gifts of peace, all felt that every hour was big with a war that might, ere long, suddenly wrap the entire continent in its sulphurous blaze. While its devastating progress could not be otherwise than disastrous to humanity; its issue, though it might change the map of Europe, and perhaps that of Asia, could hardly have been advantageous to civilization. For the present the impending terror has been veiled, but it may reappear only to fall with tragical effect, at any moment the flush of victory and the greed of aggrandizement or the dread of loss and humiliation may determine.

BREVITIES.

OUR subscribers when they meet ask: "How do you like the RURAL'S "Cricket?"

WE see that many of the oranges shipped from Florida are packed in Black Moss, Tillandsia Usneoides.

NEXT week we shall present our readers with a first page engraving of a remarkable specimen of the Weeping Spruce.

WE should have said, in speaking of Abies excelsa elata, that it originated in the nurseries of the PARSONS of Flushing, L. I.

PROF. TYNDALL concludes that putrefaction is impossible without germs, and that absolutely pure air is a preventive of fermentation. It is not the air which corrupts, but it is the matter in the air.

HAVE you decided what vegetable seeds you are going to plant in your garden next spring? Now is the time to send for catalogues. Send for those announced in our columns, read them and then—hand them to your neighbor.

THE Husbandman of Elmira, one of our favorite exchanges, devotes over seven solid columns to the able address of Prof. G. C. CALDWELL of Cornell University delivered before the N. Y. State Grange. Subject "Phosphates."

MR. GEO. SUCH, who brightened our sanctum with his presence a few days since, has not so surrendered himself to rare hot-house or conservatory plants that he can not see in the Gladiolus one of the most beautiful of flowers. He advocates planting the corms very early in spring.

"KITTATINNY" WILLIAMS. So Mr. E. WILLIAMS of Montclair, N. J., is often called by old friends; and it is a "familiar" name of which he need not feel ashamed. If every one of us "horticulturists" were to introduce a variety of fruit as valuable as the Kittatinny Blackberry is universally acknowledged to be, we might congratulate ourselves that we had not been horticulturists in vain. Mr. WILLIAMS is the hard-working, efficient secretary of the N. J. S. Hort. Society.

IT will be seen that the lowest cash price of the Cricket is $2.50. All who see it think that it is worth at least twice as much. The lowest price for the RURAL, except in clubs, is $2.50. Anybody sending us one new name for one year gets the clock for $1.00. May we not hope that every one of our present subscribers will secure it? It is a neat ornament for the sitting room or parlor—bedroom or office—for the student or professor. It combines all the good qualities of watch and clock, is not deranged by a knock or even slight fall, may be carelessly handled and carried from place to place.

MR. CHARLES DOWNING states, in the N. Y. Tribune, that there is no doubt that in deep, rich soil trees succeed better in grass, but in poor or moderately rich soil, it is best to keep the trees in thrifty condition with sufficient enriching material and clean culture. His experience in his own locality (Newburgh, N. Y.,) is that the blight affects trees in all soils and under all conditions, and, so far as he knows, none of the theories or cures has been successful. In his locality the pear blight has appeared at intervals of about twenty years, and the duration of each has been from three to five years. He has passed through three of these periods, and with each additional visit the attack is very much lighter, and it may, he thinks, run itself out in time. Let us hope so.

BUSINESS NOTICES.

SEE Mr. MINER'S adv't of White Grapes and other fruits—something new and valuable.

Literary Miscellany.

LOST.

A WILD rose, by the wayside hung
  Dew-glittering, on the morning air
A pure, scarce conscious, perfume flung;
  I looked, and found the flow'ret fair—
So fair, I sought with sudden zest
To wear its beauty on my breast.
  The trembling petals at my touch
A sweeter, subtler fragrance shed;
  'Tis strange I loved that flower so much,
    And—it was dead.

In that high mood when thought hath wings,
  And finds alone its speech in song,
I struck an old harp's slumbering strings,
  And drew an idle hand along;
Nor deemed the careless chords had caught
The life-note that my spirit sought.
  Till sudden on my startled ear
Its dream-created accents woke.
  Alack! I bought the rapture dear—
    The string had broke.

I heard a wild bird on the shore,
  Singing a wild song to the sea;
And bold the burden that it bore,
  And sweeter than all else to me—
So sweet, I caged the bird to hear
His magic minstrelsy more near.
  Untamed the captive's swelling throat
In one sad song his whole soul cast:
  Too well I knew his loveliest note
    Had been his last.

And yet while memory hath power
  To count the hours too vainly spent,
The fragrance of that faded flower,
  That harp's last dying music, blent
With the wild bird's weird death-song, will
Haunt every waking moment still,
  Teaching my heart the bitter cost
Of all the eye of hope hath seen,
  Of all that life hath won and lost—
    That might have been.

[*Tinsleys' Magazine.*

POPE PIUS IX.

THE news of the death of Pope Pius IX. flashed by the lightning over continents and under oceans, on the evening of the 7th inst. smote with a sense of personal bereavement on the hearts of 200,000,000 members of his Church, who sorrowfully felt that by the departure of the venerable Pontiff they had lost what the word, Pope, really signifies—a father. Nor was sadness at the event confined exclusively to the vast Roman Catholic body, for not a few of the adherents of other creeds, while repudiating the doctrines of which the dead high-priest had been the representative had learnt to admire the simplicity, amiability and benignity of the deposed sovereign, as well as to respect the quiet firmness with which he adhered to what he considered his duty, and experienced a natural regret at the removal of a good man from a prominent position in a world which is lamentably in need of good men in exalted places.

Giovanni-Maria Masta-Ferretti was the youngest of the seven children of Count Girolama Mastai-Ferretti and Countess Catarina Saluzzi. He was born on May 13th, 1792, at Senigaglia, on the west coast of Italy. In 1803 he began his classical studies in the College of Valterra, suspended them in 1808 in consequence of frequent epileptic attacks, and on the abatement of the malady in 1809, he received the clerical tonsure and went to Rome to study theology. On the following year he returned to his native place where he continued his studies under his maternal uncle until 1814, when he repaired to Rome where he received "minor orders," and was ordained priest in 1819. In 1823 he was chosen Secretary to Monsignore Muzi, apostolic delegate to Chili, where he chiefly busied himself with ministering to the Indian population of the interior. On his return to Rome, in 1825, he became domestic chaplain to Leo XII, and in 1827 was nominated archbishop of Spoleto and Perugia. In 1832 he was made archbishop of Imola and on December 23, 1839, he was created a Cardinal, and after the death of Gregory XVI., June 1, 1846, he was selected Pope on the 16th of the same month.

Immediately he began a thorough system of liberal reformation in the States of the Church, dismissed the foreign troops, reduced Papal household expenses, abolished pensions, taxed benefices and wealthy church corporations, reduced taxes, chartered railroad and telegraph companies, stimulated home manufactures and encouraged the formation of agricultural societies. He set about draining marshes, establishing reading-rooms and mechanics' clubs, patronizing scientific congresses, educating tradesmen's and workmen's children, and providing free lodging-houses for the poor and homeless. Encouraged by his liberal tendencies, the republican advocates all over Italy, the secret societies, the liberal adventurers, artistic and political, who make Rome their headquarters, commenced a series of agitations in that city and the surrounding petty States, that alarmed the local Arch-Dukes and Princelings, and resulted in numerous assassinations in Rome, the imprisonment by mobs of the friends of the Pope, and finally a fierce insurrection and the flight of the latter, in the guise of a common priest, to Gaeta on November 15th, 1848. On April 25th, 1849, a French force landed at Civita Vecchia and marched upon Rome, while the Austrians invaded the northern and the Spaniards the southern provinces. On July 1, the short-lived Republican Government that Mazzini, Garibaldi & Co. had established in the Eternal City, capitulated, and the Pope re-entered the city on April 12th, 1850. During the late troubles his progressive tendencies had been thoroughly checked, and on his restoration the reactionary policy of Cardinal Antonelli, his Secretary for Foreign Affairs, became dominant in his council.

The later history of the Pope and the Papacy is too familiar to our readers to require recapitulation here, nor is there space for detailing the various steps which led to the final abolition by Victor Emmanuel, in 1870, of a sovereignty founded by Pepin The Short of France, in 755, and confirmed and enlarged by his son and successor Charlemagne, in 774. H.

POPE PIUS IX.

CORA.

CHAPTER 2.

Timely Succor—Treasure Trove.

WHEN Cora found herself separated from her brother by the sea of eager, intent faces, many of which wore an expression which terrified her, her first feeling was one of uncontrollable terror, during which she could hardly refrain from shrieking aloud. She could see above the other heads Harold's waving golden hair, and pale, agonized face; could hear dimly through the noise his words of encouragement, and she refrained from adding to his terror for her by any cry of her own; but she felt, with increasing fear, that every moment increased the distance between them, and that burdened as he was, it was almost, nay, quite, an impossibility for him to force his way to her. Cora was not without some courage of her own, but it failed her now, and she was terrified beyond measure.

"Oh! Hal—Hal," she said, as she tried to choke back her sobs.

Dreadful as the crowd had been before to the young girl, it was ten times more so now. She could hardly breathe, and it was only by the strongest effort of will that she kept herself from fainting. How she missed the close guard of her brother's arms, the reassuring clasp of his hand, the brave, gentle face bent over hers, the tender voice murmuring words of cheering encouragement! Her brain seemed in a whirl of terror and bewilderment, and she thought that she must die here, crushed to death under the hundreds of cruel feet.

But help was nearer than she could have hoped, and a few minutes gave Cora a more experienced and efficient protector even than her brother could have been. As she stood, pale, trembling, helpless, large tears following each other swiftly down her soft cheeks, there came a quiet voice close beside her, whose musical intonation she noticed even in her terror.

"Will you trust yourself to me?" it said, very gently. "I can help you if you will."

Cora glanced up, and saw bending over her a face of singular and rare beauty—a face forming a striking contrast to the coarse, repulsive countenances which surrounded her, and one on which her eyes rested at once with a feeling of relief and trust.

It was the face of a man of Harold's age, or it might be a little older; and as it bent over Cora with an expression of pity in the dark velvety eyes, she thought then, as she thought afterwards, that it was the most beautiful face she had ever seen.

The features were clearly and well cut, beautiful in themselves, and lighted by dark velvety smiling eyes; dark waving hair was parted over a brow of marble whiteness, and the well-formed lips were shaded by a dark silken moustache.

Most people, at first sight, took Stanley, Viscount Almane, for a foreigner, and few ever betrayed their Norman origin so clearly as he did by that handsome expressive face.

"Will you trust yourself to me?" he went on in his gentle, rather languid tones. "I suppose you have been separated from your party. Can I help you?"

"I have lost Harold," she said, trying to speak calmly. "He tried to help a poor woman who had fainted, and we got separated by the crowd."

"We shall find him again," said Lord Almane, cheerfully. "You must try and think he is with you now, and not a stranger. Pardon me."

As he spoke, with a gentle, courteous inclination of his head, he quietly put his arm round Cora, and placed her before him in such a manner that she felt the pressure least.

"Poor child," he said, softly, in a moment, as he felt her tremble. "Do not fear, I will take care of you, and we will find your companion in a few moments."

"You are very good," faltered Cora.

Nothing could have surpassed the Viscount's care and tenderness for the girl he had befriended. He was evidently well used and experienced in a crowd's temper and disposition, and though perfectly quiet, and almost languid in tone and manner, was able to hold his own easily and well. Now and then he stooped over Cora to whisper a few re-assuring words which she was almost too pre-occupied to heed, and once, when two men just near them began to fight, and use their fists vigorously, he gently and with a murmured apology, pressed the girl's face against his shoulder to hide the sight from her.

The boxing-match, however, caused a slight diversion, which Lord Almane was quick to take advantage of, while with a powerful effort, exerting all his strength, he cleverly drew Cora to the edge of the crowd, and in a moment she found herself in a little deserted alley, and free from the terrible pressure she had endured so long, while her companion, looking rather pale and still breathing quickly from the great exertion he had made, stood beside her.

"How can I thank you?" said Cora, impulsively, when she had sufficiently recovered from her agitation to speak, and holding out both hands to him in the excitement of the moment.

"By saying no more about it," he said, laughingly, "I am so happy that we have managed to extricate ourselves from those dreadful specimens of humanity. I am fond of a crowd, and have been in many, but I have rarely passed such a *mauvais quart d'heure* as the last. Are you sure you are not hurt?" he went on, anxiously, holding her hands, and looking down at her fair face with an expression of admiration in his eyes which made her lids drop. "I was terrified for you at one moment. It was only with some difficulty that I got up to you."

"It was very good of you," faltered Cora, the sweet carmine flushing her pale cheeks. "I do not know what would have become of me without your help."

"You are very weary, I fear," he said, after a moment's pause, withdrawing his dark eyes reluctantly from her face. "And this is no place for you. Can I take you anywhere?"

"I must find Harold," she exclaimed, recollecting her brother's anxiety, which for a moment she had forgotten. "He will be so anxious. How can I find him?"

And she clasped her hands and moved forward in unaffected anxiety and eagerness.

Lord Almane interposed, and detained her gently.

"I think you must let me do so for you," he said. "Will you tell me how I am to recognize this gentleman, and whether he was before or behind you in the crowd."

"Behind," she replied.

"Then he must pass here," said the Viscount, "and we shall see him. How shall I recognise him?"

"He is tall and fair," said Cora, nervously. She was beginning to feel the strangeness of her position—alone at midnight with an unknown companion in the streets of London.

"Are you afraid to remain here alone for a few moments?" said Lord Almane; but Cora's quick movement to his side and involuntary clasp of his hand were sufficient answer.

"Look," he said, smiling; "if you jump up on this accommodating old buttress you will be sufficiently elevated to see over all those heads, and you will recognize your——" he hesitated a moment, glancing down at her hand as it lay on his arm; but it was gloved, and it gave him no clue to her relationship with the lost Harold—"the gentleman who was with you."

With his assistance Cora mounted on the stone buttress projecting from one of the old houses, in whose shadow they stood. Lord Almane retained the hand he held and made it rest upon his shoulder.

For a few moments they stood in perfect silence. It was a strange sensation, the utter stillness and quiet of the dark, narrow street where they stood; the brilliance and noise of the broad thoroughfare beyond, with the moving sea of faces, and the illuminated houses on either side. Cora was almost too anxious to heed the spice of romance which mingled with the unpleasantness of her adventure, and yet she felt it was a rather odd and unusual proceeding altogether.

Suddenly she caught sight of Harold, with eager, wide-open eyes, and disordered hair, pushing his way fiercely through the mob, evidently in the greatest anxiety, and as she saw him Cora uttered a little joyful cry.

"Hal!" she cried, her clear, silvery tones rising distinctly above the hoarse murmurs around him—"Hal! I am here. Come, Hal."

Her brother heard her voice,

but for a moment he could not tell from whence it came. Lord Almane felt that the little hand on his shoulder grew unsteady.

"He does not see me," she said, tremulously; then lifting her voice again, she went on: "Hal! I am safe, Hal!"

A momentary silence, then her voice broke again upon the stillness.

"He sees me! All is well now," she exclaimed, joyfully. "Do you think he can manage to get out?"

"Of course he can," said Lord Almane, a little coldly. "A man and alone he will have no difficulty."

And then his lordship took himself mentally to task about the unaccountable feeling of annoyance her interest in "Harold" excited in his own breast. What could it matter to him?

Cora heard the change in her companion's voice, and wondered; but the wonder was soon superseded by delight as she caught sight of a tall figure striding towards her.

"There is Harold," she exclaimed, joyfully, and was about to spring down, when Lord Almane prevented her, and lifted her down with a gentle courtesy and deference, and the Viscount had the pleasure of seeing her run into the arms of the tall stranger, and hide her face on his shoulder with little cries of delight and love.

"O! Hal, I am so glad—so thankful!"

Harold bent his head over her for a moment, while she rather incoherently whispered the details of her rescue, then he came forward and put out his hand with a few simple but sincere words of thanks to Lord Almane.

"What do we not owe you!" said Harold, earnestly. "I shudder now at the thought of the danger Cora was in, and from which you rescued her."

"Your thanks embarrass me," said the Viscount, a little coldly. "Mine was the most simple act of courtesy in the world. I should have been a cur to leave it undone."

"Even that does not lessen our debt of gratitude," answered Harold, smiling. "We cannot forget it, believe me."

Lord Almane bowed. Somehow he could not fraternize cordially with the new-comer until he ascertained what was the relationship between him and the girl he had befriended.

They walked down the quiet little street and found themselves in another equally deserted.

"How are we to get home, little sister?" said Harold then. "We have missed the last train to Richmond, and I doubt if we can get a vehicle of any description."

Lord Almane's face cleared, and he turned to Harold with a sudden cordiality the other was almost at a loss to understand. "My brougham is waiting not a stone's throw from here," he said. "It is entirely at your service. Pray oblige me by accepting it."

Cora sent him a bright look of thanks from under her long lashes, but Harold hesitated. He had inherited more of his father's English and reserved disposition than his mother's expansive Italian temperament.

Lord Almane saw the hesitation, and went on quietly:

"Your sister is very tired," he said, his voice softening into a gentler, more tender intonation. "I think you ought not to refuse me."

"You are overwhelming us with obligations," said Harold. "And besides, I do not know to what inconvenience we may be putting you."

"To none, I assure you," said the Viscount, "if you will allow me to accompany you. I am staying at the 'Star and Garter' for a short time."

"If that be really the case," said Harold, "I think we must trespass on your kindness so far; but, Cora, remember that we are incurring a debt of gratitude we never can repay."

Cora's face seemed to say that she was not unwilling to owe it to such a creditor, and meeting her eloquent eyes, Lord Almane smiled a little, and came round to her side as they walked on.

"You will not care to face a crowd again," he said, in the languid, musical tones she liked so much. "This will be your first and last experience, I am sure."

"Yes," she said. "It was too dreadful, and I most sincerely repented my willfulness in making Harold bring me. I regretted it bitterly when too late."

"I do not regret it," said the Viscount, lowering his voice a little, "since it has given me the pleasure of meeting you."

Cora glanced up shyly but did not reply, and just then they came in sight of the carriage—a brougham drawn by a superb bay horse. Lord Almane put a little whistle, suspended to his watch-chain, to his lips, and the sound brought the carriage to them. A footman, in quiet, dark livery, sprang down and held open the door, not without a little surprise on his face at the friends his master had found, which expression made Cora painfully conscious that her dress was torn and dusty, her sealskin coat disordered, and that her little fur cap had disappeared entirely. Altogether she felt quite unfit for the luxurious, softly-cushioned, scented vehicle in which Lord Almane placed her so carefully. Harold followed and then his lordship sprang in, giving the coachman directions to drive to the "Star and Garter," Richmond.

"If you will put me down there," he said, "the carriage is at your disposal, Mr. Sinclair."

The drive was a pleasant one. Cora, resting back on the cushions, watched the handsome face opposite to her with a kind of fascinated admiration, although her lashes drooped every time he turned to her, which was not seldom, during the animated conversation between himself and Harold.

Very soon, it seemed to Cora, they reached the hotel, and Lord Almane took her hand in farewell, holding it a minute while he expressed his hope that she would not suffer from her fatigue, and requested permission to call.

Harold had alighted to give the coachman directions how to find The Tryst, and for a minute Cora and Lord Almane were alone.

"May I come?" pleaded the soft tones, as he held her hand in his. "Will you be glad to see me? Nay, I will not come else."

"I shall be glad," murmured Cora, shyly, a thrill of happiness she could not define making her heart beat quickly.

"May I keep this?" he went on rapidly, opening his hand, and disclosing the little crimson knot of ribbon she had worn at her throat. "I should like to have a *souvenir* of to-night. Besides, it is mine—treasure trove. I will keep it now."

He clasped her hands with a lingering pressure, and sprang out, exchanging a hasty farewell with Harold, and cutting short the latter's words of thanks. Then, lifting his hat, he stood bareheaded as the carriage drove away; and Cora's last look showed her the face, beautiful as any Greek god's, which was to exercise an influence over her future life, and to bring her some joy and much sorrow.

"Did I not tell you something would happen, *signora mia*?" said Marianna, as she undressed Cora and combed out the shining tresses.

"And did I not tell you it would be something pleasant, Marianna?" said the girl, laughing; "and it was far more pleasant than otherwise."

"Time will tell," answered the old servant, sententiously.

And when, half an hour after, she stole out of Cora's room, leaving the young girl sleeping softly, her sweet crimson lips pouted in a happy smile, Marianna shook her head a little mournfully.

"The signorina is no longer a child," she said to herself. "Well, her brother is there, and he will let no harm come to her."

Ah! Marianna, the harm was already done. Cora's eyes were blinded by the glamour of that wondrous beauty, its fascination was strong upon her even now; and as she slept, she saw again the dark, smiling, tender eyes, and felt the clasp of his hand on hers, and heard the liquid tones of the sweet, languid voice. The mischief was done!

CHAPTER III.

An Incident.—Pleasant Quarters.

The drawing room at The Tryst was a large, low, square room, with no pretensions to grandeur, and yet not without a certain artistic elegance, and some taste. It was simply furnished, and hung with gray damask, and though its ornaments were few they were well chosen, and of some value. It was lighted by a large window looking over the quaint, old-fashioned garden which The Tryst boasted, and the door, which faced the window, opened into the little hall.

It was the second day after Cora's rescue from the crowd by Lord Almane, and she was sitting dreaming over a volume of Tennyson, in the deep window seat—at least, the book was open on her lap, and her eyes were bent upon it, but for quite half an hour she had not turned a page, and there was a tender little smile playing around her lips which surely Elaine's unhappy love for Lancelot could not have brought there; and whereas we know that Lancelot of the Lake was no Apollo, the face which was in Cora's thoughts as she sat there was a very handsome one—gay, smiling, triumphant.

She was going over in her own mind the events of the last night but one. Again she heard the tender voice and felt the pressure of Lord Almane's protecting arm; again she recalled the quick yet gentle movement with which he had turned her face to his shoulder to shut out a sight which would terrify her; again she saw the pleading eyes seeking her own, and the little knot of crimson ribbon which he declared was "treasure trove;" and the innocent girlish heart throbbed with a happy ingenuous triumph which would certainly have made his lordship smile could he have known it.

Cora was aroused from her reverie by the sound of voices and steps in the hall, and she rose to ascertain the cause of the unusual commotion, when the door of the room in which she was, opened hastily, and Harold entered.

"Do not be frightened," he said, hurriedly; "Lord Almane has met with an accident, has been thrown from his horse, and is hurt, not seriously, I hope; they are bringing him here."

"Lord Almane!" repeated Cora, mechanically.

"We shall want your help, so be a brave girl, went on her brother. "Run and find Marianna, and then come back here. Bring some eau-de-Cologne with you."

Cora ran off, her face very pale, and her heart full of an undefined fear and foreboding. Marianna, was out, and the only other servant at The Tryst was a young, inexperienced girl, who seemed startled out of her wits, and Cora felt a little nervous at the thought that if a woman's help were needed, she must give it. Hastily fetching a bottle of eau-de-Cologne from her room, she went quickly downstairs, softly opened the door of the drawing-room, and entered unobserved.

Harold was the first person she saw. He was standing at the head of the sofa where Lord Almane lay, while a groom in livery, with a very startled face, stood near, apparently receiving Mr. Sinclair's orders, although too much frightened to clearly understand Harold's rapid directions about a doctor and the nearest place to find one.

Lord Almane looked very pale, his eyes were closed and his lips set, while his head lay back upon the cushions in a helpless manner. He opened his eyes languidly as Cora entered, but his face brightened when he saw who it was, and he made a movement as if to rise, but sank back again on the pillows, a spasm of pain contracting the handsome features.

"I must apologise, Miss Sinclair," he said, smiling. "What will you say to such an invasion?"

Cora's face was eloquent as she came to his side, and put her hand into his outstretched palm; but though she tried to say a few words of sympathy, her voice failed her.

Silent as her greeting was it seemed to satisfy Lord Almane, for he smiled contentedly as he rested back on his pillows.

"I am afraid you are suffering much," said Harold when the servant had disappeared.

"Hardly at all *now*," answered the Viscount, with an emphasis on the last word which did not escape Cora. "I don't think there has been much damage after all. This arm is broken, I think, nothing more."

"Broken!" echoed Cora, affrightedly turning very pale.

"That is not much damage to proceed from such a fall as I have had," he said, smiling at her. "My horse stumbled, and I must own to having been very preoccupied, for the next thing I remember is that your brother and Giles carried me in here."

"You were riding in a very heedless fashion," said Harold, re-arranging the cushions which had been disturbed by the movement Lord Almane had made when Cora had entered. "Lord Almane's horse stumbled," he went on to Cora, "and he was thrown with some violence against our garden wall. A very serious hurt might have ensued."

"I am sorry that my carelessness should put you to any inconvenience," said Lord Almane. "I trust, for your sake, the medico will say that I can go back to the hotel."

"Were he to say so fifty times we could not permit it," said Harold, smiling; "although I fear our simple life and customs will not give you your ordinary comforts."

Cora, recalled by her brother's words to a sense of her duty as hostess, went away to see that a bedroom was prepared, and without hesitation chose the large one which had been her father's, and which was now quickly got ready.

When she returned to the drawing-room Harold was impatiently awaiting the surgeon's arrival, and blaming himself that he had not gone in search of one instead of trusting the servant.

"Surely he could have brought some one by this time," he said. "Every doctor in Richmond cannot be out. Stay with Lord Almane, Cora; I will go and see for one."

Cora looked startled, and parted her lips as if to speak; but before she could utter any remonstrance Harold had disappeared.

"Don't be afraid," said the Viscount, smiling. "I promise not to faint, Miss Sinclair. But run away if you like; I shall do very well alone until the surgeon comes."

Cora colored and came slowly near the sofa.

"I am not afraid," she said, simply. "Can I do anything for you, Lord Almane? I am afraid you are suffering a great deal more than you say."

"My arm is rather painful," he owned, "and my head aches. Don't look so pitiful, my child. It is not worth one moment's anxiety."

"Will you let me bathe your temples a little?" said Cora. "I will not hurt you. I am used to doing it for Harold when he has a headache. I think it will relieve the pain."

"I cannot trouble you to do so for me," he replied.

"It is no trouble."

And very simply and naturally she proceeded to bathe the throbbing temples; and after a few minutes' patient work she was rewarded by seeing the handsome features relax and lose some of their set look of pain.

"That is so much better, think you," he said, opening his eyes to see the fair face, with its angelic look of pity, bending over him. "There must be some magic in your touch, Miss Sinclair! The throbbing is almost gone."

"I am so glad," she answered, without pausing in her graceful task, until the sound of footsteps announced the arrival of Harold and the anxiously-looked-for physician.

"At last!" said Cora, joyously. "Now you will be better, Lord Almane."

He smiled; and then, as she rose, he put up his uninjured hand, caught hers, still wet and perfumed with the scented waters she had been using, and drew it for a moment passionately to his lips with a tender murmur of acknowledgment.

Cora drew it quickly away, and turned from him as the door opened to admit Harold and a stranger.

As they passed in, Cora drew back, and then swiftly and silently left the room.

In about an hour Harold joined her in the dining-room. Lord Almane was in bed, he said, his arm set, and going on quite satisfactorily; Marianna was with him.

"He was coming here when he was thrown," went on Harold. "I am happy to be able to repay the debt of gratitude we owe to him, Cora. We must try and make it less tedious for him. Why, what is the matter, little sister? You're as pale as a ghost yourself, and trembling. You have been startled, and must go and lie down and compose yourself. I can't have two patients in one house!"

"No fear of that," answered Cora, laughing, as she threw her arms round Harold's neck and kissed him with unusual passion. Then, wishing to avoid his questioning glance, she escaped from the room up to her own.

The unexpected advent of such a guest could not fail to cause some little excitement in such a quiet, uneventful household as that of the Tryst. Harold, who spent most of his spare time with Lord Almane felt the pleasure of such constant association with a traveled and cultivated companion; and, though for a few days the Viscount suffered acutely from the inflammation which set in on the second day of the accident, he seemed to find equal satisfaction in the society of the young artist.

Even the servants seemed excited and interested in the young nobleman; Marianna herself succumbing to the powerful fascination he exercised over all around him.

During the first week Cora heard nothing except Harold's daily bulletin or Marianna's occasional report, the old woman being very curt and business-like in her replies to any questions the signorina seemed anxious to have answered.

Sometimes during his daily visit Dr. Tapley came into the drawing-room, and gave the young girl some news of his patient; but of the Viscount himself Cora saw nothing, and Marianna's quick eyes saw, what Harold in his pre-occupation with the invalid failed to see, that the young girl was restless and ill at ease.

One afternoon Harold received a business summons to town, and before leaving came into the drawing-room, where Cora was sitting, playing some dreamy chords on the piano.

"Lord Almane is getting up," he said, rather uneasily. "I don't know whether he is quite up to it, but Dr. Tapley has given leave. Don't let him talk too much, Cora; he's far from well yet. Good-bye, little sister."

Cora stood at the window watching her brother as he went down the garden; her face a little flushed, and a sudden gleam in her gray eyes.

Harold, turning as he went, saw her, and was struck with a sudden sense of her wondrous beauty, which gave him an undefined feeling of mingled pride and uneasiness. She was dressed very simply in dark-gray; but the flush on her cheeks, the sudden brilliance in her eyes, made her radiant just then, and her loveliness came with fresh power before Harold's eyes; and as he walked swiftly down towards the station, he carried away a very fair vision.

And it was a very fair vision which met Lord Almane's gaze as he entered a few minutes after, and Cora turned from the window to greet him. He was looking very pale and worn; so much so, that Cora started at the change, and pushed forward a large, deep arm-chair.—[To be continued.

An Amusing Comedy of Errors.—Mme. de V. was very jealous, and determined to watch her husband. One day he told her he was going to Versailles, and when he went out, she put on her bonnet and followed him. She kept him in sight until he turned into a passage which shortened the way to the railroad station, where she missed him. She stood for a few minutes in the passage looking about, and suddenly saw a man coming out of a glove-shop with a rather over-dressed lady. From a distance she made sure the man was her husband, and without a word of warning she gave him three or four sound boxes on the ear. When the gentleman turned round to confront his assailant, she perceived that she had made a mistake, and at the same time she caught sight of her husband, who had replenished a cigar-case at a tobacconist's and was crossing the street. What could she do? She fainted in the arms of the stranger whose ears she had boxed—while the other lady ran off as fast as she could to avoid scandal. The stranger, who was a comedian, was astonished to find an unknown lady in his arms; and, while his ears were still tingling with the blows, he was again startled. A gentleman collared him, and shaking him roughly, asked him what he meant by embracing a lady in the street. "Why, she boxed my ears and fainted!" screamed the actor. "She is my wife," shouted the irate husband "and never would have struck you without cause." The infuriated gentlemen shook their fists until the lady, who had been carried into a shop, recovered sufficiently to explain how it happened.

At the recent Anthropological Congress at Jena, Prussia, Privy Councillor Schaafhausen read a paper on the color of complexion, eyes, and hair. He said that blue eyes indicate a lack of coloring matter which originally proceeded from inferior nourishment, and was evidence of a weaker organization than is possessed by persons of dark eyes. The less coloring matter there is the lighter the hue of the eye, until, by reason of its utter absence, the blood vessels become visible, and the eye is red, as is the case with the Albinos. The fact that people living in the country, other things being equal, have light colored eyes more frequently than those living in cities, is accounted for by the inferior nutritive value of the vegetable food of the former as compared with the meat and beer of the people of the cities. In the mingling of the blonde and dark types, the latter usually shows the greater vitality, and the children assume the darker complexion. The blonde complexion usually carries with it a finer organization and a higher and a thinner voice. Of sopranos and tenors, a majority have light-colored eyes and light complexions, while of most alto singers, and particularly of bassos, the reverse is true. The fact that light hair and eyes are more numerous in northern than in southern countries is attributed to the colder climate, which consumes the pigments of those features. Dr. Schaafhausen's conclusions were based on statistics carefully gathered.

LONDON.

LONDON is the greatest city the world ever saw. Babylon, Thebes, Rome were never so populous, while the largest city of India at the present time, contains less than a million inhabitants. Within the borders of the metropolitan and police districts, a circle of fifteen miles, it is computed there are at the present time upwards of four million persons. London is three times more populous than St. Petersburg, twice as populous as Constantinople, with two-thirds more people in it than Paris, and one-fourth more than even the living multitudes of Pekin. All Scotland but equals it in the number of its people, and half as many Yorkshiremen again as are numbered in their own county could find accommodation within its circle. Every eight minutes of every day of every year a soul goes out of London, and in every five minutes of every day a new immortal enters upon this scene of its probation. It is at once the court, the seat of government, the center of fashion, the home of all the charities, and the general rendezvous of all criminal and desperate characters of the United Kingdom.

PARROT-TOED.

C. H. E. R. asks why parrots always hold their food with their left foot. Well, now for a "scientific why." The parrot stands upon his right foot because it is right to do so, and as he has but one foot left, he is compelled to hold his food with his left foot. Q. E. D. Patent applied for.

BRIC-A-BRAC.

BY C. H. E. R.

THE following anecdote is told of Lord Brougham. "Mr. Brougham (afterwards Lord Brougham) was junior with Mr.—, a leading counsel of the day, in a *cause celebre* that nearly concerned the royal family. The leader, oppressed with the responsibity of his charge, and weary with his exertions, had been addressing the court in close argument for several hours, when it was apparent to every one that his mind had suddenly ceased to act in unison with his speech. Mr.—became hurried, stammered, and began to plunge. Brougham saw what had happened, and instantly rose, interrupted his chief, and addressed the court. Wearing upon his face an expression of great suffering, he assured their lordships of his deep regret at having to trouble them at such a time with a matter personal to himself. He did most unwillingly, but he was sure their lordships would forgive him if they only knew the agony he was enduring in his right ear by reason of the killing draught that rushed through "that door leading into the Common Pleas." He was nearly mad with earache. What he *should* do if the nuisance continued he could not tell. Might he, in the interest of his clients, entreat the interposition of the Bench? The Bench condoled with Brougham on his suffering, and at once ordered measures to be taken to stop the draught. "The door leading into the other court" was shut, but still the draught came; windows were examined, and sandbags were placed against the openings in them till the nuisance was abated—till a good quarter of an hour had been consumed, and Mr. Brougham's leader had had time to recover himself. It is, perhaps, needless to add that the intelligent junior "had not an ache or pain in all his great body."

So inscrutable may the human face become, that frequently it is but a mask which conceals the real character. The men and women most famous for heartless cruelty have often been celebrated for their handsome faces; writers of fiction have not been unmindful of the fact, and Faust is represented as being a handsome man; while the German fishermen sing of the sirens who drag men's souls down to perdition with their fatal dower of beauty. Some faces are unreadable, and tell nothing of the owner's character. The merriest men now and then have solemn faces, and the most serious frequently have cheerful ones. Frequently the most heartless coquette has all the shy graces of a girl of sixteen, while the heart of some woman who looks you through with cold, steady eyes, may be filled with love and tenderness that you are too blind to discover. So we all go on, wearing disguises of different devices, never quite concealing, never revealing, the life within. And thus it will ever be.

RICHARD COEUR-DE-LION once took the Bishop of Beauvais prisoner in battle. The Pope, hearing of it, sent to him to say that he had broken the privilege of holy church and taken his son. The king, in reply, sent him the armor in which the bishop was taken, with this, in writing, "Vide num hæc sit vestis filii tui" (See whether this be thy son's coat or no.)

A good reputation should be preserved with especial care, for when once lost, it is always difficult, and sometimes even impossible, to recover it. Good renown is like ice, which, when once broken, can never be made whole again. The following fable affords a very useful lesson on this subject. It happened one day that Fire, Water, and Reputation were traveling together: they were deliberating how they should meet again, in case of losing each other. Fire said, "You will find me, when you see smoke." Water said, "Where you see marshy places, you will find me." But Reputation said, "Take care you do not separate from me; should you do so, you run a great risk of never meeting me again; for when I am once lost, it is very seldom I am ever recovered."

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

LOVE.

A VOLUME in a word—
An ocean in a tear:
An old, a never-ending song,
That angels stoop to hear.

A seraph's perfumed kiss—
An Ætna of unrest:
A word, the royal king of words,
Writ on Jehovah's breast!

[*Transcript.*

LETTERS FROM A COUNTRY GIRL.

MARGARET B. HARVEY.

No. 1.

COUNTRY life has in it glorious possibilities of beauty, loveliness and happiness. Fragrant flowers, graceful trees, smiling skies, rippling brooks, and grand hills, are all around to feast the eyes; pure air, clear water, wide space, and fresh breezes contribute to the health; and the fields, the orchards, the streams, and the forests, are ready to give of their riches to the table.

But, alas! in how many localities do we find country life hard, cold, and contracted, especially among women! Unnoticed are the glorious sunsets, unheard the songs of the birds, unknown are all the attractions of art, literature and science—all such thoughts, inclinations, and opportunities are trodden out in the everlasting tread-mill of the work of a farm-house.

A farm-house! What more beautiful picture than the average one on a bright, spring day, as it stands back in its ample lawn, sheltered by tall trees and adorned by its vines and shrubbery? Perhaps, on near examination, the fence may prove a little dilapidated, the lawn weedy, the trees wormy, and the flowers coarse; nevertheless, it is a charming sight. And what more dismal picture than the inside of the same house on a rainy day, when there is no escape to the lawn or woods, and one is compelled to remain imprisoned within its bareness and gloom? Yes. Notably in the country, with boundless ungathered harvests lying all around, does the soul starve. There are immense barns for the crops, ample stables for the cattle, great cellars for the provisions—but for the hearts and the souls, are there *homes?*

In some places, yes; but in most, no. How different it all might be! The farmers are the princes of the soil, the kings of the earth; but this royalty, after all, is of an inferior, corporeal kind. Yet it might be and ought to be, in every respect, "a goodly heritage."

Take a farmer's wife. All around her, rolling on every side, are broad acres which, in name at least, belong to her. Great is her wealth in flocks and herds. Large is the amount of money she can think of as her own. Commodious is the house of which she is mistress. But the acres do not know the sound of her foottall; of the flocks and herds she cannot dispose of one head; of the money, a few pennies now and a few dollars then are all she can touch; of the large house, all is dreary, and the kitchen her constant abiding-place.

What can *she* do to elevate the members of her household, to say nothing of the country round? Hopeless indeed, seems her task. But there never was a worse that could not become better. To such a one I would say: first of all, you must be perfectly willing to try; second, keep up heart, even through years of effort and discouragement. With your small means, and amid the hard routine of your every-day work, how shall you begin? This is the hardest part of your task. But the best commencement is, to determine to make one.

Now and then you *do* get a little money from selling the produce of your own little garden-patch, or from eggs and chickens, perhaps; but once in a while, like a school-girl, you have a little. With your one end in view, this is to be laid sacredly aside for—books.

Yes, books. You always want them and must have them—there is no such thing as growth without them. We must have the choicest thoughts of the best minds to correct our mistakes, discover our needs, and receive our inspirations. It is not enough that you have a ponderous Bible, a Psalm-book and a gay Annual on your parlor-stand—books must be purchased just as continually and surely as clothing. Under ordinary circumstances, buy according to your own fancy; but now you have a purpose in view, so buy specifically. Purchase then, first "House and Home Papers," by Miss BEECHER and Mrs. STOWE; then you want "The Schoolmaster's Trunk," by Mrs. ABBY MORTON DIAZ; get a good Botany—Gray's or Mrs. Phelp's—and as soon as ever you can afford it, "Appleton's Cyclopædia." Now you are well armed for your attacks on ignorance, stagnation and discomfort.

Read carefully the first-mentioned book, and keep it by you as a reference. Many of its suggestions are of no use to you, but many others will be just what you want. Ah! now I see that you are awake. You realize how much there is for you to do, but you also realize that you can do more than you thought.

I have a fine house, you say—why not *use* it? Its rooms shall be all thrown open and thoroughly aired. There is plenty of wood, and the boys shall make fires all through to dry out the damp and mold. And I will keep fire always in the parlor and sitting-room as well as in the kitchen, and open the doors straight through, and keep up a constant summer heat—not have one room like an ice-house, the next like an oven. So the upstairs shall be kept warmed, and the children can use the center-room to dress in, and I will keep fire there. We *can* afford comfort at least, and this we will have, first of all.

Some of your family may talk of extravagance. But you can talk of chills and colds and cramps and catarrhs and medicines and doctor's bills, and continue to do so until they all like the new order of things too well to object any longer.

Next, survey your possessions. You will probably find yourself growing dissatisfied with your rooms. This is a good sign. The pictures and ornaments soon go to the garret, the gaudy shades disappear, the flaming papers come off, and everything you own takes a thorough overhauling.

The walls soon are covered with a plain, neat paper, or painted with some neutral tint. If the carpets are too gay, you resolve to replace them as soon as possible; but for the present, you will try to direct the attention from them; if too dull, you relieve them by bright rugs. You may do up the furniture yourself without the aid of any one, for a mere trifle. Make a mixture of linseed oil and amber and rub all the bare places, and when dry, apply a coat of varnish. When everything is bright and clean and full of light and warmth and sunshine, put clear, fresh muslin curtains to the windows, and let them fall in full, ample folds. You are now in a good way. It will not be long before flowers and vines are everywhere, choice engravings adorn the walls, tasteful ornaments appear on the mantels, and the select library grows. Of all this also, more anon.

And your house must be *used*. Take time—make time—to read, plan, and rest. At first, perhaps, the "men-folks" will not want to sit in the parlor or sitting-room, or they will go in with boots fresh from the barn-yard. But you can impress upon them that no one has a better right to enjoy a house than its owners, and coax them to wear the comfortable slippers you have provided, and they will soon appreciate it all as much as you do.

And now you have done wonders, though—as I shall presently show you—not half enough. You have laid the foundation of a refined home, and the superstructure will rise almost insensibly. New beauties will be continually added, as your taste develops and your love of home increases, and like rays from a focus, its influence will reach out as a continual inspiration.

HOME SKETCHES.

BY ALIQUA.

DOT is my daughter, four years old. I introduce her thus at first, because if I am to write from my home, and of it, you often will hear of her. The lady readers of the RURAL know how important a part of home life are the children.

Dot assists me in fancy work by her admiration and advice, and occasionally by tangling my zephyr or making free with my patterns. Whenever I find a really pretty pattern that I think may be of use, I put it away in a box for the purpose; and when I need a pattern I invariably find in my collection one that is just the thing. These patterns make excellent ornaments for doll-houses, and sometimes are confiscated for that purpose, but always are returned in good order. The other day I went to this box to find a pattern for a toilet cushion; and selected a bunch of leaves and sprays to be worked in satin-stitch. Over this I basted a square of Swiss muslin, through which the pattern was distinctly seen, and embroidered it with shaded green zephyr. I took single zephyr, but split it a needleful at a time. Care must be taken to leave the stitches sufficiently loose, as the Swiss will draw easily; also to use a medium-sized needle which can be done by waxing the end of the zephyr; a large needle will tear the muslin. For the border I used a two-inch pleating of the muslin, finished on the outer edge with button-hole stitch in green split zephyr, and headed the pleating with a narrow green ribbon laid on plainly and held in place by cross stitches of gold color. This cover placed over a white cushion is pretty and effective. I have made still more delicate ones by selecting patterns of flowers, and using shaded embroidery silks instead of zephyr. Charming Swiss tidies are made in exactly the same way only a trifle larger.

The autumn leaves that I had this winter, were mostly of soft maple, and most beautifully shaded and spotted. When trimming my rooms, I laid aside some of the smallest and brightest and varnished them with care, though they had been ironed with wax when gathered and afterward pressed. When dry, I arranged them in groups on back-grounds, some of white bristol-board and others of tinted pebble-board. Mucilage can be used to fasten them, but I used a fine needle and brown sewing-silk. I made for them rustic frames of walnut splints, oiled with linseed oil; if a higher finish is desired they can be afterward varnished.

Out of pebble-board I cut a letter-case of tasteful shape, pinked it around all the edges with a pinking-iron, and with a shoe-maker's punch made a hole in each scallop. This I ornamented with some of the smallest and brightest of the the autumn leaves, and being fastened with thread they can be replaced at any time without spoiling the foundation. Decalcomania or transfer pictures of leaves and flowers are very pretty for these letter-cases and similar articles of use and ornament, and do not need to be remedied.

Dot has stopped playing "blind-buff-man" with her dolls, to tease me to go and make "purple-cake," otherwise marble cake, which is her favorite.

KNOXVILLE, Tenn.

A PLEA FOR THE CHILDREN.

Another "Family Talk."

CLINTON.

YOUR correspondent, Mrs. POTIPHAR, in her article in RURAL of 9th February, deprecates the natural increase of our native population. She assumes that so large a proportion of the infants who are born into our world are doomed to "lives of toil and privations," that it has become a duty to "sacrifice numbers to superiority;" in other words, to raise fewer children, and better ones. Precisely how this improvement is to be effected, she does not inform us—whether by the "selection of the fittest," or otherwise, is left entirely to our own inference.

She does, however, promulgate a new "bill of rights," which, no doubt, has a bearing on the subject. While kindly admitting the right of a man and woman to marry, if they "love each other sufficiently," even though they are poor, she asks, "What right have they to bring little children into their world of deprivation?" "Parents who are physically, morally, or *financially* weak," (mark the latter disqualification), "have no right to children." Putting this and that together, it amounts to the positive declaration that *poor people* have no *right* to become parents. *Ergo*—*that* right belongs exclusively to the wealthy; and to clinch the matter, she asserts that a child has a *right* to be "well born." This right, then, inheres prior to birth.

Mrs. POTIPHAR (unfortunate selection of a name—if it was selected) appeals to Scriptural authority, to sustain her strange doctrine. Now let us examine the Scriptures briefly, and see what that authority teaches. We find in the very first chapter of Genesis, not merely a permission, but a direct *command* to the only representatives of the entire human family, to "Be fruitful and multiply and replenish the earth." Precisely the same command was subsequently given to NOAH and his three sons. We find the same command, virtually, repeated in numerous instances afterward. It was substantially incorporated with the Jewish law. No greater misfortune could befall a wife than to be childless. No greater blessing could she ask, than "to bea joyful mother of children." How natural was the regret expressed by that ancient Hebrew husband when he said, "Seeing I go childless!" How touching the appeal of that later Hebrew wife, when she cried out, in her grief at her childlessness, "Give me children, or else I die!"

The Saviour had a fondness for little children, and said "of such is the Kingdom of Heaven." He did not discriminate between the "well-born," and the "children of toil and of privations." Possibly the number might have included some who were as "ill-favored" and as "ignorant" as those of whom your correspondent now speaks so disdainfully.

Out upon such a theory as your correspondent advances! As a father and as a citizen I protest against it. Some of the best and greatest men that ever lived were the children of poverty, and, apparently, were born to lives of toil and of privations. But by noble energy they succeeded in overcoming the adverse circumstances, and gained for themselves honorable reputations, which became world-wide. In our own country, two, at least, of such, have occupied the highest seat in the gift of their countrymen. Let no one, therefore, be discouraged because he had not the good fortune to be *well-born*. But, "Did our Creator design that woman should spend her whole life in a nursery?" No, not her *whole* life, certainly. But if she be a true woman, acting on the right impulses of her womanly nature, she will not object to giving proper attention to that important portion of her duties—to care for and properly educate her infant offspring, both physically and mentally. She will find much pleasure in so doing. If she loves her offspring, if she rightly loves herself, if she loves her husband, if she loves her country, if she loves her God, she will not consider it a "sacrifice of all the grand possibilities of her life," but rather a pleasure, to devote a portion of her time even to the "petty details" of the "routine of cradle-tending."

ANSWERS TO CORRESPONDENTS.

"A READER OF THE RURAL."—Some few ladies have sent money sufficient to pay for two yards of muslin with orders to stamp an initial in the center of each yard, but most ladies have simply ordered the initial stamped on a piece of paper.

L. B. S.—White hats are suitable only for dress occasions. It would be in better taste for you to have a pearl gray felt.

LILLIE W.—West Indies.—Prepared chalk will whiten your skin quite as effectually as any of the much puffed powders, and there is no danger of its injuring your complexion.

MRS. H. L. JOHNSON.—Summer silks sell as low as 65 cents a yard, and for $1.35 one can buy an excellent quality of silk, American manufacture.

THE POLONAISE.—In reply to the many inquiries concerning prospects for the continuance of the popularity of the polonaise, I can assure the ladies that there is not the slightest possibility of this convenient form of garment going out of style. Several new models for it have been introduced, illustrations of which I will publish next week.

CORA.—Begin with Dickens' Child History of England. Get the facts well fixed in your memory and then you will be better prepared to attack a more elaborate history.

MISS NELLIE BOARDMAN.—Send on your silk; I will match it for you.

The Querist.

ANSWERS TO CORRESPONDENTS.

NOTICE.—Our questions have so accumulated that we give undue space to them this week, while apologizing that we have been unable to give them earlier publication.

Training Setters.

Gussie B., Bristol, Tenn.—Will the RURAL please inform me of (1) the best mode of training an English setter and at what age to commence; (2) also how deep potato onions ought to be planted?

ANS.—1. Commence when he is four months old. Be gentle but firm. Let his first lesson be in "down-charging." Place him in the proper position and repeat the words "down-charge" frequently so as to associate the sound and the act. Make the first lessons short. Never require of the pup any obedience that is not absolutely necessary. But invariably persevere in any lesson that you do attempt. It is of the first importance that the pup should be made to understand that you are master and that there is no escape from a compliance with your command. When house-broken in this manner, field-training, if he has a good nose and is of good parentage, will come very easy. You have but to teach him to come "to heel" and to "hie on," terms which explain themselves. Then he must "down-charge" whenever a bird is shot or shot at. For the rest, his instincts will guide him. Good dogs are *trained too much*. Bad dogs are worthless creatures.

2. Plant near the surface in drills about a foot apart and four inches apart in the rows.

About Clematis, Etc.

Mrs. R. B. asks:—(1) Ought Clematis seeds to be soaked in boiling water before planting? (2) What course ought to be pursued that would be most likely to produce double flowers from the seeds of the Ten Weeks Stock? (3) Is there a pure white Nasturtium? (4) If so, where can it be procured? Have purchased seeds purporting to be white, but they proved to be a pale yellow! (5) Of the large and showy varieties of the Dahlia will you please name a good white one, also one of the best crimson or scarlet ones. (6) It would please me much if the illustrations and articles on Clematis published in the RURAL five or six years ago could be reprinted.

ANS.—(1) It will do them no harm if placed in water *nearly* but not quite boiling. We do not know that it will hasten germination, never having tried the experiment with Clematis seeds. Often they will not germinate in two years. It is well to bury them or place in dampish sand as soon as picked until the following spring. (2) Mixing the single flowers with the double ones. This may be done artificially by placing the pollen of the one upon the stigma of the other, or by placing both sorts of plants near together. (3 and 4) We do not know of any. (5) Vesta, Snow-ball and Snow-drift, for white; Dr. BOYES, Flambeau (Pompone.) (6) We would be happy to comply with this request, but the article was long and our columns are much crowded at present. We can, however, promise notes upon the Clematis ere long.

Weeping Beech.

F. H. D.—In setting this tree in the lawn, how much space ought to be allowed, to produce the best effect?

ANS.—It grows very slowly for the first three or four years, but forms a tree twenty feet high with spreading branches, in ten years. It is one specially adapted in all respects to occupy an isolated position. We shall soon present a picture of this tree that will give our friend a better idea of its form than anything we can add to the above.

Grape Culture.

E. P. Orr, Tuscola Co., Mich.—Being a new subscriber to your interesting paper, I would like to ask a few questions regarding the culture of Grapes. (1.) What time of the year should Grapes be set out, and what kind of soil? (2.) What treatment do the young vines require the first year?

ANS.—(1) Spring or fall, the former preferred. The soil should be naturally of the best, or else enriched with bone, potash, and nitrogenous manures. Thoroughly decomposed stable manure is good.

(2) Clean culture, firm support, the pinching out of all but one, the strongest, shoot.

Gypsum and Plaster of Paris.

L. C. M.—What is the difference, if any, between Gypsum and Plaster of Paris; some of my neighbors say they are the same thing; others insist that they are not—will the RURAL please decide.

ANS.—Gypsum—otherwise sulphate of lime or land-plaster—is sometimes confounded with Plaster of Paris, even by those who should know better. Plaster of Paris, however, is made from ground Gypsum by heating it. This drives off all the water and reduces it from a granular condition to that of an impalpable powder. Gypsum is the most suitable name for the agricultural article, for it is not in condition to be used as plaster, and no confusion can occur by the use of the word.

Miscellaneous.

J. B., Fontana, Pa.—Will the RURAL please inform me where I can get eggs of the pure-blood Dominique stock, also a pair of the fowls?

ANS.—Address GEO. S. JOSSELYN, Fredonia, N. Y. HENRY HALES, Ridgewood, N. J.

B. S. Ward, Salem, Oregon.—In RURAL of October 27, 1877, I notice a correspondent writes very highly of the Hornet Raspberry. What I wish to know is if there is a probability of its being what it is there represented and where it can be obtained. Will the RURAL please give me the full address of some one that has them?

ANS.—The above publication of your letter will probably gain you the information you seek. Its hardiness in your climate is the one thing you have to consider.

H. D., N. Y.—Would the RURAL please tell me through its columns of advice (1) about how much grass land is worth an acre in New Jersey, within fifteen miles of Newark; (2) if you consider that locality very healthy. Also, I would like to have T. B. MINER say what the chances would be for a young man with a small capital, say about $3,000, who would start a chicken farm, without any practical experience, but who has studied French books and American papers on that subject. Any information on the above will be very thankfully received.

ANS.—(1) It is impossible to answer this question with any degree of accuracy. The best answer we can give is to say $200. (2) There are localities within fifteen miles of Newark, in New Jersey, as healthy as can be found within fifteen miles of New York City or Boston or Philadelphia.

J. L. Bill.—Will the RURAL please inform me (1) whether coal ashes will pay to put in the barn yard to help make manure; (2) Can ripe grapes be put up in any way to keep them any length of time fresh and good; (3) What shall I do to a plum tree to make it bear fruit; it blossoms but they all fall off.

ANS.—(1) The fertilizing properties of coal ashes are very trifling, if at all existent; but the ashes are often useful as an absorbent, while their mechanical effect in lightening heavy soil is also beneficial. If the manure is to be applied to soil of this description, mixing coal ashes with it will pay, otherwise, scarcely. (2) The roots can be wrapped in moss and occasionally moistened. (3) Cut it back now and enrich the ground about it.

Jasper.—(1) I believe, according to the RURAL'S announcement, I am entitled to five papers of flowers. (2) Please tell me when seeds of the Polargonium should be planted to insure success.

ANS.—(1) The free seed distribution was discontinued last year by limitation. Another will be announced during the present year of which we hope our correspondent may avail herself. (2) If in the house, plant now; if out of doors, not until the middle of May.

Mrs. L. G., Mt. Vernon, N. Y.—Many thanks for the seeds you so kindly sent. Will you please tell me through the columns of the RURAL if an Ageratum and a Eupatorium, are the same.

ANS.—They both belong to the same great family but are different genera. Eupatorium perfoliatum is the well-known Thoroughwort or Boneset. E. ageratoides is White Snake-root—both native plants. The Agoratums are from tropical countries.

Mrs. S. C. T., Perry, N. Y.—A short time since I received a variety of flower seeds from the RURAL office for which accept my most sincere thanks: I shall try and take the very best care of them. Among them was one of the Glaucium luteum. I have searched the old RURALS and Vick's catalogue but cannot find a description of the plant; you will confer a great favor upon me by giving me the name of it in English, also whether it is a house or out-door plant.

ANS.—Glaucium is derived from a Greek word signifying "sea-green" referring to the color of its leaves. Luteum is Latin for yellow. It is a hardy perrenial and is very desirable for flower-beds, the lawn or for edgings. It is not offered for sale except by a few seedsmen among their novelties.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING MONDAY, FEB. 18TH.

News of the Week.

CONDENSED NEW YORK TELEGRAMS.

TUESDAY, Feb. 12.—Intense excitement and wrath among the "visiting statesmen" at the fate of the Louisiana Returning Board. They declare Anderson's conviction the result of a packed jury, a drunken judge and a lawless mob.

The situation in Europe is highly critical: Russia threatens to occupy Constantinople if the fleets of England or any other nation approach the city. England is resolved to send her fleet thither, and intimates that she will consider Russia's occupation of the Turkish capital a *causus belli*. All talk about the projected conference seems to have dropped in view of the imminent peril of immediate hostilities. Turkey seems to have suddenly conceived a great affection for and confidence in the Muscovites. It seems conceded on all sides that Bismarck holds the key of the position. What use will he make of it?

WEDNESDAY, Feb. 13.—The President has written a letter to the Attorney-General, asking what the Administration can properly do to save the La. Returning Board. He and his Cabinet think the prosecution the result of partizan rancor and the conviction the consequence of a packed jury and a corrupt and hostile judge. The proposed reduction of the whisky tax has been defeated. That Conkling and Spencer, and Spencer and Conkling have different influence was shown yesterday by the confirmation of Wickersham to be postmaster of Mobile, despite the opposition of Spencer and Conkling, whereas those whose confirmation was opposed by the other union were defeated.

The excitement in regard to the menacing attitude of the British Government towards Russia, is intense. Lord Derby says he hopes by Tuesday to be able to inform Parliament that the fleet is before Constantinople. Prince Gortschakoff has snubbed the English Ministry by answering their enquiry about the proximity of the Russians to Constantinople in court terms, that the conditions of the armistice concerns the belligerents alone. The Grand Duke has informed the Porte that his troops will enter the city so soon as the British fleet appears in the Bosphorus.

THURSDAY, Feb. 14.—Violent recriminations between Democrats yesterday in the House with regard to the charges of dishonest bargains in the Electoral matter.

The British fleet has passed the Dardanelles into the Sea of Marmora, and will go to Constantinople at all hazards. Torpedoes have been shipped from Odessa for Russian use in the Bosphorus. At all the English dock yards, work is being pushed forward by day and night. At present there is a dark outlook, but as the war, if once begun between Great Britain and Russia, would most likely involve the whole of Europe before long, doubtless every expedient will be tried for averting so disastrous a struggle.

FRIDAY, Feb. 15.—Mr. Tilden is credibly reported to be the prime mover in the trials of the Louisiana Returning Board, with a view to his re-nomination at the next Presidential election. Very severe weather on the ocean reported by vessels that have just come into port. Many of the passengers that escaped from the wreck of the Metropolis, set sail again yesterday for Brazil on board the Richmond.

The Russians have renewed their march on Gallipoli, and are within a few hours' march of the place. The English Ministry have decided to ignore Turkey's protest against the advance of the British fleet. A large number of Whitehead torpedoes have been shipped to the East. Gladstone and most of the Liberals violently oppose the warlike movements of the Government. Austria is indignant at Russia's disregard of her representations, and will probably join England in hostile movements unless the Czar soothes the Emperor by conceding at least a part of what is asked for. It is said that that Roumania also, rather than yield to the Russian demand for the retrocession of Bessarbia, may join the coalition, and endanger the Muscovite communications.

SATURDAY, Feb. 16.—According to her last wish, the body of Mrs. Jane Pitman of Cincinnati was yesterday cremated at Washington, Pa., by Dr. Lemoyne. Reports of local embezzlements, bankruptcies and swindles compose nearly all our domestic telegrams.

Four British iron-clads have reached Princes' Island, four miles from Constantinople, two remain at Gallipoli, and three at Besika Bay. To prevent the Turks from firing on them, Admiral Hornby had to declare that the fleet came to protect Turkish as well as British interests. Come what may, the Sultan will remain in Constantinople. The Turks are still fortifying the redoubts around the city. Russia has assured Austria that she will occupy Bulgaria for only two years. It is said British prevarication has so disgusted the Turks, who based all their hopes and conduct on English untrustworthy assurances of aid, that henceforth they will seek a close alliance with Russia, however disastrous it may be to British interests.

SUNDAY, Feb. 17.—After an all-night session of the Senate on Friday night, the Silver Bill was passed early on Saturday morning by a vote of 48 to 21. Four absent members, two of whom would have voted affirmatively and two negatively, were paired; and RANSOM of N. C., who would have voted for it, was absent through sickness without pairing. As more than two-thirds of the Senate are in favor of it, there is but little doubt but it will become a law, even if the President vetoes it.

The outlook in Europe is more peaceful. The English fleet has been withdrawn to Mudania Bay, forty miles south of Constantinople to facilitate negotiations to prevent the entry of the Russians; orders have been sent to the Muscovite headquarters not to occupy Gallipoli. A Congress—not a Conference—has been agreed upon, to meet within three weeks at Baden-Baden. All the Powers have consented; and it is expected peace will be signed by that time. The Grand Duke Nicholas will visit Constantinople as the friend and invited guest of the Sultan. The Greeks seem resolved to risk a whipping, and are again preparing for hostilities. When the conclave assembles, it is expected a new Pope will be elected in a few days.

MONDAY, Feb. 18.—The President is reported to think that his veto will kill the Silver Bill, whereas its friends are confident the late vote of the Senate guarantees its success despite the veto.

Russia has represented to England that the United States, as a maritime power, should take part in the approaching Congress. England has consented, but said Greece also should be admitted. The latter country will be an ally of England in case of war. The Czar has intimated to the Porte that it should remove the Mussulman population from Bulgaria. Bismarck's representations have modified the demands of Russia, and are said to have renewed the good understanding between Russia and Austria, so that the latter will not be an ally of England, should she venture to break with Russia. The English fleet will remain at their present post during the Congress, and the Russians have agreed not to enter Constantinople. The ultramontane cardinals are making vigorous efforts to elect a Pope of their own party. Many false reports of disputes, etc., etc., in this connection, are sure to be spread until the conclave has finished its labors by nominating a new Pope.

HOME NEWS PARAGRAPHS.

SOME of our readers may feel too lazy to "go forth" and obtain two new subscribers, which would entitle them to the Cricket as a present. If, however, a single subscriber should fall in their way, they may add one dollar and secure the RURAL CRICKET, which, could they not procure another, they would not part with for five dollars!

Two hundred different varieties of a fruit regrown successfully in Georgia.

On New Year's day, new potatoes sold in San Francisco at ten cents a pound, $6 a bushel.

During the past year not a single mile of railroad was built in Georgia, Mississippi or Arkansas.

Nineteen thousand sheep from one county in Texas, alone, are being grazed on the North Platte.

From 1867 to 1877 the total tax paid on manufactured chewing tobacco amounted to $213,216,327.15.

It cost the Government $5,187 to run the revenue office at Frenchman's Bay, Me., last year, and the receipts were $8.85.

Sixty millions in U. S. Government bonds have been returned from England and Germany within three months as the result of the silver agitation.

They have "mush socials" in Cleveland, and vast quantities of boiled mush, cold mush, fried mush, mush patties, mush omelet, mush pudding, &c., are disposed of.

The large number of negroes who have rented land in Alabama and gone to farming for themselves, has caused a great scarcity of hands among landowners who desire to farm their own land.

The overseer of the poor at Geddes, N. Y., erected a building worth $400 for tramps to lodge in free of cost. On the third night they beat their benefactor almost to death, and burned the house.

The number of Mormons in Scandinavia is stated to be 2,249 in Denmark, 1,606 in Sweden, 892 in Norway, and 15 in Iceland. During the course of last year, 583 persons emigrated from Scandinavia to Utah.

The southern education convention, in session at Atlanta, Georgia, has adopted a resolution favoring the creation of a national education fund from the proceeds of the sales of wild lands, and will memorialize Congress.

Indiana farmers say that either the dogs must be killed off, or they will stop raising sheep. So much mischief has been done to flocks of fine sheep by worthless curs recently, that the raisers are completely discouraged.

In opening a bed of marl at Tarboro,' N. C., recently a stream was found about eight feet below the surface, in which was an Indian canoe containing the skeleton of a man, with the remnant of a paddle in the hand.

An owl shot near Burlington, Vt., had a steel trap and two feet of chain belonging to a Hinsdale, (N. H.) man, on its leg. The trap was set five weeks before in the Hinsdale man's henhouse, and was carried about 100 miles by its captive.

The total imports of barley from the Province of Ontario into the United States in 1877 were 6,825,082 bushels as against 7,521,382 bushels in 1876. The imports at Oswego from Canada in 1877 were 8,812, 154 bushels, an increase over the previous year.

A Sacramento woman accused her husband of attempting to kill her, and he was sentenced to prison for two years. Then she begged to be sentenced for the same term, because she could not bear to be parted from him, and the Judge refusing, she went away and tried to hang herself.

FOREIGN NOTES.

The RURAL Cricket Clock is a perfect little gem. It may be carried about in one's o'coat pocket.

Fifty per cent. of the marriages celebrated last year in Italy, were between people neither of whom could write their names.

The Russian journals are beginning to talk of "Czargrad," meaning thereby the city which the rest of the world know as Constantinople.

Besika Bay, where the British Mediterrancan fleet has so long been stationed, is off the west coast of the plains of ancient Troy, in Asia Minor.

In France ninety-five per cent. of the murders are committed for money; in Spain ninety-eight of every hundred murders are inspired by motives of jealousy or love.

Kangaroo hides are an important article of export from Australia. They make the most pliable leather that is known, admirably fitted for boot-legs, gloves and riding-whips.

The slave trade is extensively prosecuted on the Nile. A gentleman returning from Upper Egypt counted twenty-three boats between Asiout and Cairo laden with slaves, the men being tied together on deck, and the women in the cabins.

Manufacturers of Clothing and ladies' suits find the New Davis Sewing Machine adapted to the full range of their work, trimming, binding, sewing thick and thin goods, over-seams, without any difficulty, and requiring no basting or change of tension. The DAVIS SEWING MACHINE Co. are enlarging their manufactory at Watertown, N. Y., to enable them to supply the increasing demand for their machines.

Reliable help for weak and nervous sufferers. Chronic, painful and prostrating diseases cured without medicine. Pulvermacher's Electric Belts the grand desideratum. Avoid imitations. Book and Journal, with particulars, mailed free. Address PULVERMACHER GALVANIC Co., Cincinnati, Ohio.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 16, 1878.

BEANS AND PEAS.—Receipts of beans past week, 9,140 bbls.; Exports, 911bbls. Medium beans have been quoted stronger, and for strictly choice $1.90 has been obtained; the general selling figure for prime is unchanged. Marrows are weak, with poorer prices in Havana, their principal outlet. Good stock quoted $2, though all holders are not offering at that figure. White kidneys are dull, and have dropped to marrow figures. It is getting late for ready sales of Red kidney, and $2.50 is extreme. Black beans nominal. Green peas are dull and offered lower to arrive, at $1.17½@1.25. Southern B. E. peas, $3.25 per two bushel bag. Canadian field peas quiet at 83c. for general stock.

We quote:—Beans, medium choice, $1.75@1.75; other, $1.55@1.65; marrows, choice, $2.00@2.00; other, $1.85@2.00; pea, $1.80@1.85. White kidney, choice, $1.85@2.00; other, $1.85@1.95; red, choice, $2.50@2.50; other, $2.35@2.40. Turtle soup beans, $1.60. Lima, $8.

BEESWAX.—There is a slow market and prices unsettled; Western and Southern quoted at 26½@28c.

Exports for week, 1, 10,000 lbs.

BROOM CORN.—The trade is very light and prices unsettled.

Green brush at 6@7c.; green hurl, 6@7½c.; medium green, 5@6½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—The improved prices for fine and good table grades are firmly set and fairly responded to. The supplies of State are of more satisfactory grade with better receipts; at this season of the year the special reserve of the interior is usually released, but very little of the fancy is country-owned this winter. More Welsh could be used for the market and eastern trade. Best dairies are quoted 28@30c. but the price is exceptional. Stock good enough to bring the extreme can be very profitably broken up in the present scarcity of fine and strong prices. Still the rating helps next grade Western creamery and fresh factory steady and firm, with only moderate lots of either arriving. Roll butter is less abundant and outside rates are more frequently given. The movement in low grades during the past fortnight has taken out considerable stock, but holders are very willing that more should go at old figures.

We quote State creamery, 25@35c.; fancy pails, 30@32c.; other 25@28c.; creamery, good to choice, 25@35c.; half tubs, fine, 28 30c.; extra, 33@37c.; other, 22@27c.; Fall Welsh 27@28c.; Welsh tubs, dairy, 25@27c.; other, 20 23c.; full dairies, fine, 28@30c.; common, 20@24c.; firkins, 20@27c.; poor State, 14@21c.; Western creamery, good to choice, 40@12c.; poor to good, 25@32c.; factory, choice, 20@21c.; good, 16 18c.; common, 7@11c.; rolls, 12@18c.; grease, 6¾@7c.

Receipts for the week, 15,435 pkgs.

Exports past week, 1,874 pkgs.

CHEESE.—There is no marked change in the situation of the market. Demand for export is steady and fair, and the choice lots are being steadily reduced in stock.

Fancy factories, 13¼ 13¾c.; good and prime, 13@14c.; fair lots, 12¾@12¾c.; poor, 10@10¾c.; 7@10c., skimmed. Farm dairy, 12@13c. for good to prime; 10½@11½c. for fair lots; 7@10c. for skimmed; Western factory, cheddar, 13@13¾c. for fine 11@12c. for good; 5@9c. for poor.

Exports for the week, 22,056 boxes.

Liverpool cable, 69s. Gold closes 102¼.

COTTON.—The market has fluctuated sharply as the news from abroad varied in its character, but on the whole, is decidedly lower.

Latest prices are for February, 10.68@10.69c.; March, 10.61@10.63c.; April, 10.79c.; May, 10.92c.; June, 11.05c.; July, 10.21@10.13c.; August, 10.17@10.18c.; September, 10.02@10.03c.; October, 10.75@10.77c.; November, 10.78@10.79c.; December, 10.71@10.72c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*

Stained.

Good ordinary, 8¾c.; Strict ordinary, 8¾c.; Low middling, 9¾c.; Middling, 10c.

DRIED FRUITS.—Apples have a fair home trade demand, and the better grades are at strong prices. Peaches are dull and unchanged. Small fruits are in light supply and firm.

Apples—State quarters, old, 5¾@6¾c.; new, 5¾@6¾c.; Western quarters, old, 6@6½c.; new, 5¾@6½c.; Southern, new, prime sliced, 7c.; fair to good, 5@5¾c. Peaches—Peeled, new, 9@10c.; unpeeled halves, 4½ 5c.; unpeeled quarters, 4@4c. Pitted cherries, 16@17c. Blackberries, 9@10c. Raspberries, 27c. Plums, 16c. and Southern at 10c.

EGGS.—Receipts for the week, 11,160 barrels; do. last week, 6,062 do. The market has ruled weak, and no one seems prepared to say that the declining movement of the past week has subsided. State stock has been a great detriment to the market this year, and unless it is rendered less pressing before Lent—which begins March 6—even that special period in egg commerce may be severely damaged.

Near jobbing, 17@17c.; State and Pennsylvania, in good order, 16@17c.; Western best, 16c.; do. Southern, 15½@16c.; inferior and off quality, 10@14c.; State and Canadian, limed, 10@12c.; Western, 9@11c.

FEATHERS.—Live white prime Western geese, 45@47c.; mixed, 30@40c.

FEED.—Is more freely offered and easier. Sales 40 pounds ave. $17.50@18.00; 60 pounds ave. $17.00@18; 80 pounds ave., $18@18; 100 pounds, $19.00@20; and rye at $18.50@20.

FLOUR.—The news from the other side has started a large business, including export speculation and trade purchases and prices are higher and strong.

Latest prices are $4.15@4.75 for poor to fancy superfine State; $5.00@5.25 for common to fair extra do; $5.45@5.75 for good to choice do.; $4.15@4.75 for superfine Michigan, Indiana, Iowa, &c., outside for choice; $4.85@5.25 for shipping extra do., the inside price for poor, and $5.45@5.75 for good to strictly fancy extra do.; common to choice white wheat extras, $5.50@6.75; fancy do at $7.25@8.25; red and amber winter wheat, good to choice family, at $5.20@6.75; round hoop Ohio at $5.10@5.50, and trade brands of do. at $5.75@7.00, the latter for choice; St. Louis, $5.50@6.25 for poor to fair extra and $6.25@7.50 for good to fancy, (with a few brands of very fancy quality quoted up to $8.00@8.25); Minnesota clear, $5.10@6.25; Minnesota "straight," common to fancy, at $5.75@6.75, and patent poor to very choice, $6.75@9.00, with a few fancy at $9.25@9.75; unsound stock at $2.35@5.75; city mill extra at $6 10@6.35 for fair to very choice for West Indies; do. for England $5.15@5.20; do. trade and family extras, $6.50@7.50; do. South America, $6.40@7.50; No. 2 at $2.75@3.75.

Buckwheat Flour—Quoted at $2@2.60. Corn meal is selling at $2.50@2.90 for Western yellow and $3.20@3.25 for Brandywine.

FRESH FRUITS.—Exports of apples past week, 320 bbls. Very few lines of apples remain in store, and railroad arrivals are selling more freely. Baldwins and Greenings, $5@5.50; "Seeks" and Spitzenbergh, most of the latter now light-colored, $6@6.50; poor to fair remnants, $2.50@4.50. Russets will probably open regularly next week. We hear of prime Roxbury at $5. Cranberries have advanced; fancy bls., $8.50; good, $7.50; do. crate, choice, $2.50@2.75; good, $2.12@2.12; fair, $1@1.75. Grapes are out of market. Florida oranges, $3.50@5 ₱ case; extras, $5.50@6; there is a rumor that the crop will be short. The decline in peanuts fails to bring out buyers. Best hand-picked Virginia, $1.35@1.45; good to fancy, $1@1.35. Hickory nuts, 75c.@$1.

FURS AND SKINS.—Some of our surplus raw stock has been forwarded to London for the March sales more as a chance to realize, than for any real want abroad.

	No. 1 quality. Nor. & East.	West & N. W.

Wulf, mountain		1 50@2 00
prairie		50@ 60

GRAIN.—The markets have been very much excited by the European news and with large transactions prices are decidedly higher.

Latest sales are of No. 2 red at $1 28@— ungraded red and amber State, $1 10@1 40; white, $1 41; No 1 Northwest spring, $1 31; No. 3 Chicago, $1 20½; No. 2 red for January at $1 28½; No. 2 Milwaukee spring, $1 30. Rye is a trifle steadier; sales of Western at 71@73c.; State at 74@77c. Barley, 86c for No. 1 Canada; 86@86c. for six-rowed State. Corn is weak and quiet. Latest sales are of New York No. 2 at 60½@61c.; steamer mixed, February, 56@56½c. Oats of New York extra white, at 34½@38c.; do. No. 1, February, 35½c.; No. 2 white, 36@36½c.; mixed Western, 36@37½c.; white Western, 37@39½c.

HAY AND STRAW.—There is a good trade in medium grades and a fair shipping demand, with prices steadily held.

Bale hay, 65@70c. for shipping, and 70@85c. for retail qualities; clover, 40@50c. for prime. Straw, 50@60c. for long rye; 50@55c. for short rye, and 40@45c. for oat.

Exports since Jan. 1, 6,800 bales; same time last year, 7,600 do.

HIGHWINES are higher—$1.08½ regular.

HONEY.—Continues dull. White clover, 2-comb boxes, has sold at 13@14c.; dark and buckwheat at 8@10c. Selected white clover is in few hands, and might bring 18c.

HOPS.—The receipts continue liberal, and there are free sellers at late prices, leading to a great export business.

State choice to fancy, 11@13c.; good to prime, 8@10c; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Californians, 12@14c.

LEATHER.—Hemlock sole, 20@22c. for light, 21@22½c. for middle, 21@22½c. for heavy, 19@20½c. for good damaged.

MAPLE SUGAR.—Ohio new or re-molded, 14@16c. Some of the late arrivals are bright and handsome. Very little inquiry.

OIL-CAKE.—Western is quoted at $30@31 ₱ ton.

POULTRY AND GAME.—Steady supplies of dressed and easier figures cause low rates for the liberal supply of coops.

N. J. chickens, 7@9c.; W. fowls, 8@10c.; Turkeys, 6@10c.; Toms, 6@8c.; Ducks, N. J., pair, 87@$1.12; Geese, N. J., $1.75@2.00; Western, $1.00@1.25.

Receipts of dressed are not over heavy but there is no sharp demand, retailers not expecting more than too busy days at the close of the week, and by Friday there is apt to be an accumulation that keeps prices tame. Turkeys are unsaleable when exceeding a dozen pounds. Ducks are scarce and very firm.

Fancy Phila. and N. J. turkeys, 13@14c.; good, 11@13c.; large or Toms, 7@9c.; chickens, choice, 14c.; good, 11@13c.; common, 7@9c.; ducks, choice, 16@—c.; other, 13@14c.; geese, fancy, 11c.; other, 7@9c. Capons large 18@20c. small and slips, 15@16c.

Supplies are moderate in fancy game and prices are firm. Grouse are unusually scarce. Pigeons are in large supply but their comparative cheapness gives them activity.

Hares and rabbits, pair, 35@40c. Canvas-back ducks, $1.25@1.50; Red-heads, 75c.; Mallard, 40@50c.; Teal, 30@40c.; Quail, prime, $2.75@3.87; soft, $2.25@2.50. Partridges, pair, 75c.@$85c. Grouse, $1.00@1.45; poor, 90c.@$1.10.

PROVISIONS.—Hog products have tended a little stronger with a good export demand and smaller receipts. Mess pork, $11.14½@11.12½ for spot lots; $11.50 for April and May. Bacon at 5¾@5¾c. for long clear and 6c. for short clear. Lard—Western steam at 65c. for spot, 7.75c. for March, and 7.85c. for April. Tallow at 7¾c. for prime. Stearine, 8c. for prime Western. Beef hams at $16.50. Beef—New extra mess, $12.50@13.00; plain, $11.00@12.00; new packet, $14.75; family mess, $17.50; extra India mess, $28 for city brands; do. Philadelphia, $26.00.

SALT.—Ashton's at $2.50; Higgins', $2.40 and other sack lots at 95c.@$1.15; Liverpool ground, 65@70c.

SEED.—Clover, 7½@7¾c. for Western; 7¾@7¾c. for State. Timothy, $1.37½@1.42½. Rough flax, $1.55.

TOBACCO.—Export demand has been very fair and home demand small, but prices held as before.

VEGETABLES.—Exports of potatoes past week, 1,925 bbls.; onions, 132 do. Potatoes for local use are freely offered at $1.87 as extreme. Some seed orders are here, but special selection and packing runs the price up to $2.50. Bermuda produce arrive regularly. Full crop potatoes, $4.50@$5. Tomatoes, $1 6-quart box—slow. Other stuff low for the season.

We quote Peach Blows $1.75@1.87, bulk and double-heads. Early Rose, $1.75@1.87; Peerless, $1.25@1.50; Nova Scotia, $1.95@2.00; Sweet, $2.25@2.50. Cabbages, 100, $3.00@4.00; red, 5@6. Marrow squash, bbl., $1.50@2; Hubbard do., $2.00@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 62@75c. Red and yellow onions, $1.25@1.50; white, $1.25@1.75. Celery, doz., 75c.@$1. Hot-house mushrooms, ₱ lb., 20@40c. Radishes, 100 bunches, $4@4.50. Lettuce, small, dozen, 75c.; large, $1.50@$2. Cucumbers, doz., $3@3. Rhubarb, doz., $1. Spinach, Southern, $1 12@2 bbl.

WOOL.—There is no improvement to demand. Trade is in small lots, but prices are held steadily on other than fine fleeces; the latter being in fair supply can be had easier.

Ohio, Pennsylvania and Virginia—XXX and picklock, 47@50c.; XX, 45@47c.; X, 42@44c; No. 1, 43@46c.; No. 2, 38@40c.; common, 33@37c.; combing, 50@55c.

New York, Michigan, Indiana and Wisconsin—XX, 39@43c.; X, 35@42c.; No. 1, 40@41c.; No. 2, 35@38; common, 31@36c.; combing, 50@52c.

Iowa, Vermont and Illinois—X and XX, 36@39c.; No. 1, 37@42c.; No. 2, 33c.; combing, 48@52c.

Missouri, Kentucky and Tennessee—36@41c. for washed; 27@32c. for unwashed, and 38@38c. for unwashed combing.

LIVE STOCK MARKETS.

NEW YORK, Feb. 18, 1878.

BEEVES.—Receipts for the week, 10,076 head; do., last week, 9,037 do. The bulk of the supply arrived early in the week, and as large buyers were pretty well filled by Friday, the closing sales lacked spirit, and when stock was at all "off" in quality, easy rates were accepted. This was most particularly apparent at Jersey City pens. At Sixtieth street but few sellers managed to avoid a decline. The selling range is 7¾@10¼c.; one fair extra for 11c.

COWS AND CALVES.—There is no variation which encourages shipments of fine stock. Common grades depend upon choice sales. As nominal quotations, $60@60 rate the style of milkers now arriving.

VEAL CALVES.—Choice fat milk-fed are scarce and bring 9c.; Good New Jersey and prime State, 7¾@8¾c; other, 6@7c. Hog-dressed calves, fair to prime, 9¾@11c.; best grades selling quickest; grassers, 4@5c. Live grassers, 3@3¾c.

SHEEP AND LAMBS.—Receipts for the week, 18,485 head; do., last week, 20,639 do. Demand fair. Ohio showed some fine heavies. Quotations for sheep, $4.80@6.75 ₱ 100 lbs. Lambs alone, 7¾c.

SWINE.—Receipts for the week, 31,112 head; do. last week, 34,322. The last sale of live stock was Ohio, 160 lbs., at $4.65 ₱ 100; other sales, $4.50. Country-dressed pork arrives lightly; heavy to medium State and New Jersey, 4¾@5c.; Western dressed, 4¾@5¾c.; city, 5¾@5¾c.

DRY, HARSH, UNMANAGEABLE Hair, is rendered soft and glossy by Dr. Jayne's Hair Tonic. It stimulates the scalp, promotes the growth of the hair, and prevents it falling out. It is also a capital dressing for the hair, and cleanses it from dandruff.

Reading for the Young.

BABY.

One little head of yellow hair;
Two little cheeks, so round and fair;
Two little lips, with fragrant sighs;
One little nose, and two blue eyes;
Two little hands, so soft as a peach;
Two little feet, with five toes each;
Two little smiles, and two little tears;
Two little legs, and two little ears;
Two little elbows, two little knees;
One little grunt, and one little sneeze;
One little heart; no little sins;
Plenty of skirts, and lots of pins;
One little cloak, and plenty of frocks;
One little hood, and two little socks:
A big disposition to haul and to pull;
One little stomach, never full;
One little mouth, of the rose's tint;
One little bottle of peppermint;
Plenty to eat and lots to wear,
And yet this baby 's cross as a bear.

Chicago Times.

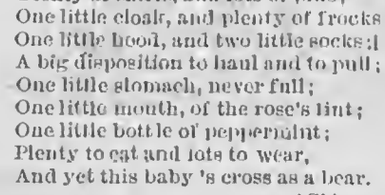
FAITH AND WORKS.

I am reminded of an anecdote, by a neat little parcel received from the Editor this morning. It is this:—When American watches were first introduced into China, the natives were struck with the adaptability of their cases for other and totally different uses; so, instead of devoting them to the uses for which they were designed, they removed the works, and installed little Joss images (their gods) in their places, being a funny instance of faith without works.

In the present instance the Celestial would be sadly balked, as the Rural "Cricket" sent me, is a little gem of a timepiece whose works cannot be tampered with; and in fact, the "Cricket" is so handsome, that even a heathen would have no desire to "improve" upon it.

My friend, the Editor, tells me that the Publishers of the Rural are offering this timepiece as a premium, and wishes me to tell my young readers my candid opinion of the Clock. I have no opinion. I can only say, "How can they afford to do it?"

Let us see what it is. This cut will give you a fair idea of the Aldermanic little fellow as he



stands on his pudgy legs, looking at me with the most open and innocent face you can imagine. The second-hand clicks away, cutting time into the crispest seconds; while the pure-white dial, with its clean, legible numerals, can be plainly seen from the remotest corner of the room.

A natural curiosity tempts me to look at the other side, and turning the "cricket" on its face we see that unlike other clocks we have here a

stem-winder, and a little knob by which the hands are moved at will; arrows engraved on the metal back point the direction in which the knobs are to be turned. The semi-circular opening with the figures F. S. at either end is the regulator, and just above it is a convenient attachment by which the "cricket" may be suspended against the wall. But how is this! While I have been telling about this entirely novel feature the clock has remained face down, but has kept ticking right on as relentless as time. This leads me to investigate. I turn it over on one side. It does not stop. I roll it along my table until it is only prevented from making a complete circuit by one of its legs. Useless effort! it ticks on unconscious of any change of position. Then I fall to experimenting in a way that may be termed grotesque, placing the "cricket" in the most absurd postures in the hope of gaining a victory and stopping the clock. My labor is wasted. I can, therefore, honestly subscribe to the claim of the publishers, viz.: it will run in any conceivable position.

I suppose it may be called a commendable curiosity to like to see the inside of things, the mystery so to speak. At any rate I felt a longing to see what this "cricket" was made of. But how to do it? It is said to be dust-proof, and curiosity-proof might have been safely added. After some little thought, and a great amount of tinkering I made this discovery: that the works are securely fastened to the back and front of the clock, making it impossible for them to get out of position; that the beautiful nickle-plated case is stamped out of *one piece* of metal, thus avoiding seams, and making it about indestructible. The glass plate fits over the face like a lid to a jar, and when all is in shape I think one has about the neatest, most charming little timepiece ever made. Being a *lever* movement it will run in any position in which a watch will run, and every inch of the works and case is metal. Its diameter across the face, is three inches and across the back, four and a quarter inches, making it eighteen inches in circumference. The illustration on another page gives a fair idea of its actual size.

It makes no difference how many clocks there are in a house, all who see this one will want it, and I advise you, my young relatives, to get one. The offer of the publishers is more than liberal and I should hold your powers of persuasion in low esteem indeed, if with such a lever as this clock, you could not carry your friends by storm. Now let me see what you can do!

Secure one clock to start with, and then make a crusade among your friends. If they can only see the "Cricket" they will be speedily captivated, and as for the Rural, you know what *that* is.

I have secured permission from the publishers to have all the Rural Cousins address what subscriptions they may secure to me personally. All who intend to add to the ranks of our cousins, may therefore send me their names and addresses and I will see that they are armed for the campaign with the most approved weapons. Who will be the first in the field? Uncle True.

LETTERS FROM BOYS AND GIRLS.

Snowdrop Drops Her Alias.

Dear Rural:—How do you do, Cousins all? You see I have jumped unceremoniously into your charmed circle once more. Thank you for such a kind welcome. But who is this I nearly stumbled over as I entered, and who rises with a young-woman-you-annoy-me, air? Let me take a nearer view; why, it is "Slayerofconceit! How do you do, my Lord? I think it would improve you very much to have the conceit taken out of you, but am afraid after the operation was performed you would be in a highly exhausted state, as there would not be much else left of you! I suppose from your extremely elevated position you look down on the rest of the cousins and expect them to do you homage; but I think I can safely say that neither "Madcap Mollie" nor myself reverence your lordship. "Madcap Mollie," I believe I have found in you a kindred spirit, and would like to know you personally. Why doesn't "Adel W." write again? I have an idea she effectually silenced young "Tom"; perhaps some of the cousins remember his efforts. I advise her to take "Slayerofconceit" in hand. "Hattie A." advises the little Cousins "to speak back!" That is just my advice. I perceive "Rocky Mountain Joe" has again appeared on the scene of action, and would say to him that I sincerely hope he is not one of the kind of boys that stay in the house and torment their sisters, while father is doing the work on the farm. A word to "Wild Fire;" I am afraid you injured your health trying to compose that poetry; poor fellow, didn't you have to take a general reprieve from all mental and physical labor the next day, in order to restore exhausted faculties? I don't think the boys can say anything to the girls about shoes; the style is *so* elegant! The shoe projects four or five inches beyond the foot, and then turns up like the rocker to a chair; that is the fashion. Boys, don't follow the fashions, you know! Then just look at those standing collars! They are *so* graceful and becoming! Look more like the sideboards to a wheelbarrow, than anything I can compare them to. "Solomon Sap!" what an appropriate name for the individual that bears it! A few words to "Uncle Trhe" and I shall close. I received the kind letter you wrote me, and thank you very much for it. I also received that "fine engraving," and would say that my hopes were realized, as one by one the wrappings were removed and the magnificent picture unfolded itself to my gaze. How my pulses quickened as I beheld such matchless coloring! such faultless drawing! and I would add that if all the cousins received such a beautiful present as I, they will all feel encouraged to try for another prize. Sincerely hoping this, my third or fourth effort, will appear in print I will bid adieu to the Cousins. I have written before under the name of "Snow-Drop," but will now sign my true name.

Norfolk Co., Va. Bertha A. Weeks.

An Old Friend.

Dear Uncle True and Cousins.—Whoop! Here I am again. You probably thought that I was gone forever; but I am like a bad penny—I always come back again. I have not written to the dear Old Rural for over a year, as we did not take it last year. I missed it greatly, I can tell you. I often wondered what was transpiring in the Cousinly camp; now that I take a survey of you all, I see that most are strangers. Where are Ellen J. S., Belle E. F., Young Tom, etc.? All exiled, I suppose, and "gone where the woodbine twineth." Oh, dear! all *gone!* Pardon, dear Cousins, for this untimely outburst of grief; but just wait till I get this tear wiped away, and then—give me your hands, Cousins, and let me make your acquaintance—yours especially, Mad-cap Mollie.

I see that most of the Cousins have had Christmas trees. We had an awfully dull Christmas here. There were heavy fogs and rains all day. But for all that, it was splendid weather for Christmas trees, as there were two feet or more of mud to plant them in! When people meet each other, the usual mode of salutation is, "Did you ever see such a winter?" The farmers in this section are afraid they cannot get their grain to market.

Well, Cousins, I suppose you will be out of patience, so I will not write any more to gain your displeasure. Hoping to see letters from you all again, I will withdraw from your pleasant circle until you hear again from

Macton, Can. Bouncing Bob, *alias* R. H. C.

An Ornithological Cousin.

Dear Rural Cousins:—I am a new Cousin, and have only just claimed relationship, although I have always read the letters that have passed between you. I don't know whether I am writing this letter to you or the waste-basket, but it is intended for you. I have heard great stories of that terrible waste-basket, but I hope it will not devour this. As you have never seen me, I may as well describe myself.

In the first place, I am a boy—a farmer's boy. I live on a small farm, one mile from a beautiful village in the central part of New York. I have been in my teens a little over two years. I go to school. Our school-year consists of two twenty-week terms, a ten-week vacation in the summer, and one of two weeks in the winter.

We are very busy this winter at home, wintering fifteen cows, eight calves, and eighty sheep. The most of them are Cotswolds, with a small sprinkling of fifteen Merinos mixed in.

I like colts very much, if they do not try to make love for their master too demonstrative. The other day my colt stood upon his hind legs in front of me, and brandished his fore-legs over my shoulder. I suppose he was trying to hug me; but I don't think I relish colt hugs.

I wonder if all of you are having as much snow as we are having here this month? We did not have any until the middle of January, and now it is making up for it. We usually have skating too; but this winter, as soon as the ice formed, it was covered with snow too deep to allow skating. If this first effort of writing to my new Cousins succeeds, you will hear again from your Cousin.

Jim Crow.

While Laboring Under Excitement.

Dear Uncle True:—I would like to say a few words to that "Young Orator," who comes into our ranks with such impudence. He seems to think that because I said some of the cousins were conceited, I am conceited too. Perhaps I am. But what would *he* say if *I* were to call him a falsifier simply because he did that to "Miss Bessie?" (as he certainly did when he insinuated that her poem was not original;) or to call him by a more opprobrious epithet as he did *me*. I may have said some harsh things while laboring under strong excitement; I may have jokingly called some harmless name, with no intention of offending; but *never* have I stooped so *low*, or been so *utterly* lost to all sense of *decency* as to call a person names barred by decent society. But to change the subject; how am I to get out of this scrape. It will never do to have the girls against me. I tell you it is fearful. What tempers they have got, to be sure! Since they have found that my name (according to my deeds,) is a misnomer, they have cooled off somewhat; and if I keep cool for awhile perhaps they will be in a frame of mind to listen to reason. Slayerofconceit.

The Puzzler.

ENIGMA.

In varied scenes I may be met,
In gold and jewels sometimes set;
Though often wrought in costly mold,
I'm sometimes for a trifle sold.
Adorning many a fair one seen,
The simple maiden and the queen;
I'm issued, too, by her command,
And some receive me from her hand.
While thus so costly I am seen,
I have the source of torture been,
And have my place in Church and State,
As well as at a ball or *fete*.
I many different figures make,
And many varied aspects take;
Yet still my form appears the same.
To some a spell lives in my name;
And yet I would not like to see
One that I love becoming me.

☞ Answer in two weeks. Jenny.

MISCELLANEOUS ENIGMA.

I am composed of 14 letters:
My 13, 6, 2, 9 is a mineral.
My 4, 5, 8, 7, 7, 10, 14 to engage in dispute.
My 3, 8, 1, 5, 6, 13 a man's name.
My 9, 6, 13, 14 a girl's nickname.
My 7, 2, 1, 11, 13, 10 to wander about.
My 4, 5, 10, 14, 13 to crush.
My 3, 2, 7, 6 to venture.
To take part in my whole gives much pleasure.

☞ Answer in two weeks. C. E. L.

CROSS-WORD ENIGMA.

My first is in lilac but not in aster,
My second is in oil but not in caster;
My third is in loose but not in tight,
My fourth is in eye but not in sight.
My whole is a flower.

☞ Answer in two weeks. Md.

Sabbath Reading.

IF WE HAD BUT A DAY.

Mary Lowe Dickinson.

We should fill the hour with the sweetest things
If we had but a day;
We should drink alone at the purest springs
In our upward way;
We should love with a life-time's love in an hour
If the hours were few;
We should rest, not for dreams, but for fresher power
To be and to do,

We should guide our wayward or wearied wills
By the clearest light;
We should keep our eyes on the heavenly hills
If they lay in sight;
We should trample the pride and discontent
Beneath our feet;
We should take whatever a good God sent
With a trust complete.

We should waste no moment in weak regret
If the day were but one;
If what we remember and what we forget
Went out with the sun;
We should be from our clamorous selves set free
To work or to pray,
And to be what the Father would have us be,
If we had but a day.

TRIALS BY THE WAY.

Austin Phelps.

The truth is, that we never feel Christ to be a reality until we feel him to be a necessity. Therefore God makes us feel that necessity. He tries us here, and He tries us there. He chastises on this side, and he chastises on that side. He probes us by the disclosure of one sin, and another, and a third, which have lain rankling in our deceived hearts. He removes, one after another, the objects in which we have been seeking the reposo of idolatrous affection. He afflicts us in ways which we have not anticipated. He sends upon us the chastisements which he knows we shall feel most sensitively. He pursues us when we would fain flee from His hand; and, if need be, He shakes to pieces the whole framework of our plans of life, by which we have been struggling to build together the service of God and the service of self, till at last He makes us feel that Christ is all that is left to us.

When we discover that, and go to Christ, conscious of our beggary in respect of everything else—wretched, and miserable, and poor, and blind, and naked—we go, not expecting much, perhaps not asking much. There may be hours of prostration, when we ask only for *rest;* we pray for the cessation of suffering; we seek repose from conflict with ourselves, and with God's providence. But God gives us more; He is more generous than we have dared to believe. He gives us joy; He gives us liberty; He gives us victory; He gives us a sense of self-conquest, and of union with Himself in an eternal friendship. On the basis of that single experience of Christ as a reality because a necessity, there arises an experience of blessedness in communion with God, which prayer expresses like a revelation. Such devotion is a jubilant psalm.

"I WILL STAND BY MY MASTER."

(A Motto for Sunday Teachers.)

What more beautiful words could be selected as a motto for Sunday teachers? They were spoken not long ago by one whose hair had grown white in the service of Christ. He knew what discouragement was, and he knew what disappointments were: he had just been speaking of them; but the thought of his Master gave him fresh courage, and the resolution with which he was filled found utterance in the words, "To my dying day I will stand by my Master." The calling of the speaker was a high one, his ministerial office undoubtedly the most honorable which any can fill on earth; but we too, dear fellow-teachers, are servants; our work is in the great Master's Sunday-school vineyard; and shall not we also be faithful to our Lord?

Our charges are watching us; they hear us tell of Jesus on the Sunday, and in the week they are keen observers of what their teachers do; perhaps none will know it sooner than the members of our classes if we desert our Master or dishonor our Christian profession. Isabel.

Life of the Good Man and the Worldly.—To what may we liken the lives of the good and the worldly?

Sometimes a life is like the mountain torrent, which begins its course wildly, dashing from rock to rock, and flashing in and out amongst the pebbles, until it at length grows calm and flows through the land as a rivulet, bringing health to the village home, and clothing the fields with a garment of verdure; such, with its imperfect commencement, in many a good man's course. Sometimes a life is like a rapid river which sweeps all before it with its impetuous energy and silent strength, but becomes rough and tempestuous when it reaches the ocean and is lost in its waters; such is the course of many of those who live only for the world. H. B.

The Sailor's Line.—Is it not unwise to believe where we cannot fully understand?

Surely not. A sailor's line may not be long enough to fathom the sea; but it may be of use nevertheless to keep his vessel off the rocks and shoals. Neither by our intellect may we be able to fathom all the depth of the ocean of religion; but reason may assure us that there is water enough for our ships to sail in without running aground.

PERSONAL ITEMS.

The death of ex-Secretary Gideon Welles leaves Mr. Blair the only living member of Mr. Lincoln's cabinet.

Skobeloff, the Russian general, is said to only thirty-three years of age. He is a very religious man. "One cannot face death boldly," he says, "who is not a believer in God and who is without hope of a better world." He leads the soldiers in prayer and joins in their peculiar chant, which is said to be very touching.

Mr. Theodore Roosevelt, a well-known citizen of New York, and who was recently nominated by the President as Collector of the Customs in this city but rejected by the Senate, died on the 9th inst., after a short illness. He was 47 years of age and had long taken a prominent part in the management of local charities.

Pius IX., at the time of his death, was eighty-five years and something more than seven months old. His great age, remarkable among Popes, was not remarkable in his own immediate family. His great-grandfather lived seventy-three years; his grandfather ninety-three years; his father eighty-three years; his mother eighty-nine years. Of his three brothers, Joseph died at the age of seventy-six, Gabriel at eighty-eight and Gaetan at eighty-nine years.

Agents Wanted.

"The neatest thing I ever saw."

"A necessity at every dining table."

THE PATENT NAPKIN HOLDER,

Illustrates the method of use.

Since its introduction, has met with an enthusiastic reception, and seems to meet a want long felt by every one. The parents buy it for their children, while gentlemen and ladies all over the country write, as soon as they receive and use the sample, that they "are so much pleased with it, they want more for themselves and friends." It holds a napkin or bib in place, so that the clothing is entirely protected. They are made of the finest quality of nickel silver, heavily plated with pure silver, and are connected with a heavy silk cord. They are also used very successfully as a skirt supporter, fastening on anywhere, and without injury to the most delicate fabric. The cut is shown one-half size, while that of the boy illustrates the method of use. Price per dozen, $3.00 by mail, postage paid; or a sample one will be sent on receipt of 25 cents. SPECIAL TERMS TO LIVE AGENTS, LADIES OR GENTLEMEN. Manufactured only by
THE NEW ENGLAND PLATE COMPANY, New Haven, Conn.

Matthews' Garden Seed Drill,
Matthews' Hand Cultivator,

TO ADVERTISERS! We will send free to all applicants who do any newspaper advertising, the THIRD EDITION of
AYER & SON'S MANUAL FOR ADVERTISERS. 160 8vo. pp. More complete than any which have preceded it. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists have been carefully revised, and where practicable prices have been reduced. The special offers are numerous and unusually advantageous. Be sure to send for it before spending any money in newspaper advertising. Address N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

Wit and Humor.

SPARKS AND SPLINTERS.

One old hat from America makes a New Zealander a whole suit of clothes.

Too long courtships are not allwuss judicious; the partys often tire out skoreing before the trot begins.

An Aberdonian recently bought a horse by photograph, thus literally getting the carte before the horse.

Nature seldom makes a phool; she simply furnishes the raw materials, and lets the follow finish the job to suit himself.

In reply to the question, "Will the coming man be bald?" the Norristown Herald affirms that "he generally is when he first comes."

Boots of the thirteenth century are occasionally dug up in London, with skeletons of cats of the same festive era. The relative positions of the boots and cats show that the ancients were not much better at aiming than we of to-day are.—*Danbury News.*

If you dream of a stuffed oyster-shell dancing in its ulster, to the tune of "Hold the Fort," while a club footed Indian looks on and chews gum, it is a sign that it is going to rain when your blonde cousin gets married. (If it is a brunette cousin, you have got to dream something else.)

If you dream of a ring-tailed monkey chewing bar soap on the top of an obelisk, and scratching the small of his back with his left hind foot, on which there is a blister of the eighth potentiality, and of two years' standing, it means that you will meet a cross-eyed girl the next time you go hunting for raccoons in a reservoir.

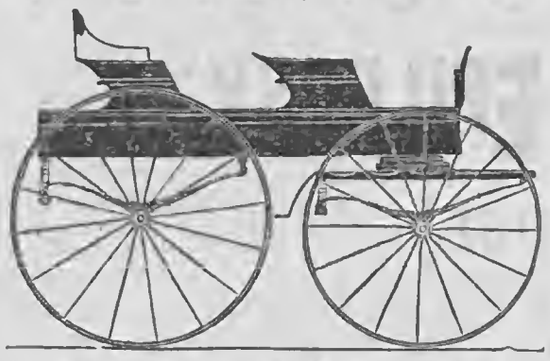
The Laboratory of the System.

The stomach is the laboratory of the system, in which certain mysterious processes are constantly going on. These result in the production of that wonderful vivifying agent, the blood, which, in a state of health, rushes laden with the elements of vitality to the remotest parts of the system. But when the stomach is semi-paralyzed by dyspepsia, blood manufacture is carried on imperfectly, the circulation grows thin and sluggish, and the system suffers in consequence. Moreover, indigestion reacts upon the liver and bowels, rendering the first sluggish and the latter constipated. The brain also suffers by sympathy, and sick headaches, sleeplessness and nervous symptoms are engendered. Hostetter's Stomach Bitters reforms this state of things, gives permanent tone and regularity to the stomach and its associate organs, the bowels and liver, and ensures complete nourishment and increased vigor of the system. It is the most popular as well as the most efficient anti-dyspeptic and tonic in America.

FARM FOR SALE.

Fine STOCK or DAIRY FARM of 400 acres, in Steuben Co., N. Y. Good Orchards; 70 acres Timber and Sugar Orchard; convenient to Churches and Schools. Price $14,000; $3,000 down, balance on eight years' time. This is a rare bargain. Address C. H. UPTON, Rochester, N. Y., or Mrs. M. BAKER, Box 382, Hornellsville, N. Y.

THE CORTLAND



Platform Wagon.

To the Farmer and Dairyman, to whom a light-draft, easy-riding Wagon, capable of carrying from ten to fifteen hundred pounds, is a necessity, this is the

CHEAPEST AND BEST

Platform Spring Wagon made.

Every Wagon fully warranted.

If there is no agent or dealer in your town, send for Circular and Price List to the

CORTLAND WAGON MF'G CO.,
Agents wanted. Cortland, N. Y.

THE AMERICAN HAY ELEVATOR.

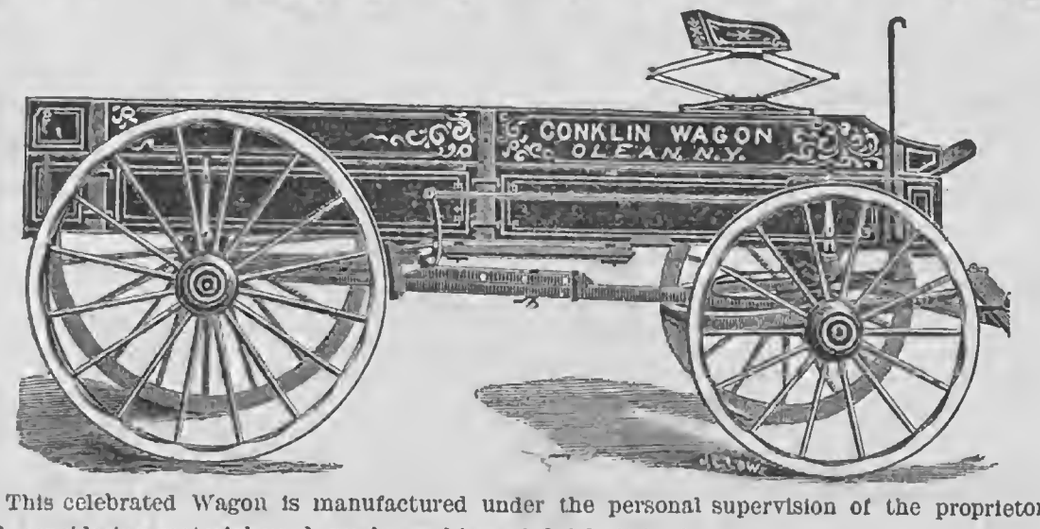
The most perfect, simple and ONLY Elevator that raises the hay from wagon and carries it in barn any required distance. Economical, durable, labor-saving. Send for Illustrated Circulars and prices to

J. R. FITZHUGH,
1708 Barker St., Philadelphia, Pa.
Branch Office: 55 Beekman St., New York.

TOO MUCH LUXURY.

Stout Party.—"Want your wages raised because you've been laid up so long with rheumatic gout! Why, your illnesses are accounted for by the way you people live. You think of nothing but eating and drinking. High wages are the cause of the moral and physical degradation of the working classes. Let mo see, you get nine shillings a week; I shall take off two shillings; you will then be a much healthier and happier man."

THE CONKLIN FARM WAGON.



This celebrated Wagon is manufactured under the personal supervision of the proprietors, and, considering material used, workmanship and finish, it is the

CHEAPEST and BEST FARM WAGON in the MARKET.

Every Farmer, Teamster and Lumberman should have one.

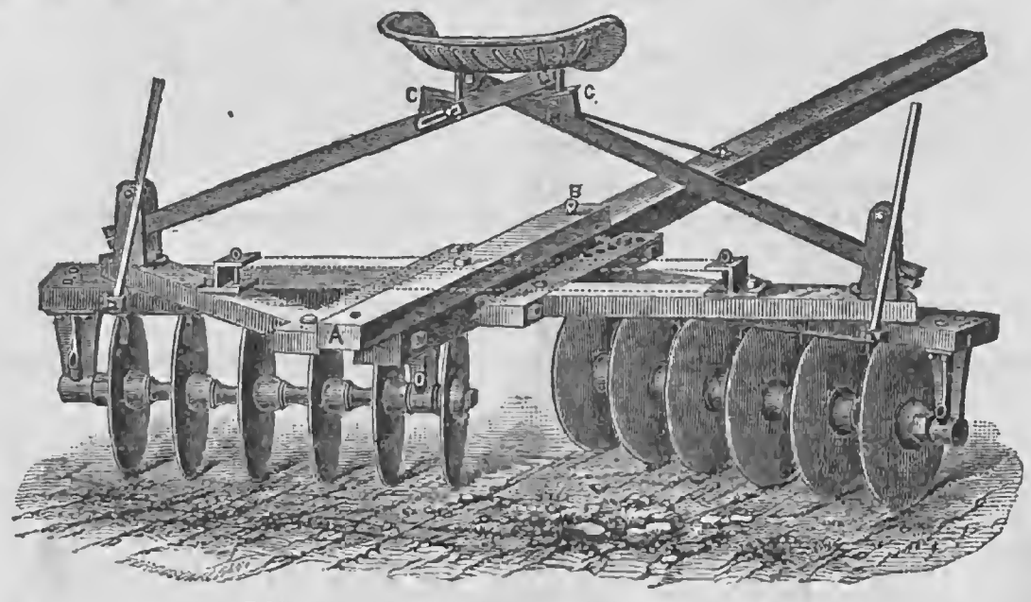
EVERY WAGON FULLY WARRANTED.

If there is no agent or dealer in town, send for Circulars and full particulars to

W. H. & D. C. CONKLIN, Olean, N. Y.

BRAMER & RANDALL'S

PULVERIZING HARROW.



A ROTARY, VERTICAL PLATE WHEEL HARROW.

Its Value Established by Abortive Imitations.

IT HAS NO EQUAL!

ECONOMIZING TIME! SAVING LABOR AND MONEY!

SECURING THE LARGEST CROPS!

No wonder there are over

10,000 IN USE!

To meet the growing demand and various wants of the Farmers throughout the country, 10 different sizes and styles of this unequaled implement for thoroughly pulverizing the soil are made.

IT IS THE ONLY PRACTICAL JOINT WHEEL HARROW

made. Can be changed from a jointed to a stiff harrow at the pleasure of the operator, in a moment's time, and does not Involve a lawsuit for Infringement of Patents to the seller or purchaser, as is the case with its imitators. *Agents wanted.*

OUR PLANT-PORTRAITS.

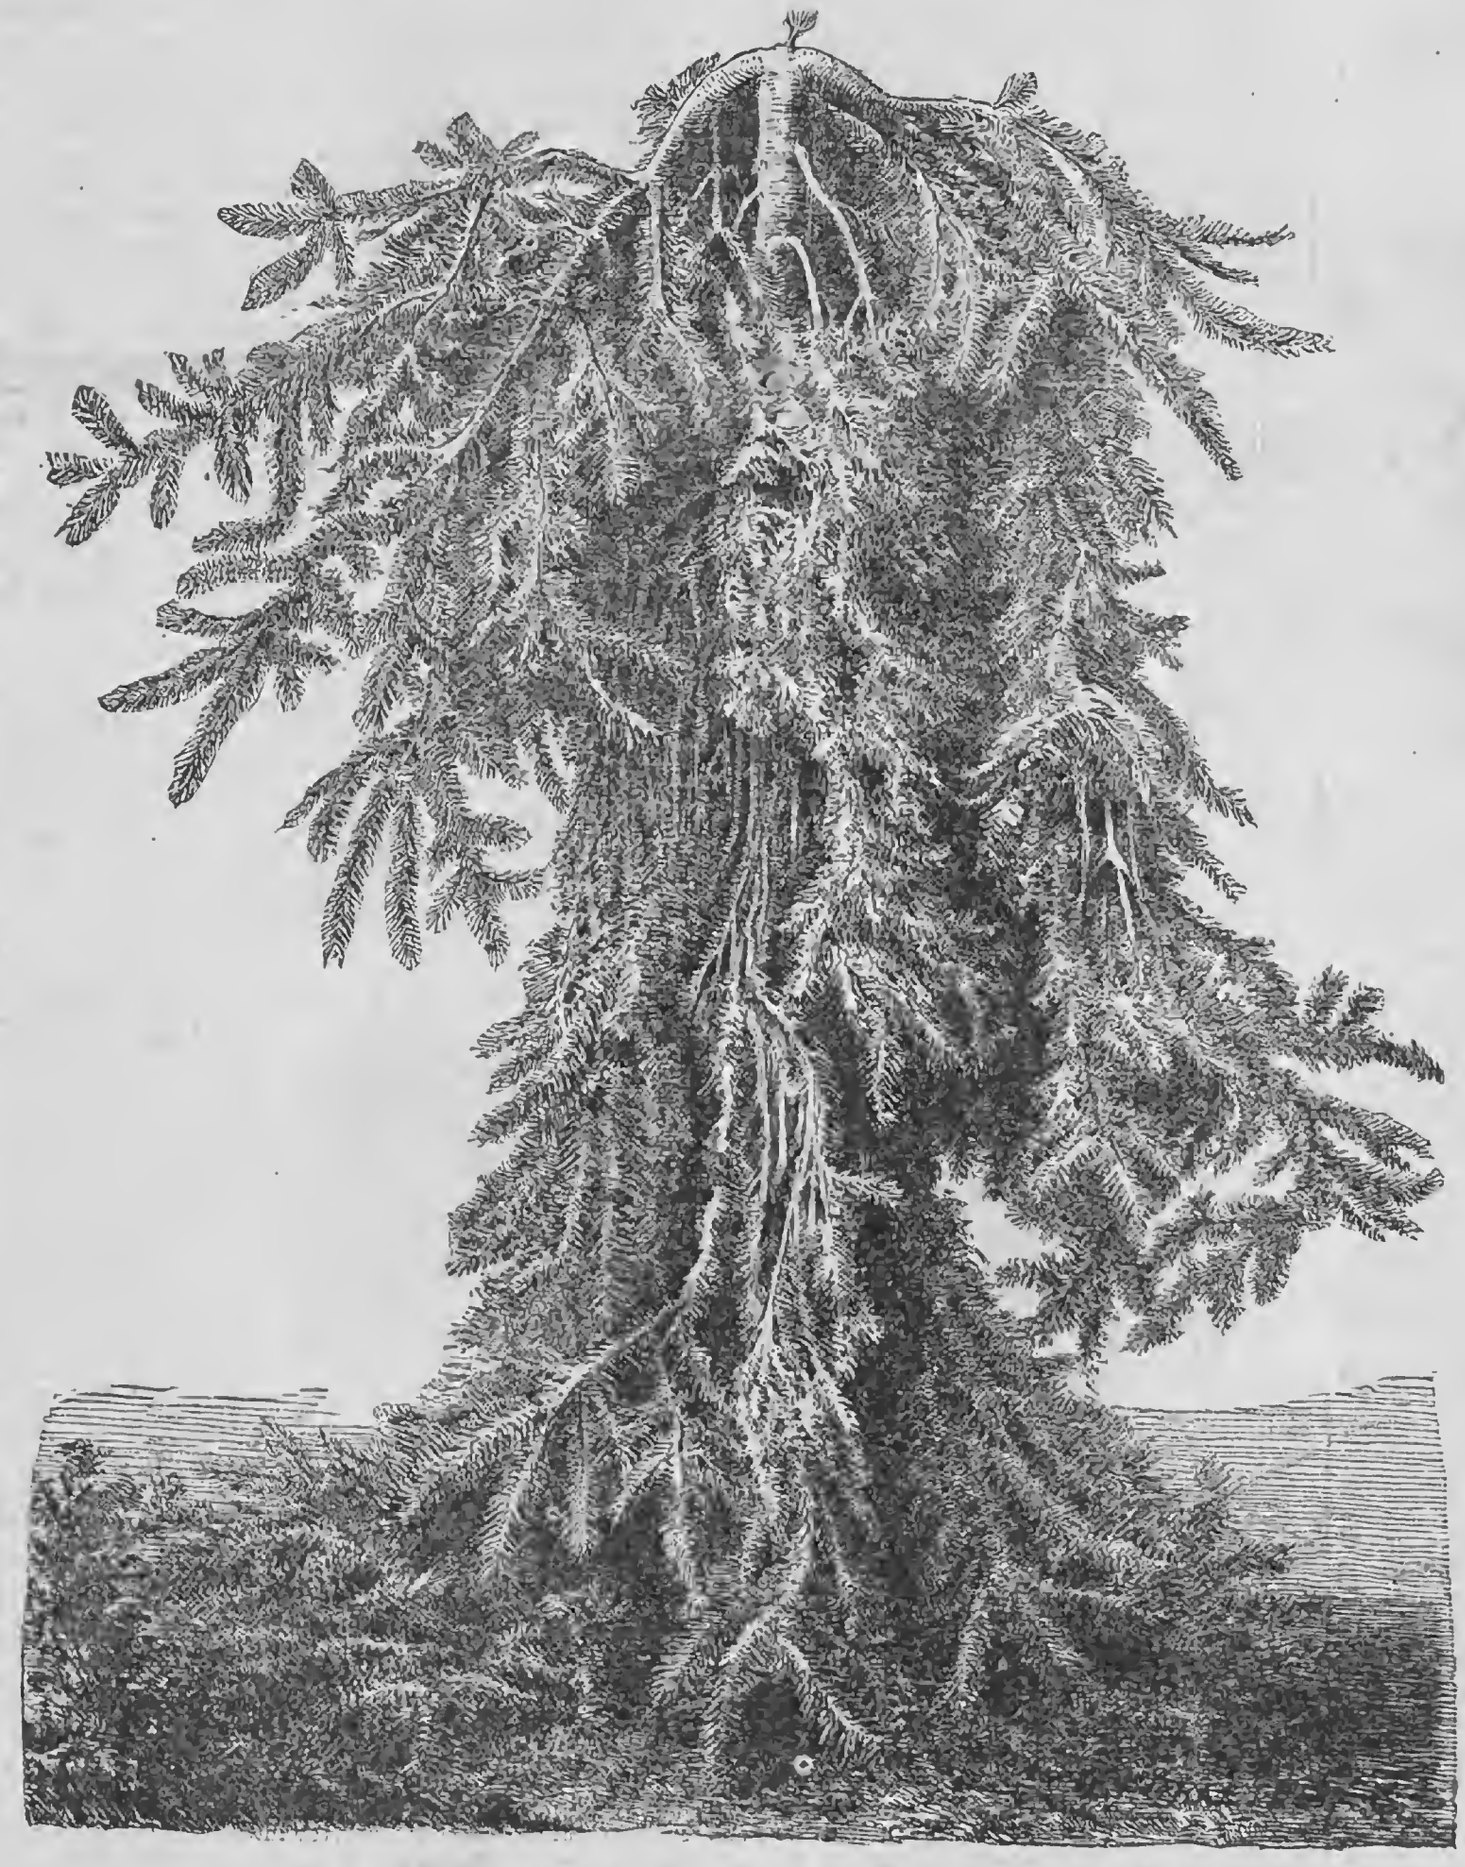
THE WEEPING NORWAY SPRUCE.—(Abies excelsa Inverta.)

This curious evergreen (of which the accompanying sketch is an exceedingly accurate portrait) belongs among the rarer and choicer kinds of hardy ornamental trees. It is not an old variety, having been first offered to the trade some twenty-five years since. The specimen—about five and a half feet high—from which the sketch is taken, stands near the house of Mr. S. B. Parsons, Flushing, L. I., in which spot it has been planted some six years, being at the time of planting about eight years old. No assistance, in the way of pruning, has been given to it, except an amputation performed on the leader once or twice, in order to encourage bushiness at the base. A good stout stake has been employed to induce an erect growth, but only because it had been neglected in this particular during early youth.

The curves of the branches are not strictly weeping, as the term is usually accepted; but after drooping down and hugging the stem in the most determined and melancholy fashion, continue here and there to burst away and turn up with strange vigor and eccentricity. In fact, the name Inverta well indicates its peculiar nature, for inverted it is in every way. This very waywardness would readily suggest the idea of a fountain of green foliage, only that there is a certain sedateness that could only belong to the fountain if suddenly frozen.

Like the parent Norway Spruce in most of its qualities, it transplants easily and is of a very hardy and healthy nature, though, like all weeping or variegated plants, it is more dwarf and of slower growth. It is, therefore, specially suited for planting near the house or in cemetery lots. By tying lightly to a stake and removing only the tips of branches, the effects of pruning need never become very noticeable. It is also quite important that such training should commence in early youth. Later in life, it is liable to distort if neglected. It will be found, therefore, a great advantage if the plant purchased has been treated in this manner. Many nurseries allow them to straggle about in the row until one hardly recognizes the plant.

The proper position of this tree on the lawn, is in some conspicuous place, where its grotesque yet graceful form may be fully open to view. To accomplish this, it should be planted in an open space, or among low, broad evergreens. For the same reason, it would be especially beautiful, as already remarked, occupying the position and suggesting the idea of a fountain in the center of a small lawn or grass-plot. Perhaps, as a rule, it should always be planted singly, although we do not doubt that very effective groups might be made by combining it with contrasting evergreens. The group, however, in this case, must be arranged with some knowledge of the nature of the individual plants, otherwise there will grow up an incongruous mass. This remark may be also considered true of any grouping of ornamental plants, but it is especially true of the Weeping Spruce.



WEEPING NORWAY SPRUCE.—(From Life.)

WHAT SHALL I PLANT?

No. 1.

SAMUEL PARSONS.

Twenty years of experience have proved to us the serious difficulties encountered by those called upon to answer this question. A large catalogue of trees and shrubs, with full descriptions, is presented for inspection; but the space in any catalogue is too limited for really satisfactory descriptions; and such problems as, "What shall I buy to make up groups of flowering shrubs or many-colored evergreens?" are left practically unanswered. If the lawn be only in the first stages of construction, the landscape gardener may be economically employed; but every one interested in plants desires to add to their number continually. To assist such, we desire to make a few suggestions, and name a few of the choicest plants, with some of their uses.

It may be assumed at once that common trees, like Norway Sprnces, Maples, or White Pines, belong to the original frame-work or outline of the place, and hardly come within the scope of our present remarks. They are rarely added to or changed from year to year, unless the place is radically altered or enlarged, and our present wish is to call attention specially to such plants as give a rich finish and variety to an otherwise old and fine place.

First and foremost we want groups of Rhododendrons, planted three feet apart and selected from the hardiest Catawbiense varieties. These must be planted in position somewhat protected from the north and northwest, and covered with evergreen boughs for at least the first winter. Let the soil be loamy, rich and well drained, and especially not raised into a mound above the surrounding surface. You will thus obtain a crowning effect on the lawn, and abundant flowers the very first year.

The Ghent, or Hardy Azaleas, of varied hues—rose, crimson, white, and orange—are hardly less grand than the Rhododendron, and no less exquisite. They may be fringed about Rhododendron beds, or planted in effective masses by themselves. Their treatment should be much that of Rhododendrons, as to soil, &c.

Of slower growth they may be planted from two to two and a half feet apart, and given less protection, as they are very hardy, and profuse bloomers.

Splendid masses of color on the lawn may be formed with Hydrangea paniculata grandiflora, the great flowers of which appear in August—first white, changing later in the season to purple, pink, and dark-red. No lawn can afford to spare any of these effective groups, as they give the choicest bloom throughout the summer.

The proper disposition of various flowering shrubs—Wiegelas, Spiræas, &c.,—in groups, or belts for screening unsightly objects, so that flowers may appear scattered throughout the mass during several months of the year, is productive of the best results in perfecting the details of lawn planting. Then, here and there, along walks, or on the outskirts of the lawn, may be planted singly such choice flowering shrubs as Cercis Japonica, Exochorda grandiflora, Viburnum plicatum, Magnolias Halleana and conspicua, Dwarf Horse-chestnut, and Stuartia pentagyna, so beautiful in midsummer. All these are of good size, and suited to prominent positions. Nearer the house, also on the edges of walks, such flowering shrubs may be employed as the sweet-scented and delicate Daphne Cneorum, the Rhodora Canadensis, the Hypericums, and Flowering Almond, all blooming at different seasons.

We have thus dwelt briefly on the finest flowering plants, and given a few hints as to their proper arrangement on the lawn. Indeed, all such are particularly fitted to add the more delicate forms and colors, that amid the massive proportions and shades of the Oaks, Maples, and Spruces, enhance so greatly the charm of the entire effect.

There are yet other plants well suited to increase this same effect, concerning which we may, at a future day, hope to offer a few practical remarks.

MID-WINTER BEAUTIES.

As we walk about the RURAL GROUNDS to-day, there are several plants that are attractive beyond most others. They show that with a little care in making selections, the winter garden might be made far more interesting than it is.

The Golden Retinospora is now as richly golden as in the early fall, and must be ranked among the first of hardy winter plants. It is charming at any season of the year, perhaps most so just after it has made its growth in spring, when the new shoots present an incomparable freshness and delicacy of coloring. But now we prize it more in contrast with the dull brown or olive color of Arbor-vitæs, Spruces, and Firs, and see that all vegetable life is in the very depths of its wintry rest. There are some plants so beautiful that we are impatient at their slow spread and appreciation. Spring is upon us. We tell our readers, who have plants to order, to include this.

Shall we implore them to do so? Shall we say, "Do it if you value our friendship?" And then should the plant disappoint them—what then? Then they need not ever speak to us again. So you see, RURAL friends, how much we are willing to hazard upon the beauty and worth of the Golden Retinospora.

The variegated Pinus Massonianus is a tree of great promise for this climate. Its "needles" are now of a bright yellow, and it has thus far stood the winter without the least injury. Our account of it, with an engraving, a few weeks since, will be remembered.

As a winter out-of-door plant, Yucca filamentosa is of rare merit. For hill-sides, lake-borders, or clumped here and there among dwarf evergreens, its long curved leaves, which remain quite green through the winter, are always pleasing to look upon.

VARIEGATED EUONYMUS RADICANS.

Kalmia latifolia, our Mountain Laurel, is now one of the greenest shrubs to be seen. It is quite common in some of the woods within a short distance of these Grounds, and yet it is rarely to be seen in the gardens of the neighborhood. Several have tried to transplant it without success.

It is only necessary, however, to dig about the roots, so that the soil may adhere to the fibers which grow near the surface, and to shade the plants during the first spring and summer. Their flowers, which vary from white to rose, are both odd and showy. (See page 137.)

Among deciduous shrubs which attract the eye in winter and are worthy of a place in our winter garden, is the blood-wigged Dog-wood, Cornus stolonifera (or sanguinea of catalogues). The stems are as smooth as glass, and of the color of blood, so that, especially when snow covers the ground, they stand out conspicuously. The variegated Euonymus radicans is also a sturdy dwarf bush with evergreen leaves of light green margined with white. (See cut).

There are scores of plants that are as pretty in the winter as in the summer, a happy selection and arrangement of which, as we stated in the beginning, would render gardens during that long dreary period, rather more inviting than they seem to be at present.

Prof. Gray, in the American Agriculturist, tells of Mr. Francis Parkman's experience in crossing Lilies. We cannot give the particulars. But the gist of it is, that with only two or three exceptions, all the seedlings closely resembled the female plant. Liliums auratum, speciosum, longiflorum and superbum were the species used for crossing.

Prof. Gray concludes his article as follows: "All this is very curious indeed. We knew that offspring might take a great deal more after one parent than the other. But that the female sex should be so prepotent in Lilies, is a quite unexpected result. That in so many cases the influence of the male parent should be imperceptible is most wonderful."

Several years ago, the writer became interested in crossing Pelargoniums, the main results of which were published in these columns a while afterwards. In the hopes of producing a variety which should bear flowers as intensely scarlet as Jean Sisley, with a pure white center much larger, we crossed it with Madam Vaucher, one of the oldest white Pelargoniums, and still one of the best. From the seeds thus obtained, we raised at least fifty plants, and *every one* was scarlet, most of them with a white eye smaller, and not one larger, than Jean Sisley. This was made the female parent because it formed seeds far more readily than the pollen parent Vaucher.

In our other crosses with Pelargoniums, also, it always seemed that the female parent, was more potent in impressing itself upon the seedlings than the male, but as in these instances we were simply striving to obtain improved varieties, we cannot speak with any precision.

It may appear from the above that there are other genera besides Lilium, the seed bearers of which, when crossed with other species, are more potent than the pollen parents in transmitting their likeness.

Rural Grounds, Feb. 20.

The Horseman.

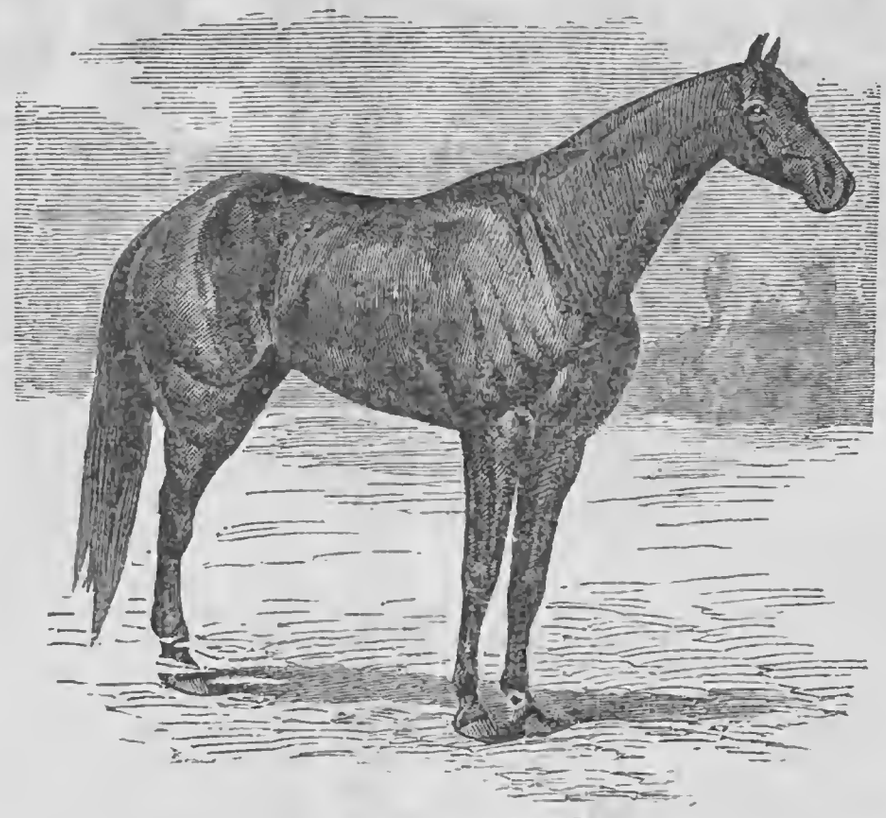
NOTED TROTTERS. NO. 2.

CASSIUS M. CLAY, JR.

IN the once splendid horse, Cassius M. Clay, Jr., now somewhat aged, is liberally united the blood of the famous Bashaw with that of the still more illustrious Messsenger.

The Bashaw race owes its origin to Grand Bashaw, a horse imported from Barbary, and it has been represented principally through his son, Young Bashaw, and the latter's sons, Andrew Jackson, Black Bashaw and Saladin. The first of the trio was also the first stallion that ever trotted in public, his best performance having been in 1835, when he trotted two miles in 5.18. Before his day, the opinion was general that entire horses would be ruined for service if "put through the mill" for racing purposes. Cassius M. Clay Jr., is his great-grandson through Henry Clay and old Cassius M. Clay, also the sire of George M. Patchen. It is pretty generally conceded that the Bashaws are inferior to the Messenger line as natural trotters; but it is no easy matter to separate them, as Young Bashaw's dam was a Messenger mare, and in many other cases, also, the lines have been intimately mingled. For instance, Cassius M. Clay, Jr. received, through his dam, another strong dash of Messenger blood, his maternal grandsire, Chancellor, having been by Mambrino, son of the far-famed Imported Messenger.

From this gray, thorough-bred, English horse, imported into this country in the latter part of the last century, all versed in the origin and characteristics of the American trotting horse, concede that the highest types of that valuable race are descended. Indeed, in view of the excellence of which he was the founder, and of the vast extent of the interest that has sprung from his loins, it has been well remarked, though perhaps with just a trifle of enthusiastic exaggeration, that when he descended the gang-plank of the vessel that brought him over, the value of not less than one hundrod million dollars struck our soil. Before his death, in 1808, he covered in this country, during 20 seasons, and as he had plenty of mares and was a sure foal-getter, it is estimated that he must have been the sire of about 1000 horses. His sons also were long-lived and as constantly employed in the work of increase as himself, and his grandsons likewise impressed on their multitudinous progeny the excellent characteristics he owned and conferred. Now, taking into account the remarkable power these horses had of stamping their living image on all their get, and of infusing into their sons and daughters the attributes of pluck, resolution, and endurance, some estimate can be formed of the vast influence Messenger has had on the trotting stock of this country. Experience has shown that the blood of this celebrated horse "hits" with almost any other strain, a fact that increases the value of the pedigree of Cassius M. Clay, Jr. This stallion is of a rich brown color, and nearly 16 hands high. His legs are clean and flat, his shoulders sloping his chest deep and back short. He has powerful hind-quarters, a beautifully set-on head, a flowing mane, heavy tail, and a fine, graceful carriage. His eye is marvelously full, and his hoofs round and solid. He has now a numerous progeny, favorably known among the "Clays."



GEO. PALMER.

GEORGE PALMER.

Some military commanders, like William of Orange, for instance, have achieved an honorable reputation for generalship, although pretty uniformly unsuccessful in the field, and similarly, George Palmer, who died a couple of weeks ago, won high distinction for speed, although ordinarily unlucky on the trotting track. Like the English King, his misfortune lay in that he was far too often matched with the very few rivals just able to baffle him. Lady Thorn, Goldsmith Maid, American Girl, and Lucy, the illustrious quartette of mares, that since the withdrawal of Dexter, have generally carried off the highest honors of the trotting track, were, all or most of them, his chief competitors in his most famous efforts. Although more than once he outstripped each of these in individual heats; still one or other of them was fortunate enough in nearly every instance, to win the chief honors, and, better still in their owners' eyes, the first money. For instance, on the 8th of October, 1869, in a race with the four mighty mares at Narragansett Park, he won the third heat in his best time, 2 m. 19¼ s., and carried off the second money; but Lady Thorn gained the race, after having won the second heat in her best time, 2 m. 18¼ s.

George Palmer was a bay gelding, small, narrow, and light in the bone, and at first sight few would consider him as fast and enduring as many closely contested races proved him to be. It is generally believed that his sire was a horse called Lame Bogus and his dam an unknown mare; but late researches prove that Lame Bogus died in 1843, while George Palmer was not foaled until 1861. According to WALLACE'S recent discoveries he was bred by ALLEN WATSON, of Stafford, Genesee County, N. Y., and was got by Ames' Bogus, known after his son had become famous as Palmer's Bogus, a grandson of Lame Bogus, through his son Ballard's Bogus, a fine bay, 16 hands high and an excellent roadster. Palmer's dam was a chestnut mare, said, without sufficient investigation, to have been a daughter of old Henry Clay, the sire of Cassius M. Clay, and progenitor of the Clay breed of trotting horses.

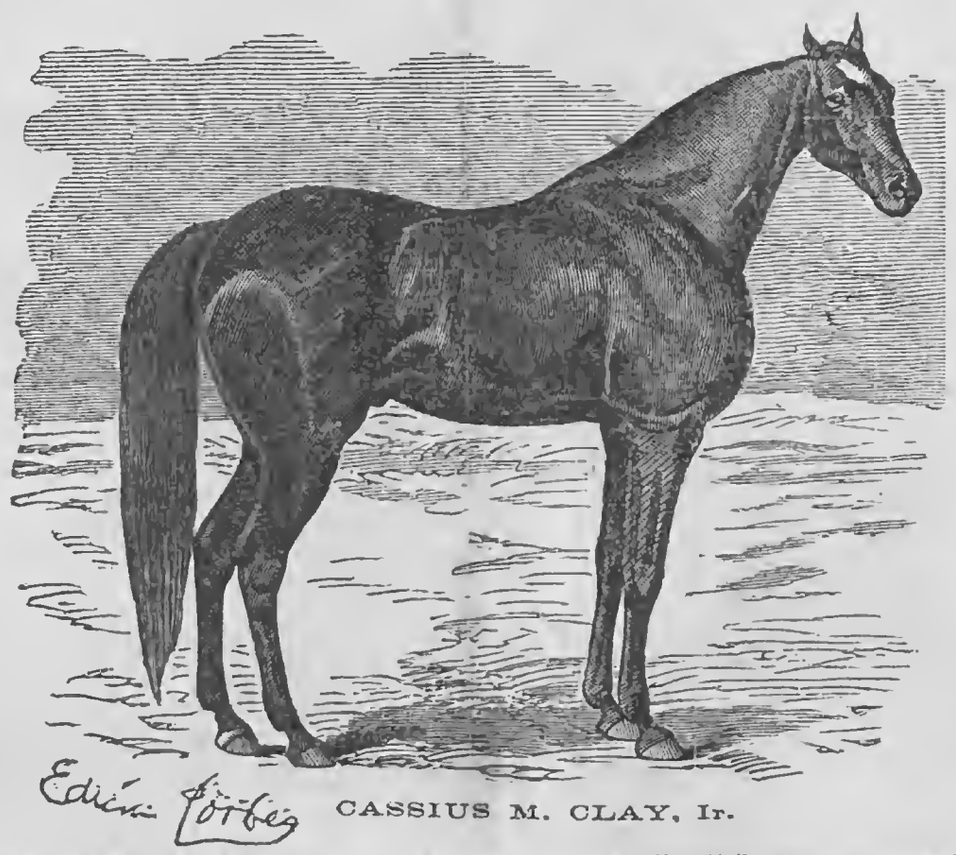
Farm Topics.

WHY CITY FARMERS FAIL.

WM. J. FOWLER.

THE stress of the time is compelling thousands of families who have heretofore lived in cities, to go to the country. Men who have failed in other business take the remnants of their fortunes and betake themselves to the country with the idea that they can make money by farming. Almost invariably this idea has proved delusive. Men who do not succeed in avocations where they have spent their best years and which, it is to be presumed, they understand, will not usually do better in a business about which they know little or nothing. Farming especially is a poor business for beginners. It requires considerable capital and unless this is carefully watched much is sure to be wasted. Besides, at the best, farming is never a very profitable business. During the last four years only good farmers have made any thing more than a living. If we are to have an influx of thousands crowded out or starved out of the cities the prospect ahead is quite as blue. Farming is a safe business, but even this is only true of experienced farmers, for they are invariably so cautious that they would make any business safe. If the beginner in farming thinks of going ahead at railroad speed, there is just as much likelihood of a smash-up on the farm as on the rail.

We know very well the answer which will be made to these forebodings. It is that the city farmer proposes to do so much better than all his neighbors that his increased expenses will be more than met by still larger profits. They know only the rose-colored side of farming. "Nature works for the husbandman. He plants or sows the seed and the crop is growing while he is sleeping." These and like aphorisms have satisfied them that farming is a simple and easy business. If farmers do not make money, it is because they are so incorrigibly stupid and old-fogyish. With all their doubts about the ability of average farmers, they have none



CASSIUS M. CLAY, Jr.

whatever as to their own, "Wait till we get on the farm, and we will show the natives how good crops are grown!" This is the thought and often the language of men who hope some day to be farmers. We met such a one years ago, who had bought a hundred-acre farm and retired from professional business. "I presume I shall have no trouble in managing the farm. I have learned that the secret of success is always to use plenty of manure on every crop." "Certainly," we replied, a good deal piqued by his affected mastery of the mysteries of farming in one easy lesson. "It is just as easy, Doctor, as your old business. The secret of success in medicine lies in always giving remedies adapted to cure the disease. It is all simple and easy." The Doctor took the hint. He became afterwards an excellent farmer, but he learned how difficult it often, and indeed always, is to follow his excellent agricultural prescription, "Plenty of manure for every crop." That is exactly what we all want, but how and where shall this enormous amount of fertilizers be obtained?

Good practical farming involves a greater amount of thought than any other avocation. The conditions of success are more complex than in any other. It is, least of all, a business for lazy, listless men who dread the drudgery of thinking. Nor is more acquaintance with the ideas and practices of progressive farming enough. There must be practical experience on the farm and some degree of practical work and attendance by the owner. Thousands of farmers fail for lack of this, especially men who disdain to learn the ways of common farmers in the conceited assurance that they can do a great deal better. There can be no greater mistake than this. If we want to improve anything the first requisite is to thoroughly understand its methods and management. No man learns to be a superior farmer until he first learns how to be a good ordinary farmer. Honest JOE GARGERY'S advice to PIP, when that young gentleman aspired to be something uncommon, contained a world of shrewd and homely wisdom. "You will never get to be uncommon till you have first got to be common." This is true of almost everything and is especially true of farming.

Possibly the later recruits to the agricultural interest come with humbler notions and more teachable spirit to learn its mysteries. If so, their chance for success will be so much the greater. It is best at first to attempt no innovations on the established customs of the neighborhood. Improvements are doubtless possible, but let them be suggested by practical experience. This may make progress slow; but it will be sure, and it may save you from mortifying failures. After you have first become "common" there may be hope that you will become "uncommon." In the meantime there is consolation in the fact that farmers throughout the country are reasonably sure of a good living, and that is more than thousands in the cities have been able to make these last few years. It will require some work, but this is only fulfilling the original decree passed upon man that in the sweat of his brow he should earn his daily bread. Trying to evade this decree, is one chief cause of hard times. When we see a return to habits of industry, the revival of all honest business cannot be long postponed.

RURAL TOPICS.

T. B. MINER.

HOW TO MAKE FARMING PROFITABLE.

I WILL lay down a few rules for successful farming as follows:

1. Have order and system in all you do, having in your mind in advance what crops you intend to grow; and provide the seed, so that no delay will occur when the time comes for sowing and planting. You should also closely estimate the amount of stable dung that you can spare for crops, so that in no case shall a crop be grown on land that has already been overcropped, unless some fertilizer has been applied to it.

2. Obtain good help, if possible, as half of your success depends on the kind of hired help you have; and don't employ too many hands, as a man and a boy will often do as much as two men, especially if the latter are left to work by themselves, as they frequently spend half of their time in talking; but a man is not apt to talk much with a boy, and the consequence is that he attends to his work. Of all the nuisances that I ever suffered on a farm, I have found gabbling help to be the most unprofitable. When I hire a man, I tell him plainly that he must not "fool" away his time (my time) in talking to other men while at work, unless he wants his "walking papers."

3. Work *with your help*. This is the key that unlocks the door that leads to prosperity; but don't say any more to them while at work than is necessary, as you will set a bad example by telling "yarns" etc. Suppose that a farmer is hoeing corn with two or three men, and he says, "Boys, have you heard the news?" And he and all stop work, or partially stop, to hear the "news," which takes, perhaps, 15 minutes to relate, and what little corn is hoed while the "boss" is relating the "news," is but half-hoed, and might as well not have been hoed at all. Now, a day is made up of *minutes*, and the waste of a few in this or that way constantly during the day, is sure to result in unsuccessful farming in the end. Say to your man, in plain English: "Shut up and attend to your work, or take your money and go. I hire men to *work*—not to spend their time in talking."

HOLSTEIN BULL "UNCLE TOM."

4. Don't covet the name, "he is a good man to work for"; but rather the name that I had many years: "He is a hard man to work for, but he is good pay." That meant that I made my men do a fair day's work, which hired men now-a-days call "hard." The fact is, farmers, that nine farm-hands out of ten won't do half a day's work, on an average, if you are so easy with them that they call you "a nice man to work for."

5. To do good work, you want the best farm implements that you can obtain, and plenty of them, so that if one gets out of order while in the hurry of work, you can use some other implement till the broken one is repaired. You will save money in the end, by throwing away your old plows, which were made about the time of the deluge, and getting the best patterns, with steel mold-boards, as they pay for themselves in a single season in the saving of horse-flesh in their draft. Again, see the old rusty hoes that many of you use, bought perhaps twenty years ago! Take out the handles and sell the hoes as old iron, and buy new ones, because you can do one-third more work, and do it much better, in a day with one of the most improved new ones, than you can with one of those old stubs that some of you use.

6. Feed your land, if you expect it to feed you. Make all the manure that you can, as this is the bank that pays your drafts and notes. The best farm that exists may be ruined in a few years by a continued cropping, without applying manure; and put under the plow only what land you can fertilize liberally. Adopt a rotation of crops, and keep your pasture and meadow lands in good condition, as the profits on your cows depend on the quality of their pastures, and the quality and quantity of hay that you cut; and keep good stock, as a cow that gives twenty quarts of milk a day, can be kept almost as cheaply as one that gives only five quarts.

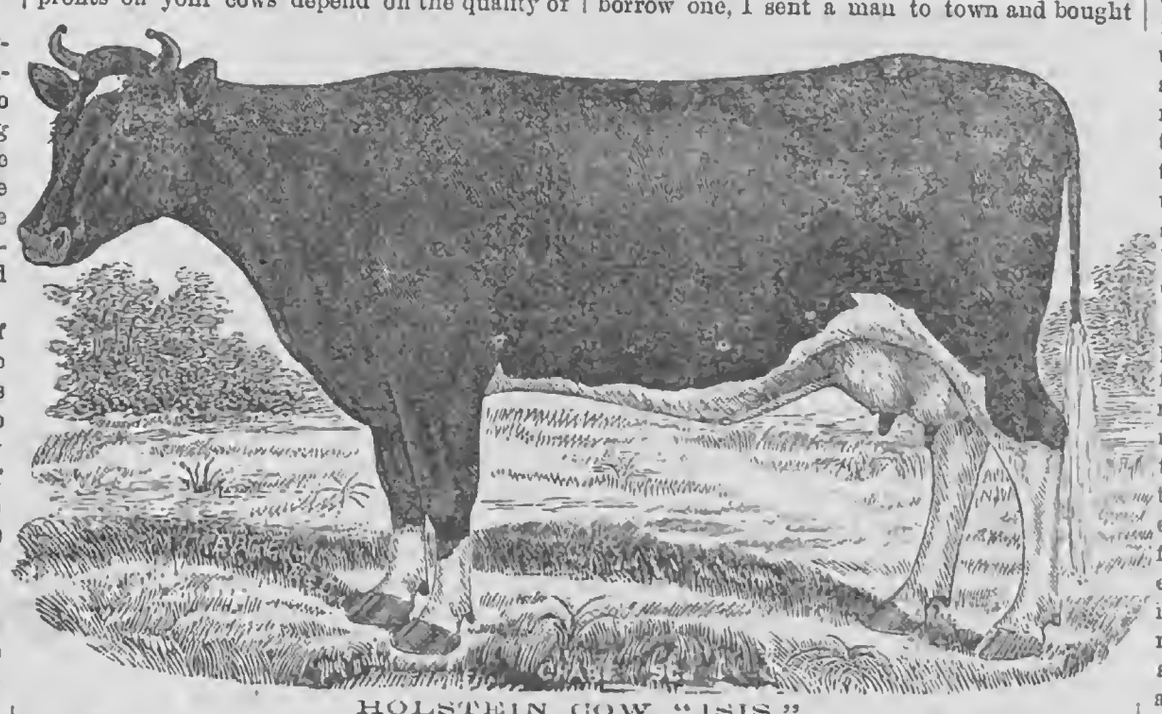
7. "What is worth doing, do *well*." Put this into your memorandum book where you can see it often. Did you ever hear of a slovenly farmer getting rich? No, not one of you. Then do your work well, as it pays the best in the end. If you are making fences, make them to stay as built, for years. A good farmer may be known by his fences alone.

8. Carry a memorandum book in your pocket, in which to note down things that are to be done, or that are wanted; and by so doing you will save much time. Your team, for instance, is going to the village. You refer to your memorandum book, and you find, "plow-share to be sharpened," "a new helve for ax," "nut for mowing machine," and other things that you would not have thought of, if they had not been noted down in your book; so this may save you the time and trouble of sending again to town the next day. Farmers, there is money in *head-work*, as well as in your physical strength.

To-day is pleasant, and you and your help are at work in the fields. Now, suppose you think over in your mind, "What can we do if it shall rain to-morrow, or next day, or at any time?" Well, the idea strikes you that you have a few hundred fence posts in the woods, that could be holed on a rainy day, under your barn-shed, if you had them there; so after dinner you send a team for a load or two of posts, as the weather seems to forbode rain soon, and the next day a storm comes on, and your hired men are kept busy at the posts. So you see how profitable it is to do a little "head-work" occasionally.

9. Don't borrow farm implements of your neighbors. This is one of the rules that every farmer should heed, as it prevents your neighbors becoming your enemies. If a farmer has a good implement, he had rather, in many cases, give his neighbor a dollar than lend such implement to him, as, in most cases, it will be returned to him injured, or out of order. Indeed, if the owner does not have to send for it two or three days after the time that the borrower agrees to return it, he may consider himself fortunate. Every farmer should buy every kind of implement that he may need. I once had occasion to use a large stone sledge-hammer—one large enough to break stones of 200 or 300 pounds weight to pieces. A few hours' work was all I had for it; but rather than borrow one, I sent a man to town and bought one for three dollars; and I have found it very useful in driving stakes into the ground in making fences, and for various other purposes. So I say to farmers, *don't borrow*, but buy what you need.

LINDEN, N. J.



HOLSTEIN COW "ISIS."

The Herdsman.

HOLSTEIN BULL AND COW "UNCLE TOM" AND "ISIS."

WE have the pleasure of presenting the readers of the RURAL, portraits of two fine animals of the Holstein breed belonging to the herd of Messrs. SMITH & POWELL of Syracuse. The bull, "Uncle Tom," by "Rip Van Winkle," out of "Topsy," was two years old in April last, and when put on the scales in October, weighed 1710 pounds. The cow "Isis" is his full sister, was four years old last summer and then weighed 1510 pounds.

Mr. W. R. SMITH has recently returned from Holland bringing with him ten yearlings, two two-year-old and one four-year-old cow, for this herd. They are represented as a very superior lot; even in size, uniform in color, large, smooth and handsome.

This strikingly handsome breed of cattle is steadily increasing in favor, there being a good number of importations every year. In size they fully equal and often surpass the Short-Horns. Black and white are the only admissible *colors*, if that expression be allowable. The cows are great milkers, and it is for their dairy qualities that they are so much valued. The best come from Friesland and North Holland.

JOTTINGS FROM MY NOTE-BOOK.

CLINTON.

PUMPKINS FOR DAIRY STOCK.

THE wise man tells us that "There is nothing new under the sun." But, verily, the idea recently advanced by some that pumpkins, containing their seeds, are specially hurtful when fed to milch cows, is certainly new to me. From my earliest recollection, they were thus fed by my father, as they had been by his father before him; and I continued the same practice during the succession of years in which I was engaged in dairying, without ever dreaming of the risk we are now supposed to have run.

The practice was to collect a quantity of the pumpkins, as soon as the flush of fall feed began to diminish, and each evening, after milking, scatter them about on clean grass ground in some convenient place, breaking them up into pieces of convenient size for the cows to masticate freely, without a thought of any necessity for first removing the seeds. It strikes me as somewhat remarkable that if this new theory in regard to the injurious effect of the seeds on the cows, is correct, that I never discovered it in the course of more than forty years' opportunity for observation, and I flatter myself that I paid more than ordinary attention to all such matters, and I think I may safely say this without subjecting myself to the charge of egotism; and I will further say, that during the whole time that I was engaged in dairying, I never lost a single animal by disease, never had one affected by anything more serious than mere temporary illness, and never had a single case of abortion in my herd. During all this time, my cows were fed freely with pumpkins—seed and all—every fall, according to the supply.

It is not claimed that the pumpkin furnishes any great amount of nutriment, in proportion to its bulk, as we know it is composed largely of water. The same is true in a greater or less degree of the beet, the carrot, the turnip, and the cabbage, and yet we find them all to be valuable feed for dairy stock. That the pumpkin tends to increase the flow of milk, I have had ample evidence. Another advantage in the feeding is found after beginning to feed hay, in keeping up the color of the butter as well as its flavor, and in this respect it is only equaled by the carrot. Partly with these objects in view, the practice has been to gather the pumpkin crop prior to the coming on of hard frosts, store them under cover, and feed them out daily in the stalls. Should the weather become quite severe before the supply is exhausted, a covering of hay or straw may be used for further protection.

The diuretic property of the seeds of the pumpkin has long been believed in, and was formerly almost proverbial. But personal experience induces me to believe the idea was very much exaggerated. When the country was new, fruit was far less abundant than at present, and to make up for the deficiency, it was customary each fall, to dry large quantities of pumpkins for future use. My father's family was not an exception to others in this usage. While a boy, it was part of my duties to assist in the preliminary preparations for this drying, and an important perquisite to me was the privilege of saving as many of the seeds as I desired for my own future use. After drying them carefully, I stored them away as carefully, for that purpose, and used them as frequently and as freely at any and at all times, as I desired, without experiencing the least injury or inconvenience to myself. Indeed, I used them as freely as peanuts (then unknown to us) or other nuts are used by

children at the present day. Hence I am induced to believe that the *scare* about their injurious effects is all "moonshine."

The Poultry Yard.

THE BRAHMA FOWL.

JOSEPH WALLACE.

I HAVE no desire to enter into, much less to continue a controversy on the Brahma or any other breed of fowls, unless it tends to throw some new light on the subject at issue. I am not seeking notoriety through the press as being the first one in this country or in Europe, who has questioned the native land of this mysterious fowl. I wish from my heart that I could give my country priority, and pre-eminence in every thing that is noble and useful, but as this subject is one of great interest to poultry breeders, I must forego my wishes for the present, and try if I can remove the veil which shrouds the origin of the Brahma breed. I feel the impropriety of occupying too much space in these columns, and as it is impossible to be explicit in every detail, I have to confine myself to general remarks without being able to give the full texts of the authors whom I quote.

In the RURAL of December 29th, I said, "The Rev. JEAN B. PROULZ, in his book of "Travels through India, Siam, and China," accurately describes the domestic fowls of these countries, especially the Brahma which he admired above all others. Now, when I said *accurately*, I meant the word in its widest sense—as clear and concise a description as any breeder of this fowl could give in general terms without the "Standard' as a guide. I am satisfied that when a person describes every part, point, and feature of a particular breed of domestic fowls, I know, or at least I fancy I know, that he is not describing an ostrich, or a condor. It is true, he did not call the fowl Brahma, or give them any specific name. But not so with Dr. HASTINGS, who was well posted in such matters as I inferred from his introductory remarks on poultry. He called the fowl he particularized "Light Hindoo" and says: "They were bred with great care and exhibited by the vaisyas (merchants) in fancy *yum sulas*, (sandal wood coops). Some of the native breeders select places where the fowl can have free access to granite or white sand, with the view of giving their plumage a whiter appearance. Pure white fowls though sometimes seen, are very rare in India. Some castes worship them as the Birmins do the white elephant."

Mr. MINER claims that the United States is the "fountain-head" of the Brahma breed. He has not advanced a point to show that they do not exist outside of this country only by *negation*. Indeed, he says "poultry breeders have earnestly sought to ascertain their native land but in vain." Pray, who were the breeders who sought to find out their native land?" I venture to assert that many of the breeders he classifies as such, never left their native States in search of the much desired information.

Doubtless ere this, thousands of the RURAL readers have asked themselves the conundrum, "How were the first pair bred?" "Were they adult fowls when they came to New York. "They must have originated from a pair of the same breed, &c." Now, it is a philosophical axiom, "that like produces like," and if this is a fundamental law of nature, certainly Mr. CHAMBERLIN'S pair must have come from Asiatic fowl of the same or a similar kind; surely they were not bred from the pelican or the fabled roc, and most assuredly, Mr. MINER is a disbeliever in mythology, and would not venture to assert that they had sprung from the brain of some pre-historic mammalia. However, is it not reasonable to suppose that the Brahma had a pedigree like other breeds? And if they were the result of a cross, doubtless their original breeders would have taken advantage of the "cross," and produce "chips from the old block."

From my own personal knowledge of fowl breeding, having had over thirty years' experience; having bred most of the varieties now known in this country, and some which are not generally known to our poulterers; from observations during travel in foreign lands; chit-chat with East India seamen, and soldiers—and the familiar descriptions which came from the lips of my venerable father (who was well posted in poultry and who spent many years in India, and the adjacent islands,) I am led to believe that American poultrymen too fondly hug the delusion that the Brahma originated with them.

Mr. MINER thinks that Captain STUART had no pure bred Brahmas in 1846, because it was not heralded throughout Christendom. STUART had a pair of Asiatic fowl as pure, as true to color and markings as any Light Brahmas of the United States prior to 1852. They were known by the name "Light Indo," and at the time they did not cause much curiosity, as the Gray Shanghæ and Malay breeds were in advance of them, some two years. Moreover, Sea Mount was an isolated country-seat near the Atlantic coast—away from public travel, and at a distance from a newspaper office. The Captain too was an invalid and, no doubt, could not bestow proper attention on his fowls, and if his intentions were to breed exclusively from his "Indo" fowl, he was unfortunately disappointed, for the cock was maimed by one of his ferrets, so as to render him useless.

Sir RICHARD raised the first year some nice "Dark Indo" fowl, but after a while they got mixed in with his Malays, and they lost most of their distinctive characteristics. But Mr. MINER says that "the Dark Brahmas originated with Mr. BURNHAM of Roxbury, Mass., and that there were no Dark Brahmas known before 1856." For the present I concede Mr. BURNHAM'S claim as the first *American breeder* who produced Dark Brahmas. But I respectfully enter my solemn protest against his claim as being the original breeder of them. With all due respect to Mr. BURNHAM, of Melrose, Mass., I aver that there are scores of breeders throughout Asia, who could teach him or any of our "fanciers" a lesson in cross-breeding, and in breeding to color. It is questionable if Mr. MINER doubts that a people who have known and practiced artificial incubation, cramming, &c., for upwards of two thousand years, and who have bred and domesticated all the beautiful varieties we now have, from the wild *Gallus Bankiva*, to the meek-eyed, giant Brahma, can yet be ignorant of the method of producing a change of plumage without relatively changing the breed.

Mr. MINER seems to have not much faith in the authorities I cited. He says, "French clergymen, and British army officers, are not supposed to be good judges of any breed of poultry." This may be true in general, but there are exceptional cases. I consider them reliable, and evidently better informed on Asiatic breeds than most travelers. PROULZ held the professorship of Natural History for several years, until his health compelled him to travel abroad, and Hastings' learned disquisitions on poultry, prove that he was "master of the situation."

I regret that the works of these gentlemen are not in my possession. If they were I should send them to Mr. MINER with pleasure and without pay. PROULZ'S Travels was purchased some sixty years ago by my father at Brussels, and Hastings' book I bought in Liverpool, in the spring of 1847. I prized these books, not alone for their remarkable descriptions of Asiatic poultry, but also for their graphic accounts of the habits, customs, and religious rites of the Indo-Chinese race. I lost them, or at least had to abandon them with other things at "Limkins' Mills," some ten miles from Holly Springs, Miss., in the winter of 1862.

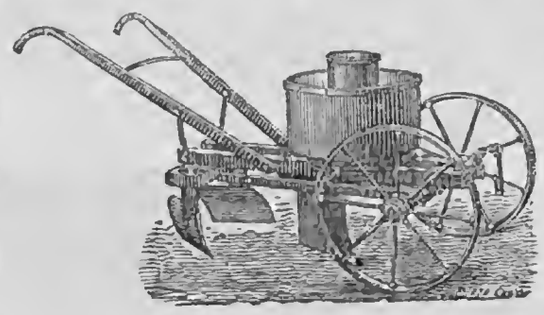
Industrial Implements.

TRUE'S POTATO PLANTER.

A POTATO planter that has been growing steadily in favor of late, is used for illustration in our columns of the present issue. It may be briefly described as an iron cylinder, which works as a hopper, resting on a frame. The bottom plate of this cylinder is made to revolve by the wheels acting on cogs. The plow under the hopper, opens a furrow, into which the seed is dropped, and the coverers following, effectually cover it in. The plow may be made to work at various depths, the coverers may be adjusted to work in unison. The drive wheels are constructed to work independently of each other, if thought desirable, and by means of a lever convenient to the operator's hand, the machine is thrown in or out of gear.

The important feature is the cylinder first mentioned. Into this are thrown the potatoes; about a bushel. They fall onto a revolving bottom which is indented with what are termed "seed boxes," and these boxes pass in rotation over the knife. The knife is fixed, and so placed relatively to the seed box, that the potato once in the box remains there until completely sliced and dropped into the furrow. The potatoes are cut somewhat like a wedge, that is, one end is thicker than the other. This is thought to be of advantage by some. The back part of the plow is open, and the operator has the satisfaction of seeing each piece drop, besides keeping constantly in view the length of furrow from the plow to the coverers. This advantage insures precision of planting, and is moreover, we believe, a feature peculiar to this implement.

Gauge-rings exactly fitting the seed-boxes are supplied for modifying the amount of seed sown, or to regulate the even distribution when different sized tubers are used. The seed, by this neat device, may be planted nine, eighteen or thirty-six inches apart in the rows. The fertilizer attachment that accompanies each machine, enables the farmer to use any dry, concentrated fertilizer that may be thought desirable. This attachment gauges the discharge, and is also supplied with an agitator to prevent clogging. Finally the machine is made in the best manner and is sold with a warranty.



Prejudice exists against preparing potatoes for planting in any other than the old way. Farmers seem to take a subjective view of the "eye" and become influenced by surface considerations. It has been shown by repeated tests with TRUE'S PLANTER that slice potatoes, not only are effective, but actually strike oftener than hand cut potatoes. The yield per acre is always satisfactory when the season is propitious, and in cases of severe drought, the machine-planted seeds have proved the hardier growers. This is accounted for probably by the fact that the seed going into the ground charged with moisture has that great advantage over a hand-treated potato that has most likely dried out by manipulating processes.

The advantage of a machine over hand planting in time is too obvious for reference; also its superior exactitude.

One man with his horse can cut and plant six acres per day under ordinary circumstances, and the manufacturers of the machine Messrs. NASH & BROS., 7 College Place, New York city, in their warranty, grant the privilege of planting five bushels before purchasing, as a test of the quality of its work.

Perhaps we cannot do better than insert an extract from a correspondent, Mr. J. D. RUE, Dutch Neck, N. J., who is a most conservative man and excellent farmer. It was some time before he cared even to try mechanical appliances for planting his large potato crop, but he eventually used a True Planter. He writes: "I was very much pleased with the manner in which it (the planter), did its work in every particular. I consider the yield equally good when the Planter was used, as when planted by hand. If there is any difference it is in favor of the Planter. I gave each a fair trial, planting alternate strips through my field of eight rows each, and measured the potatoes at digging time. I planted Peachblows, Peerless and Early Rose. The land was heavily manured with common barn-yard manure, plowed under." We think this a very thorough test. The Planter may be seen in New York, or the manufacturers will send all required information on application.

THE DAVIS SEWING MACHINE COMPANY, Watertown, N. Y., is extending its business with astonishing rapidity. The plans and specifications for additions to the main buildings embrace two wings, 40x105 and 20x32. With increased facilities and steam-power, the company will be in a position to meet the growing demand for this very popular sewing-machine. The merits of the Davis are too pronounced to need praise, and as the machine combines entirely new features, it would be well worth the while of our readers to see their circular.

Miscellaneous.

TESTING SEEDS OF GRASSES AND CLOVERS.

PROFESSOR W. J. BEAL.

THIS is delicate ground to tread upon, because it hurts somebody. Those who have bought seeds have been quietly (?) submitting, without a word; at least, many have bought poor seeds without finding fault. Buyers of seeds have some rights which should be respected.

A letter from a New York seed dealer thanks me for my previous article on testing seeds, desires me to test their seeds, and says, "The article will do legitimate, square, honest trade only good, and we thank you for it." The letter goes on to say that "the fault with your Western houses is, that every thing must be cheap or people will not buy it. Good seeds are worth good money. The commission box-trade in seeds in this country cannot compare in quality with the goods of regular seed houses."

In reading what follows, the author of the above quotation will see that the selling of poor seeds is not confined to Western houses which sell some seeds on commission.

A letter from another Eastern seed dealer thinks the article one of great interest, and says I have made "an important omission and, in justice to the seed trade and the public, it ought to be stated that the seeds tested were seeds sold on commission by grocers in the country." I hasten to make any and all amends necessary in this respect. I supposed that buyers and dealers generally knew how this business was done. It is commonly understood in our section of country, by buyers and sellers, that the grocers sell these seeds on commission. The boxes are taken around early in spring and picked up late in summer, probably to be overhauled and sent the rounds again and again, year after year. The second firm hopes I will continue the experiments and give some "reliable houses a trial."

I had but a limited time to devote to the subject, and began where I had the greatest suspicions of finding poor seeds. I intend, the coming season, to go quite largely into this testing business. At the Michigan Agricultural College we have tried many firms, East and West, and thought we knew of some which ranked high.

The past season I purchased directly of one of these reliable seed dealers, East, in New York, small lots of all the kinds of grasses and clovers which they could furnish. The name of the firm I will omit for the present. The seeds were tested in the green-house with great care. They were placed between folds of coarse woolen paper, and kept moist in a temperature of 56° to 70° Fahrenheit. At two different times, two lots of seeds were counted out, with fifty seeds in each lot. They germinated as follows:

Large Red Clover	41 43 47 46	total 177,	or 88.5	per ct.
Medium Clover	46 39 48 43	" 176,	" 88,	"
Bokhara Clover	35 28 15 18	" 96,	" 48,	"
Italian Clover	42 48 37 28	" 165,	" 82.5	"
Lucerne	37 39 38 35	" 149,	" 74.5	"
White Clover	44 42 42 40	" 168,	" 84.	"
Alsike Clover	40 37 30 22	" 129,	" 61.5	"

If good, the above should have averaged over 90 per cent. of growing seeds. About 95 per cent. would be what might be expected of fresh seeds. The above averaged a trifle over 75 per cent., if I have figured correctly. Our gardener feared we had not tested the seeds fairly. He tried seeds from the same lots, by placing them on sand kept moist by placing the pans in shallow water. Glass was placed over the pans (with some ventilation), which were kept at 50° to 65°. The result in this case was, that a trifle over 72 per cent. germinated.

I made similar tests of twenty-two species of grass seeds. The tests were more extensive than in the previous cases. At first we were not particular to take each from the chaff, so as to know that we had as many seeds as there appeared to be.

I have saved seeds of many kinds of grasses grown on the college grounds. Two years ago last summer I saved some, and three years ago I saved some. They have been tumbled about and kept in four different places, some of the time in a damp basement. I did not suppose they were good seeds, but they were the best I had on hand. With such seeds I have tried some of those taken from the lot above used, giving each the same chance. To be sure of the seeds, I shelled out a lot of fifty each with my own hands and eyes, assisted by a stage microscope.

		Grew.	Pr ct.
Schrœder's Bromus,	Eastern seeds	32	64
" "	Old College seeds	48	96
Sheep's Fescue,	Eastern seeds	0	0
" "	Old College seeds	36	72
Ky. Blue Grass,	Eastern seeds	3	6
" "	Old College seeds	14	28
Rye Grass,	Eastern seeds	9	18
" "	Old College seeds	37	74
Meadow Fescue,	Eastern seeds	3	6
" "	Old College seeds	46	92
Orchard Grass,	Eastern seeds	33	66
" "	Old College seeds	41	82

It will be seen that in every case the old college seeds spoken of were much the best. On the average, 74 per cent. germinated, while of the Eastern seeds only 26⅔ per cent. germinated. Remember that weak, old seeds produce weak plants.

Perhaps these tests of grass seeds will set some people to thinking. They may have wondered why they did not find all the varieties in the lawn where the seeds were sown. Kentucky Blue Grass or June Grass is ever present in our soil, and ready to grow and spread rapidly. It is our best lawn grass, and by its rapid growth has soon covered the land, and doubtless also covered up the deception of some seed dealers.

Agricultural College Seminary, Mich.

NATIONAL AGRICULTURAL CONGRESS.

THE National Agricultural Congress, which originated in 1841, and was then known as the Agricultural Society of the United States, and which was subsequently reorganized in 1857, and then resuscitated in 1870, convened in Washington, D. C., Feb. 18, 1878. The Society has held annual meetings since 1870 in various parts of the United States, and its members are composed of persons interested in agriculture and agricultural education, residing in nearly every State and Territory. Delegates were present from nearly all of the States and several of the Territories. Mr. W. C. FLAGG, the President for three years past, being detained at home by illness, provided an interesting address, which was read before the Congress. The address contained a brief sketch of agricultural societies which had been organized in this country, other than

of a local and State character, and recommended, among other things, that a committee be appointed to confer with the Agricultural Department, to see if a memoir of the history of the agriculture of this country had been prepared, in accordance with the request of the Minister of Agriculture of France, to be presented at the "World's Fair," to be held at Paris, in 1878. Committees on credentials and on business were appointed. At the evening session the following resolution was introduced by Col. BEVERLY of Virginia, and after a lengthy discussion was unanimously adopted:

Resolved, That, recognizing the substantial benefits already conferred by the act of Congress to encourage the agricultural or mechanical arts, passed in 1862, this body would respectfully urge upon the United States Congress the expediency of supplying such additional endowment as is necessary to the better carrying out of the objects for which this act was passed; and would further recommend to the said Congress of the United States that, in case the proceeds of the sale of the public lands be devoted, as proposed, to the education of the people, not less than one-fourth of the said proceeds be assigned to the further endowment of the agricultural and mechanical colleges organized under the grant of 1862.

Messrs. BEVERLY of Va., PURNELL of Del., and FIELDS of Wis., were appointed a committee to present this resolution to Congress.

It was also

Resolved, That this Congress congratulates the agriculturists of the country upon the fact that experiment stations have been established in several of the States, and earnestly recommends their establishment in other States, as insuring a practical education for farmers."

The following resolution was referred to the committee on business:

Resolved, That this body does not indorse any further distribution of the public lands to railroad corporations.

W. P. ADAIR, from the Chorokee nation, by request, made a very interesting address, showing great progress in agriculture and the various branches of education, stating that they had eighty-two free schools.

The business committee, consisting of J. R. DODGE, E. WHITMAN, B. M. FROBEL, W. G. MARKHAM and Col. F. D. CURTIS, reported subjects for the consideration of the Congress, for Wednesday, to be Agricultural Education, Inland Transportation, Sheep Husbandry and Wool Growing. This completed the first day's session. The meeting promises to be one of interest, one feature of which—and not the least important—is the interchange of sentiments and friendly greetings between the farmers and those interested in the calling, from remote sections of our country. D. C. F.

NEW JERSEY STATE HORT. SOCIETY.

THE third annual meeting of this society was held in the city of New Brunswick, Feb. 6th and 7th, with a large attendance.

The following officers were elected for the current year: President—Geo. Such, South Amboy; Vice-Presidents—John S. Collins, Moorestown; Alex. Barclay, Newark; C. W. Idell, Hoboken; Edwin Allen, New Brunswick; J. Van Deventer, Princeton; J. Nan Doren, Manalapan; B. F. Errington, Whiting; H. E. Chitty, Paterson; D. C. Voorhees, Blawenburg; E. P. Boebe, Elizabeth; E. S. Carman, River Edge. Rec. Secretary—E. Williams, Montclair. Cor. Secretary—B. B. Hance, Red Bank. Treasurer—W H. Goldsmith, Newark. Executive Committee—P. T. Quinn, Newark; E. Roberts, Fellowship; John S. Collins, Moorestown; D. McLaury, New Brunswick; D. C. Voorhees, Blawenberg. Fruit Committee, B. B. Hance, Red Bank; Wm. Parry, Cinnaminson; D. McLaury, New Brunswick; C. W. Idell, Hoboken, J. M. White, New Brunswick. Flower Committee—John T. Lovett, Red Bank: Jas. Taplin, South Amboy; E. S. Carman, River Edge. Vegetable Committee—W. H. Goldsmith, Newark; C. W. Thompson, Stelton; Benj. L. Trafford, Red Bank. The exhibition comprised twenty-two plates of apples, nine of pears, seven of native nuts, one of Florida oranges, and plants and cut flowers in good supply. An invitation from the Burlington Co. Ag. Society to hold an exhibition under their auspices at the time of their annual fair in October, at Mt. Holly, was received and accepted.

The next annual meeting will be held at New Brunswick. W.

THE N. Y. LIFE INSURANCE CO.

NOTHING creates so disastrous a panic in confidence as the loss of faith in things in which we were accustomed to place a blind reliance. Unsound assurance associations took advantage of this confidence and battened on it until the eventual wreck of matter opened the eyes and depleted the pockets of the victims. The reaction was and is as unreasoning as the former state of fancied security. The fact is, the public are too prone to rely on unsupported statements. A little original investigation would save a world of misery and induce a healthy discrimination in favor of sound companies, that would quickly solve insurance doubts by the annihilation of weak corporations. Indeed, such action would be but simple justice to all concerned. That people are beginning to take this view is clear by the statement of the N. Y. Life Insurance Company, printed elsewhere in our columns.

The amount of insurance in force in the Company at the end of the year was nearly one hundred and twenty-eight millions of dollars, and this was over one hundred and fifty thousand dollars greater than it was at the beginning of the year. The number of insurers has also increased very nearly two hundred, or until the total number of policies in force at the end of the year was 45,605. This handsome increase of business in the face of the times and of the circumstances is certainly worthy of commendation.

There are any quantity of good and interesting things to be learned from this thirty-third annual statement. The Company secured enough interest from its investments to pay its losses and it is not often a Life Insurance Company can do that. It paid claims to some six hundred families. It paid a better dividend than it did the previous year, and yet it marked down the value of its Government securities and its real estate a half million dollars. And then it left itself with a surplus, by the New York standard, of over six millions dollars; and that was one dollar extra for each one dollar of liability. The list of the Company's assets needs only to be examined. The assets of the New York Life amount to $34,957,250 96. If is enough to say of these assets that they are worth fully what is claimed for them, and that, if they were reduced by the sum of six million dollars, the Company would still be fully solvent.

For thirty-three years this Company has marked its ever-increasing prosperity by the most rigid fair-dealing, and the result is the handsome exhibit of its flourishing condition.

KALMIA LATIFOLIA.—(See page 134.)

The Garden.

WHAT VEGETABLES TO PLANT.

WHO, after looking through the long lists of vegetables offered by different seed-houses, is not bewildered to know which of the several varieties he requires? The various descriptions written about such, generally tend to make you believe they are all the best and all really necessary for the formation of a respectable vegetable-garden. Novelties in the way of Potatoes, Cabbages, Radishes etc., appear in the catalogues year after year, possessing unheard of excellent qualities. In fact, the advantages to be gained by making use of these novelties are so beautifully portrayed, that either through curiosity, or else fully believing all that is written about hem, one is led to experiment with certain kinds, while other, older and perhaps better varieties are allowed to fall into the background. I do not wish to imply by this that all such novelties are of but little account, or that all old sorts are the best; but, in order to aid some persons in their selection, I would mention the names of a few varieties known to be good and reliable through actual experience. My remarks will be confined more closely to the earlier sorts of vegetables, such being generally more desirable for those wishing to plant a garden the products of which are to be used during the summer.

DWARF OR BUSH BEANS.—Of the twenty-five varieties found in Seedsmen's catalogues, I find the "Yellow-podded Black Wax" the earliest of them all, and it is certainly surpassed by none in richness of flavor.

POLE BEANS.—Among these used as Snaps or String Beans, the "Speckled Cranberry" is the earliest and, to my taste, the best. The "French Asparagus" might also be mentioned as being very rich and delicate. Of Shell Beans few if any take precedence before the "Large White Lima," though the "White Dutch Runner" is a famous old-fashioned earlier sort, and very nice-flavored.

BEETS.—The earliest and prettiest is the "Egyptian" though inferior in quality. The sweetest is the old "Bassano," whilst for general winter use, the "Blood Turnip," if of a good strain, is the best. Beets to be used during the summer should be pulled when half grown.

CABBAGES.—For family use, the best early varieties are the "Little Pixie" and the "Dwarf Savoy." The best winter varieties are the "Drumhead Savoy" and the "Large Flat Dutch."

CARROTS.—The earliest, and best early sorts are the "French Short Early Forcing," and the "Half Long Carenton."

CAULIFLOWER.—The variety to be recommended for frames or forcing is the "Extra Early Dwarf Erfurt." For general use in this climate the kinds most certain to head are the "Algiers" and "Thorburn's Nonpareil."

CELERY.—"Dwarf Crystal White" and "Giant White Solid" are my favorites. Both are perfectly solid and of unsurpassed flavor.

CORN SALAD—is one of the most useful vegetables used for salad. Should be in every garden. If sown in August, it will be ready for use in October, and from that time, will retain its fine green color and excellent eating qualities till Christmas. Being very hardy, in mild winters, like the present, one may have it every day on the table direct from the garden.

CORN.—Among the many varieties of sweet-corn, none can be better for an early crop than the "Minnesota." This may be succeeded later in the season by the "Early Eight Rowed." For general and late use "Stowell's Evergreen" is the best.

CUCUMBERS.—The "Improved White Spine" takes precedence before them all for general table use. For pickling the "Green Prolific" is most desirable.

EGG-PLANT.—The only really desirable variety of this vegetable is the "New York Purple." The "Early Dwarf Purple" has the merit of being early, but is too small and delicate to become a standard sort.

ENDIVE.—If selected from good stocks, the "Green Curled" is the most desirable for autumn and winter use, being the hardiest and most tender after blanching.

KOHLRABI.—A vegetable cultivated by far too little. Boiled and served with sauce, like Cauliflower, it is delicious. The "Early White Vienna" appears to answer best in our climate.

LETTUCE.—For forcing the "White Forcing Head" and "Tennisball" or "Boston Head" are the best. The "Simpson" and "All-The-Year-Round" are old and reliable varieties for out-door, spring and summer use.

MELONS.—Among Musk-melons the "White Japan" is certainly the best and earliest. It may be succeeded somewhat later by "Sill's Hybrid" and the "Valparaiso." The finest Water-melon is undoubtedly the "Southern Rattlesnake." The sole objection to this variety is its lateness in ripening.

ONIONS.—The "Queen" being very early and tender is excelled by none. The "Large Red Wethersfield" and "White Portugal" are best for main crops.

PEAS.—Among the dwarf varieties, or those requiring no brush, "The Little Gem" still reigns supreme. "Blue Peter" is also very productive. Of the tall, wrinkled kinds, "Alpha" is the earliest, and the "Advancer" second. For a general crop, the "Champion of England" has few, if any, competition.

POTATOES.—The new "Beauty of Hebron" is the earliest variety which has yet come under my notice. The quality is also very fine. For winter use, I have found no sort superior to "Thorburn's Late Rose."

RADISHES.—For forcing and early spring sowing the "French Breakfast" is the first to be recommended. The "Yellow Summer Turnip" is excellent for summer use, and the "Scarlet Chinese" for winter.

SPINACH.—The new "Large Viroflay" is the best variety for this locality. For more northern situations, the "Prickly," being very hardy, is to be recommended.

SQUASHES.—In my experience, for summer use the "Summer Crookneck" has proved the best. For winter either the "Yokahama" or "Hubbard" should be planted.

TOMATOES.—The "Conqueror" is certainly the earliest variety; but for general use the "Hathaway Excelsior" and "Trophy" are to be recommended. This latter is probably the most desirable for eating raw, but perhaps a little too acid when cooked. X.

New York.

HOT-BEDS.

S. RUFUS MASON.

THE old way of having glazed sash for hot-beds is fast becoming obsolete. I have discarded glass entirely; it is expensive at first, costly to repair, and either freezes or scalds the plants when they touch it, as the temperature is low or high. My sashes have never cost less than $4.00 each, 3 feet by 6 feet—and average fifty cents per annum for repairs. Three years experience with muslin sashes where the thermometer ranges from 20° below zero to 70° above, satisfies me of their superiority. I make a square frame of 1½ inch stuff with a single bar of same size down the middle, cover it with common, heavy, unbleached muslin, paint it over, two coats, with boiled linseed oil and find it far better than glass. Have had no freezing or scalding, but better colored plants, more stocky, and better able to withstand early transplanting. After the hot-bed is filled with manure, level in the soil so as to come within three inches of the muslin, sloping exactly as it does. As the season advances, the bed will settle about as fast as the growth of the plants require it. This plan prevents the plants from becoming long-legged, which is the main cause of the slow after-growth, and in the cabbage family, of so many plants failing to make solid heads.

Muslin sashes 3 feet by 6 feet, cost not over 75 cents each, and will last five years, when 40 cents for new muslin and oil will make them new again.

Dodge Co., Neb.

THE ACME TOMATO.—Seeing the RURAL'S notice of the Acme Tomate, I wish to add my testimony in its favor. I grew it last season in different parts of my grounds, and I found it equally fine in all. Your description of it is very correct. It certainly is an acquisition, combining all the good qualities of the Tomato—smooth, solid, ripens well, bears constantly, and is of good size and excellent flavor.

J. G. R. KALE.

Loudon Co., Va.

CATALOGUES, &c., RECEIVED.

E. A. REEVES, 58 Courtlandt Street, N. Y., Illustrated, Descriptive Catalogue of choice seeds, embracing all the best varieties of American and European growth. Vegetable, flower, field, fruit, herb, tree, shrub and bird seed—also garden implements, etc.

Our readers are invited to send for this catalogue which contains over 100 pages.

THE GARDEN, published quarterly by BENJ. A. ELLIOTT & Co., 114 Market Street, Pittsburgh, Pa. A brilliant chromo of popular flowers for a frontispiece, excellent engravings, fine tinted paper and clear print, with practical floricultural articles characterize this first number of the Garden. If we understand it, this work is sent free to customers and to all others who buy seeds or articles to the amount of fifty cents. or more. Besides this, special premiums are offered for clubs. We think we may safely commend a consideration of the above to our readers.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

A PLACE FOR EVERYTHING.

"I HAVE heard of having a place for everything and everything in its place," said a friend whom I was visiting, to me one day, "but how that can be done in a closet like this, is more than I can imagine."

"Why?" I asked.

"Because it is the receptacle of almost everything that is in constant use, and there is so much in it that everything is in piles, and I cannot keep it in any other way."

Ah, I thought, Is not that the very secret? "I *cannot!*" Said closet opening off from the sitting-room was indeed the place for everything, and it so chanced that I was sent one day to that closet to get some article. Yes, it was small; about four feet by one and one-half, two shelves above, with nails for hanging articles under the lower shelf. There were from two to four garments on each nail—well that might do if each end and side had been appropriated to any particular kind—but there were pantaloons for Papa, also for Freddie, dresses for Mamma, skirts and aprons for both large and small, baby clothes of all kinds, &c., &c.

But the shelves, O, dear! they were filled to overflowing, and how? Why, with a mass that must be over-hauled for anything one wanted to get. Really my fingers tingled to take every article out of that closet, and while I preached them a sermon on order, put in practice what I preached by replacing them in order. The closet was but a specimen of some other corners in that house. And yet this friend of mine is one I value. She is really a good woman and in many things a close economist.

Perhaps some would call me notional, but there never seemed to me any reason why a closet should not be as well regulated as any other part of the house, even though crowded. Sheets seem to lie with so much greater ease in a pile by themselves, pillow-cases, ditto; with still another portion devoted to underclothes. Dresses should have their respective nails and skirts in order. Why not? Then when one wants any article she has but to turn in the one direction to get it. If we are to economize our time, this is one item of importance.

At a neighbor's, once upon a time, a certain pattern was wanted. Mother looked here and there, the girls searched closets and cupboards, up stairs and down, and meanwhile the thought came that I had heard before this family never knew where to find anything. As they were a large family, with a great deal of work to do, how much time might have been saved for their more necessary work by simply having "a place for everything and everything in its place!"

"Let all things be done decently and in order," says Holy Writ. It certainly takes no more time—and allow me to think not somuch—and very many times saves mortification and apologies. RAY HULBURT.

THE LAUNDRY.

AT the time of building a house, it adds but little to the expense to provide a room for washing-day and other days of disagreeable work. Allow me to describe a basement room of that kind, which is said to be a model. The cellar extends under the entire house, as all cellars should. A partition is set, making a square room in the rear. The chimney, built from the ground, gives a place for the stove-pipe of the small cooking stove to enter. The floor is cemented, so there is little danger from fire. The room has windows on two sides, thus giving plenty of light and air. There is an outside door, and easy steps to the clothes-yard; also an inner door, leading to the kitchen above, and a door to the main cellar, where there are bins of coal and wood. A pump brings water from an outside cistern—experience had taught the builder that cisterns under dwelling-houses ought never to be constructed. A zinc funnel carries the suds to the cess-pool and garden. The necessary furniture for such a room is of the simplest. Besides tubs and a bench to set them on when in use, there is a closet high enough to hang the skirt-board in, and wide enough for shelves on one side for the smoothing-irons, bluing box, cans of starch, and all the small articles needed. A good table for ironing, with clothes-frames and a chair, completes the furniture.

In winter, the ironing may be done in the upper kitchen, if saving fuel is a consideration. To make the laundry conveniences complete, it was thought best to finish the upper story of the wood-shed for a room to dry clothes in, when the weather was unfavorable, and it is a *real comfort*. There are three windows on each side, north and south, and when all are open the drying process is thorough and rapid.

It is to be hoped that the gentlemen readers of the RURAL, who contemplate building, will think favorably of an *especial* room for laundry purposes. It will prevent much annoyance to themselves and their families, which will fully compensate for the expense. M. G. R.

Lyons, Iowa.

DOMESTIC RECIPES.

I HAVE tried some of the recipes given in the columns devoted to the culinary art, and it occurred to me to send a few of my own "ways" in return. I wish the ladies would try my

Apple Turnovers.

Make a paste of sour milk or buttermilk with a little soda and salt, as for biscuits, except that more shortening is necessary. Rub the shortening into the flour and add the milk; then cut off a piece the size of a biscuit and roll out rather thin. Have ready dried apples stewed, sifted, sweetened and spiced to taste. Place a large spoonful on one half of the rolled paste and bring the other half over it, pinching the edges securely together. Fry in hot lard, turning them frequently to brown evenly. Also if you will make up your soda biscuits for tea in precisely the same fashion, and before putting into the oven wet the surface with milk, you will find it an agreeable variation from the usual way.

Cream Cake.

Two cups of sugar; one cup of sour cream with a small teaspoonful of soda; two eggs and flour enough to drop smoothly from the spoon.

Do the RURAL ladies know that if wheat pancakes, intended for breakfast, are stirred the night before as if for baking (except the soda) and left until morning, they will be more tender than just-made batter. In the morning add the soda and bake as usual.

LYDIA WOOD BALDWIN.

Cold-Slaw.

We make cold slaw of our cabbage as follows: cut very fine and pack in a small jar; sprinkle a little salt and pepper over it; take vinegar—a pint will answer for a small head; butter the size of a walnut; one spoonful of sugar or more if liked; heat this to the boiling point; mix a well beaten egg in a cup of cream and pour into the vinegar, stirring briskly until it again boils; then instantly pour it over the cabbage and cover tightly, pressing down with a little weight or plate. This slaw is better when two days old, although it can be eaten at once or after a week if kept in a cool place.

Flaky Pie Crust.

As some of our friends say that our pie crust cannot be excelled, I will tell you how I make it. It is to be supposed that every housewife knows how much or how little butter or lard she wishes in her crust. Cut the lard or butter into small bits, about the size of a thimble and stir, not rub, with a little salt into the flour; mix with cool water as quickly as possible and roll out. Cream, sweet or sour, makes a nice mixing for pie-crust, but does not make it flaky like the above.

Cracked Wheat.

This excellent dish is often spoiled by very good cooks who think they must stir it all the time to keep it from burning. Too much stirring makes it like paste; putting in more water when nearly done has the same effect. One-third of wheat, by measure, to two-thirds of water, soft, if you have it, will make it about right. The water should be cold when the wheat is put in; it should cook slowly and be covered closely. In this way scarcely any stirring will be found necessary. There is a deliciousness in this dish when cooked as above, which is never found if stirred while cooking. The same may be said of oatmeal, only the latter should be quickly stirred into *boiling* water; cover closely and let cook for about twenty minutes. Wheat may be cooked about the same time, although it bears cooking longer.

AUNT FLORA.

Egg Toast.

Beat four eggs; yelks and whites together thoroughly; put two tablespoonfuls of butter into a sauce-pan and melt slowly; then pour in the eggs and heat *without boiling* over a slow fire, stirring constantly; add a little salt and when hot, spread on slices of nicely-browned toast and serve at once.

To Fry Smelts.

Wash, cut off the fins, and dry with a cloth; melt a spoonful of butter and into it stir the beaten yelks of two eggs; salt and flour the smelts a little, dip into the egg and butter, roll in grated bread-crumbs and plunge into boiling fat; fry until of a bright, yellow brown; serve upon a napkin garnished with fried parsley.

To Fry Parsley.

This when done as it should be, is one of the nicest as well as cheapest of garnishings. The parsley should be washed and dried in a cloth; then if one is the happy possessor of a wire basket, put in the parsley and hold from two to three minutes in *boiling* drippings; take from the basket and dry until crisp before the kitchen fire. It may be fried without a basket but requires more care in so doing. E. M.

Everywhere.

NOTES FROM CALIFORNIA.

GRASS is knee high, and almonds are in blossom. The rainfall is very abundant, but a little monotonous. Fifteen inches have fallen during the past three weeks, well distributed over the State. This insures a mighty crop of wheat. Only those who endure the heat of the long, parching summer can bear with patience these tremendous storms of rain. We know how the ground requires a deep soaking to nourish the crops, when the skies, for months, are cloudless, and the growing grain must depend on searching with its rootlets for moisture.

There are short intervals of clearing weather, when the sunshine brightens the landscape, touching the mountains and the green fields with cheerful light, and we flatter ourselves the rains are over. But the southwest wind is treacherous while it holds. Ten minutes is time enough to hurry up the dispiriting drizzle out of a cloudless sky, and another ten minutes converts it into a deluge that roars, and splashes, and drifts horizontal sheets of rain through the tightest roofs. But we console ourselves with the thought that our floods are more endurable than the winter climate with you, where the thermometer is kept busy registering the fitful temperature of each twenty-four hours. Here it stands, without much variation, at about 50°.

FRUIT PROSPECTS.

As an example of the rapidity of vegetable growth, the writer's experience in planting three years ago may suffice. At that time it was determined to set an orchard by digging holes for two-year-old trees, three feet in width and depth. A bushel of bones was placed in the bottom of each hole for drainage, and to supply food for the roots in after years. The trees were firmly staked and tied. Clean cultivation was given, without which there is no success here. They have never been watered. The soil is black, gravelly loam; some of it approaches adobe. Branches grew three, five, ten feet the first year. A little fruit set, but was hardly permitted to bear. The second year a few apples, plums, almonds and peaches were borne. The third year, after severely thinning, peach trees yielded three pecks; Bartletts and Winter Nelis twenty pounds per tree; and almonds, nectarines, apricots and apples were quite a show. Only *slips* of grape vines were planted. One turned off twenty pounds of fruit the third year. We never have fears of a failure of the fruit crop. Sometimes a late frost thins it out—nothing more. The fact is, the unvarying yield of grapes, peaches, pears, plums, apricots, oranges, &c., &c., together with the mild climate, constitutes the main attraction California has to offer immigration.

RICH MINING STRIKE.

Last summer a resident of Bald Hill, near Auburn, made a snug fortune in three days. He was a prospecter, and, like most of the class, was wofully down at the heel, living from hand to mouth. One day, when hunting around over the hills, he struck his pick into a little mound, which looked like an ant hill, and to his great delight he unearthed some chunks of rotten quartz which contained traces of gold. He sunk on the ledge, and, at every stage of the descent, was rewarded by finding more gold. He procured help and took out fifteen hundred dollars' worth at thirty feet depth. Further down, the chimney, or ledge, became richer, yielding lumps of pure gold, and the interstices between the rocks were so rich that he began to wash it in a pan. The editor of the Placer Herald and Sheriff MCCORMICK visited the mine next day and found him with a pan of the glittering stuff, which washed out over a thousand dollars. Other pans were sent up which washed still more. The next day he took out $10,000, making $35,000 all told, when he accepted an offer of $20,000 for his claim and retired, saying it was money enough for him.

It is a good story, and is authentic. It goes to show that placer mining still pays in occasional big strikes. In fact, that kind of mining pays moderately all the while. At Gold Hill, Nevada, and Dutch Flat, where there are vast hydraulic appliances, acres of land are washed over every season. There are canals forty or fifty miles long supplying water. Iron pipes, from ten to thirty inches in diameter, with enormous pressure, discharge cataracts of water against gravel banks that melt away and run, in torrents of mud and water, through long channels, with riffle bars and quicksilver to catch the gold. This branch of gold mining paid about eighteen millions the past year.

PROSPECTS.

The population of this State increases slowly. Our remoteness is not the only reason for it. Routes of access are long and expensive. It costs about as much to travel as before the building of the railway. The fairest and best parts of the State were long ago gobbled up by land-grabbers, who hold immense tracts of land for a rise. A few of these monopolists have the State Government by the throat, and our taxes are the highest of any State in the Union. These would seem sufficient reasons for the stunted growth of the Commonwealth. There are still others. But we hope yet to rescue this coast from such domination. SPECS.

San Francisco, Feb. 7, 1878.

NOTES FROM TEXAS.

AFTER a very wet January, February came in with fine sunny days, rather a cool temperature ranging from fifty to seventy degrees, prevailing during day-time and falling so much during nights as to occasionally cause slight white frosts, not severe enough, however, to hurt anything in the garden. It is just the kind of weather we like here at this season of the year. Farmers have their plows agoing; gardeners are busy sowing and planting the more hardy vegetables. Strawberries kept on blooming since December, though they do not set fruit; the stamens and pistils get blackened by the frosts. By a little extra painstaking, giving them slight protection against occasional night frosts, we, no doubt, would be able to enjoy this luscious fruit during the greater part of the winter months. Our vegetable stalls are well supplied with all the hardy vegetables which had been started during the fall months. In flower-gardens violets are, and have been, in their full glory since October. Narcissii, Jonquils, Snowdrops, Leucojum vernum, etc., bloomed for some time; Hyacinths are beginning to do the same. Lilium longiflorum is sending up its flower-stalks; Cyclamen Persicum and Libonia floribunda stood unharmed a frost of six degrees below freezing. The first bush I noticed in full bloom, is Mahonia aquifolia; Forsythias and Spiræas follow suit. The Japan Medlar is developing its fruit; no frost, as yet, has been hard enough to destroy it. Planting trees, vines and flowers is the order of the day.

Of the Jerusalem Artichokes, the Long Purple and Round White, I received from RURAL Headquarters last year, the former took the lead, but, subsequently most of these plants succumbed to the hot season. The white ones came out later but stood their ground. On digging them I could find no perceptible difference between the tubers of those few plants of the purple kind that braved the season and the white ones. They all were white and roundish. Of their yield I am not prepared to give my judgment, since a brood of that pernicious little animal with so many different names such as gopher, salamander, ground-rat, mole (though I never have seen a genuine mole in Texas yet) found their way into the patch where they helped themselves to the best tubers.

Houston, Feb. 13. G. MARTI.

RURAL SPECIAL REPORTS.

OAKLAND, Douglas Co., Oregon, Feb. 5.

WE have had a very fine winter so far. Have had no snow or freezing weather, and only a few frosty nights. Vegetables, such as cabbage beets, lettuce and radishes, grow out in the garden all winter. Strawberries are in blossom now. Farmers have been plowing and sowing grain all winter. Grain brings a good price here: wheat, $1; barley, 75c.; oats, 50c.; potatoes, 75c.; hay, $10 per ton; apples, 50c.; butter, 37½c.; eggs, 25c. per dozen. Stock is cheap: horses, $25@125; good milch cows, $12@40; sheep, $1@2. Land is worth from $2.50@20 per acre. H. C. U.

WHITNEY'S POINT, N. Y., Feb. 18.

WEATHER mild and sleighing good. Wind in the N. N. W., but not very cold. Lumbermen very busy. Butter is selling here for 20@25c. per pound; eggs, 15c. per dozen; oats, 35c. per bushel; potatoes, 35c. per bushel; hay, $7@8 per ton; straw, $3 50@4 per ton. The ice crop is being harvested; the average thickness is from ten to twelve inches. M. B. D.

WOOD CO., Ohio, Feb. 19th, 1878.

WE have had a very mild winter hereabouts: no snow until February. We have had two heavy storms this month. Stock is doing well, feed is abundant and cheap. Indeed all kinds stock are at a low figure. Wheat looks very well. Hay sells at $6 to $8 per ton; wheat, $1.15; corn, 35c; oats, 25c; potatoes 35c. H.

RURAL GROUNDS, Feb. 23.

FROST entirely out of the ground. Constant rain and high winds. Bottomless mud. Warm, muggy. A freshet is feared.

Miscellaneous.

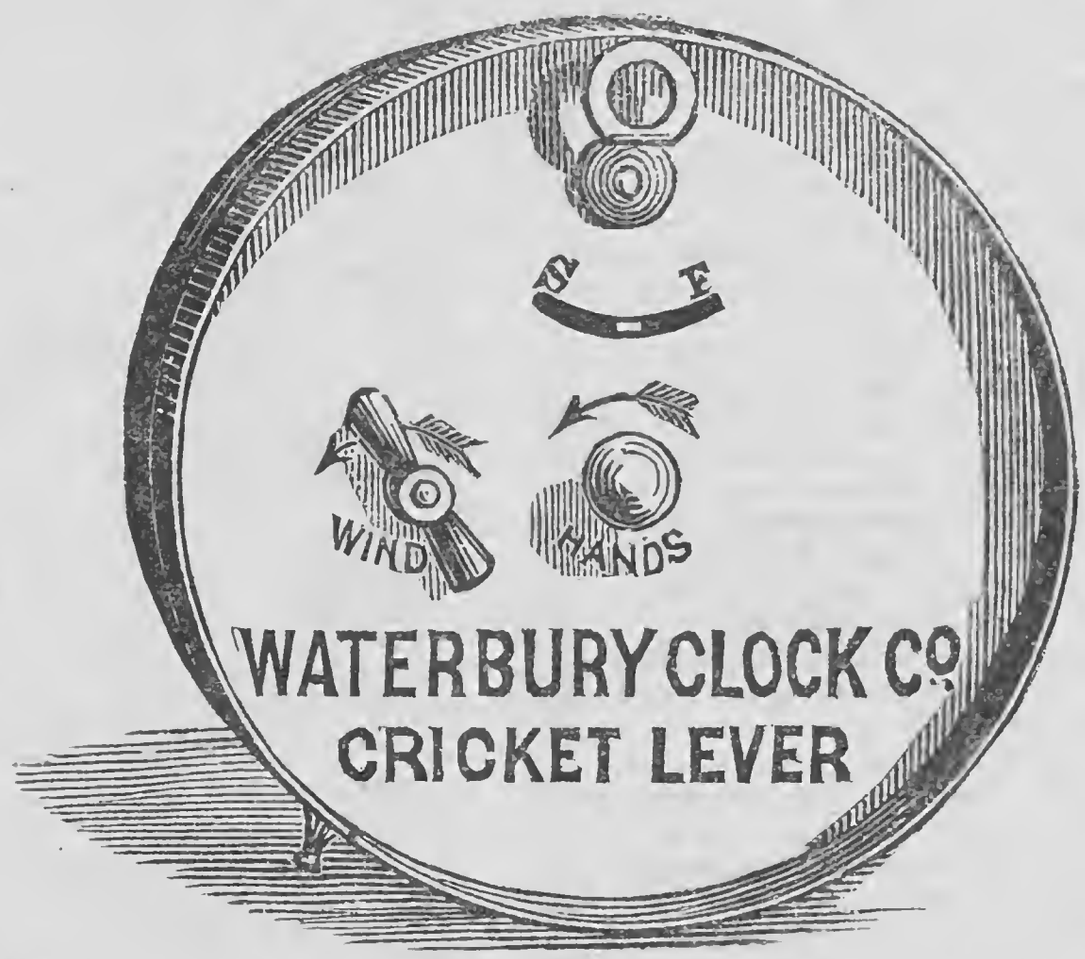
Pastes in boxes at 30 cts., 50 cts., and $1. Agents wanted. HENRY HALES, Proprietor, Ridgewood, N. J.

THE LATEST ANNOUNCEMENT

TO THE FRIENDS OF THE RURAL.

How They May Secure an Elegant Time-piece Without Cost and with very little Trouble.

THE OFFER ALL THAT IT IS MADE TO APPEAR AND MORE.



The Cricket for Two New Subscribers.

IT COMBINES THE BEST FEATURES OF BOTH CLOCK AND WATCH, And May be Carried from Place to Place in a Trunk or Valise.

Please return at our expense if disappointed, and we will promptly refund the money.

We want the Rural Cricket Clock in the Home of Every Subscriber.

THE MOST BRILLIANT OFFER MADE BY ANY JOURNAL.

In the next column may be seen an accurate portrait of the "Cricket" in so far as it can be presented in an engraving. The cut on this page is merely a photographic enlargement of the back, to show its actual size as nearly as our page permits. It is one inch larger in diameter.

ITS BEAUTY, COMPACTNESS,

elegance of form, depth and finish can not be shown by any engraving. It must be seen to be appreciated.

To judge by its appearance many who have not seen it before, estimate its value to be ten dollars.

We have been enabled, through the facilities afforded by our Experimental Farm (owned and operated exclusively for the benefit of RURAL readers) to make a FREE GIFT to our subscribers of a collection of rare and valuable flower seeds which have been enthusiastically received; and this gift on a still more liberal scale, *will be repeated during the present year*. Meantime, the RURAL itself has been enriched in all its departments, by the contributions from the best writers and life-like illustrations, demonstrating that our enterprise has not been at the expense of the paper.

This policy has been responded to by our patrons so liberally in subscriptions that we have decided, after a careful consideration, to make one more offer that shall

ECLIPSE EVERYTHING!

The "Rural Cricket" is inclosed in a beautiful circular metallic case of a single piece, and therefore without a seam, which is nickel-plated. The face of the clock is white and has a "second" dial as in watches. The works are securely inclosed so that no dust can penetrate and harm their movement. It is like a stem-winding watch, in that it requires.

NO KEY TO WIND IT!

and the hands are regulated without being touched. It runs thirty hours, is a chronometer-balance lever, jeweled, and it is guaranteed to keep as accurate time as the best watch.

IT RUNS IN ANY POSITION,

on its face, on its back, standing up, lying down, on its side, in short, in any position.

SIMPLICITY, ELEGANCE, DURABILITY.

Only after much negotiation with the world-renowned manufacturers, have we been enabled to offer our friends a present which exactly met our wishes and one which all will want, no matter if there are a dozen clocks in the house besides.

It may be secured without any more effort than is required to tell its merits to a friend or so, and a sample clock will enable anybody so inclined to dispose of hundreds in a week.

THE OFFER.

FIRST.

Two New Subscribers

secures the clock! The lowest price of the RURAL NEW YORKER, except in clubs, is $2.50. Therefore upon the receipt of $5 00 and two names the sender is entitled to ONE "RURAL CRICKET."

SECOND.

We will send the RURAL NEW YORKER for one year and the Cricket Clock to any one upon the receipt of $3.50.

RURAL NEW-YORKER, 78 Duane St., N. Y.

WHAT THEY SAY OF IT.

FIRST ACKNOWLEDGMENTS.

ALL THINK IT "SPLENDID."

TO THE FRIENDS OF THE RURAL.

WE issue this week a large, *extra* edition of the RURAL, to supply the great demand for sample copies; and we would be much obliged to our friends everywhere, if they will send to us for one, or more copies, to show to any person who they think will subscribe for it. A postal card is all that is necessary for application.

Hitherto, we have not made any very strong appeals to the patrons of the RURAL, but *now*, in view of our EXTREMELY LIBERAL OFFER of a new, unique, and really ELEGANT CLOCK to any one who sends us $5, (*two new subscribers* at $2 50 each) or $3 50 (the clock and one name), we call on our friends to do their best to aid us in still further extending the RURAL'S circulation.

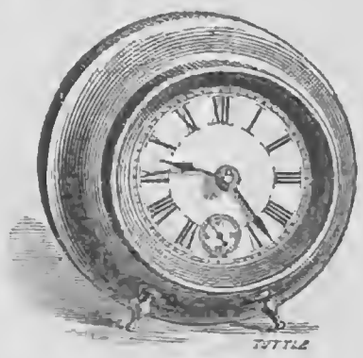
Let us, then, friends, hear from you *immediately*. Please not delay; as spring work will soon be upon you. We want 10,000 of our *present* subscribers to have one of our splendid time-pieces, to which their children, many years hence, will point with pride, exclaiming: "My father obtained this elegant clock for one evening's work in getting subscribers for the RURAL NEW YORKER. It runs as true as a *chronometer*, has had no repairs for twenty years, and now bids fair to last a half a century."

It is now our modest aim to render the RURAL NEW YORKER the greatest success known to Ruralistic journalism, and to force it by weight of *worth* into every family home that loves plant life.

The following are among the first acknowledgments we have received.

UNCLE TRUE:—I read all about what you said of the "Cricket" and thought I would try for one. I send you $5 and the names of my two uncles. They used to read our paper when we got through, but mother said she could not spare it any more, because she did not get a chance to look at the Fashions in the paper until they were two or three weeks old. I just had no trouble in getting these names. I hope the cousins will tell how they succeed. Please hurry up the clock. We are all anxious to see it. If I like it I may try for two more names and get a clock for my married sister. J. T. S.

Burns, N. Y., Feb. 21, 1878.



YOU request me to state frankly what I think of the RURAL "Cricket," and say that if I do not like it, I may return it at your expense and you will promptly refund the five dollars. We would not part with it on any account if it will keep good time, and we only wonder how you can afford to send it. A. Mc. C.

Richmond Hill, N. Y.

IF it is as good as it looks to be, I shall be perfectly satisfied. C. J.

Brooklyn, N. Y.

THE "Cricket Clock" received. All think it splendid. Will show it. It came safely, except one leg "dented in;" can be fixed. Many thanks. Am well suited in change made. Will do what I can. Respectfully, C. E. S.

Garden Prairie, Ill.

I WRITE for my son, (S. M. S.) to acknowledge the receipt of the clock with which he is well pleased. You will please accept our joint thanks for the same. M. J. S.

Auburn, N. Y.

THE RURAL "Cricket" chirps cheerfully, not on the hearth, but on the mantel-piece beside me; and its handsome presence is a constant reminder of a large reward for a small service. It needed only a merited commendation of the RURAL, confirmed by reference to the rich contents of the last issue, to secure the two subscriptions in return for which the "Cricket" has come to be a charm, an ornament and a convenience in our home. My little boy, the appearance of whose juvenile efforts in the Youth's Department of the RURAL, has more than once tickled him hugely, expects, before long, to secure a "Cricket" of his own for the room jointly occupied by himself and his little brother.

MRS. C. L. H.

Licking Co., Ohio, Feb. 20, 1878.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, MARCH 2, 1878.

We earnestly request that all letters containing money, or any communication intended for the BUSINESS DEPARTMENT *of the paper, be addressed to the Editor, the Publisher, or* THE RURAL NEW-YORKER, *and not to any individual. We cannot otherwise guarantee the prompt entry of names upon our books, or the acknowledgment of money.*

WE apologize to our readers that Questions and Answers are at the last moment for the most part, unavoidably crowded out. Even if placed in our practical pages, we promise to publish them next week.

SANE OR INSANE?

A CONSIDERABLE excitement has been caused in certain circles by the recent marriage of Mr. LORD to Mrs. HICKS, and in none more than in his family circle. His sons were particularly aggrieved, and immediately concluded that the old gentleman was insane. What is insanity, is not an easy question to answer; but they insisted that for a long time his acts and deeds had been such as to prove him positively insane; and the last and overwhelming proof, was the fact, that at his age he married. Now, there are undoubtedly differences of opinion on this head.

A little reprobate, being asked on the occasion of his first visit to Sunday School if he said his prayers night and morning, asking GOD to take care of him, replied he did at night, but he thought any smart boy ought to be able to take care of himself in the day! Now, many young men have married in order to have a wife to look after them, to sew on their buttons, mend their clothes, and do various things in which the skill and handicraft of women exceed those of men. We would not forget, either, that the gentle woman is a solace to pain, a comfort in time of trouble; and under favorable pecuniary circumstances, a young man is not usually thought insane who contracts matrimony; on the other hand, it is considered he acts the part of a very nice and entirely sane individual. A young man may be able to take care of himself, while an old one needs help.

If then a young man, hale and hearty, strong and able-bodied—in admirable condition to take care of himself so far as in a man lies so to do, is not only excused but commended for marrying, why not so much the more, should he be, who, past the three score years and ten, feeble in body, needing hourly assistance, liable at any time to be overcome by rheumatism, gout or any of the other ills that old age is heir to, needs the kindly care of a wife? Should the taking of one under such circumstances to be considered as an indication of insanity?

But the younger LORDS persisted in the assertion that their paternal ancestor was a lunatic, or at least an imbecile, or, call it by what ever name you will, a man unfitted to take care of his property, and called upon the courts to examine into the matter, sustain them in their assertion, and keep the poor old man from improperly disposing of his estate.

The courts however have been saved the necessity of interference. The children modified their assertions somewhat, and have seen signs of returning sanity and strength of mind in the old gentleman. He has executed such papers as will ensure to them the bulk of his property. This is satisfactory and the family jar is at an end.

Query.—If Mr. LORD, the elder, was not of sufficiently strong mind to manage his own affairs had he determined to give property to others, of how much value in the law should be these trust deeds be made, in favor of his children.

A VALUABLE EXPERIMENT.

MR. FRANCIS DARWIN, the worthy son of Mr. CHARLES DARWIN, has taken up the investigation of so-called carniverous plants, where his father left off. The latter showed, in the case of Drosera, that certain nitrogenous substances—such as bits of meat—induced an acid secretion from the cells of the leaves, which gradually dissolved them. This being established, the next inquiry has been, was the plant benefited thereby? an inquiry that Mr. FRANCIS DARWIN seems to have answered in the affirmative. The Gardeners' Chronicle says that about two hundred plants were grown by him in soup-plates filled with damp moss and divided by a partition. The plants on one side were artificially fed; those on the other were left alone. The experiments lasted from July till September, the plants being "fed" every two or three days during that period. Only a short time elapsed ere it became evident that the fed plants were benefited by the process. They became more hearty-looking, their green color was intensified, and "just as an animal lays on fat when fed under certain conditions, so did these Sundews lay on protoplasm, chlorophyl and starch." The following table, which Mr. F. DARWIN furnished the Gardener's Chronicle, gives the differences between the two sets of plants, and shows the results and the inferences to be derived therefrom:

Results of Experiments in Drosera.

	Unfed.	Fed.
Total weight of plants, excluding flower-stems	100	122
Total number of flower-stems	100	165
Sum of hights	100	109
Total weight	100	282
Total number of capsules	100	194
Av. number of seeds per capsule	100	123
Total number of seeds	100	242
Total weight of seeds	100	380

Here we have it proven that some plants at least absorb through their leaves not only liquids but also nitrogenous substances, and are benefited thereby. And this benefit is most marked in the seeds and stems. In such experiments the practical cultivator is indeed greatly concerned, and it is hard, in the light of such results, to deny the scientist his meed of praise and justice.

GET THE BEST.

THERE is no place where this bit of advice acted upon, is of more value than in the selection of tools and implements for the farm. A good ax, hoe, or plow, is cheaper at a high price, than a poor one would be at less than half the cost of its manufacture. With a good tool one can do much more work with less expenditure of force—which means muscle—than with a poor one, so it saves both ways. Beside, it serves a purpose as a moral agent. You will find much less ill temper and profanity on a farm where poor tools are discarded than on one where they are used. When the ordinary mortal is out of humor, whatever the cause, he is inclined to give vent to his feelings in some way, sometimes in actions, by a kick or a cuff as any dog or boy within his reach will be able to bear witness, sometimes by words, fretful, or scolding, or if he be given to profanity, (and sometimes when not) by an energetic expression, best used if at all when none are within hearing distance. Now all this, and more too, can be prevented by "Getting the best."

By the way, we wonder how many who see this bit of advice and direction so often found in the newspapers in connection with advertisements, know that it originated with O. S. FOWLER the Phrenologist. More than thirty years ago, in writing of Webster's—then comparatively new—Unabridged Dictionary, he advised the readers of his Phrenological Journal, not to be content with any other, but at whatever sacrifice to "Get the best."

THE SPREAD OF DISEASES.

THE relationship which the minute lower organisms bear to contagious diseases, opens up one of the most important subjects of inquiry known to modern science. The Gardener's Chronicle, in referring to the extraordinary range of temperature that Bacteria, for example, will bear in the germ state without injury, says that this discovery is of no little importance in relation to the diffusion of contagious diseases, which are now believed by many eminent men to be actually caused, and not merely accompanied by the presence of Bacteria. If this doctrine can be established, it is likely to lead to discoveries of incalculable benefit to the human race.

The theory of abiogenesis, or *spontaneous* generation, has been proven to be untenable. Now, it remains to discover some means to destroy the germs and avoid the conditions favorable to their development. "Just as the potato fungus is developed from minute resting-spores, and especially favored by certain climatic conditions, so are contagious diseases the result of similar though infinitely smaller parasitical organisms whose propagation is much more certain and rapid in ill-fed, dirty, and badly-housed individuals, than in those who are well-nourished and who breathe a pure air."

In this view of the case, "contagion" means simply a condition of the atmosphere favorable to the spread of these minute organisms, and hence it is that people who are perfectly healthy ofttimes suffer the same as those who are not. And no doubt that this is as true in vegetable as in animal life.

POLITICS FOR THE FARMERS.

IN many of the States, the election of township officers is soon to occur. Whether the election occur at this time or at any other time, whether it be for the election of town-officers or for county or State officers, the following remarks are equally applicable in all cases.

Good farmers are very likely to be much interested and industriously engaged in what immediately concerns their farms or their families. Busy with their own affairs, they often forget or neglect their duties to their country. When a dishonest or incompetent man is elected to an office, the farmer sometimes growls and thinks the country is all going to destruction. Who is more to blame, we should like to know, than the honest, industrious man who fails to take part in political affairs? We are not among those who think that politics should be entirely given over into the hands of professional wire-pullers. The man who fails to attend and encourage his best neighbor to attend the caucus, neglects an important duty. Whichever party he may work with, he should see to it that the best men are nominated for office and then he should assist in trying to elect them by all honorable means. Such a course, honestly pursued for some years, will be a great benefit to our country; it will lead to the abolishing of poor laws and the making of better. The time so spent will be a profitable investment.

SILVER AND GOLD.

AN ounce of silver is worth 54 pence sterling in London, equal to $1.09 gold. The proposed new silver dollar is to contain 412½ grains of silver, equal, at the above rate, to a trifle over 90 cents; and although the silver dollar will pay, in America, as much debt as the gold one, it will buy only nine-tenths as much in Europe, because there it is worth only its value in silver by weight. Consequently, our merchants will use the gold to pay their debts abroad and silver to pay those at home, for who would be so foolish as to send eleven hundred silver dollars to London to pay a debt that could be satisfied with a thousand gold ones, if at home the silver and gold dollars were equal in value?

How long the silver dollar will be worth 90 cents, depends much on how rapidly silver is mined in America. The quantity contained in the mountains of Nevada, Colorado, and New Mexico, is simply inexhaustible, and as it is brought to market, the tendency will be to reduce its commercial value. Should several millions of dollars' worth be used by our Government every month for coining, the probable result will be to increase the price somewhat at present. How much this has had to do with the passage of the Silver bill, politicians and financiers probably know better than we do.

NOTES.

Colorado Potato Beetle.—Probably there has never before been an insect so much talked about as the Colorado Potato Beetle; certainly no other has had so many portraits taken of it. Probably no other insect has advanced in a greater degree an appreciation of the science of Entomology, while more than one worthy entomologist has to thank this honest beetle for a notoriety which might else have been long deferred. The more we think of Doryphora, the more we are inclined to entertain for it—her—him, a certain amount of—not exactly esteem, nor yet respect—we will say, consideration.

A Card.—ED. RURAL NEW-YORKER: In my first seed-article I find some did not fully understand me. The seeds, as I stated, were those sold at the groceries, such as I suppose are carried about from year to year and sold on commission. I did not send direct to the firms for the seed. I began where I had greatest suspicion of fraud and I found it worse than I expected. Some firms have already again sent packages of seeds around to the groceries. I am going into this "Seed Business" heavily this spring, and with the help of fearless papers shall do what I can to drive worthless seeds out of our markets.—W. J. BEAL.

Question in Mathematics for the Commissioner of Agriculture.—If it costs twenty cents a pound to raise and prepare a certain kind of tea for market, where labor is five cents a day, how much will it cost where labor is fifty cents a day, and what percentage on his investment may the capitalist expect to realize who engages in tea culture as a business at the latter place, admitting that the soil and climate are as well adapted for the growth of the tea plant in one place as in the other?

The Enthusiasm which Horticulture Inspires.—"I pray," said a gentleman through whose youthful grounds we were walking a few days since, which had been laid out and planted under his own direction, "that we all" (his family) "may live at least another year to enjoy our home." We give the remark, to show to what extent a person may become interested in Horticulture. It is a truth that few pursuits add more to the real happiness of life.

BREVITIES.

CUT cions for grafting.

THE Northern Spy is the best apple now.

THE papers talk against Commissioner Le Duc just because he is a t-totaler.

A FRIEND remarks: "If I could have but one shrub, it would be Spiræa prunifolia. It has such a beautiful autumn foliage, and such glossy leaves."

THE hard times oblige the poor people to wear their dresses long. But this is the last reason in the world why rich people should follow in the same train.

"HE is a good man to work for." Mr. MINER says it is no compliment to a farmer's administrative ability to have this said of him by his farm-hands.

A FINE table-bird is produced by crossing an English male pheasant with game hens. The hybrids are plump birds with long, tapering tails, somewhat like those of the pheasant; the plumage is beautiful. These crosses are gamey and delicious eating.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

THE BABES IN THE WOOD.

Now, grandma! why don't you look jolly,
  Instead of that sorrowful way?
Don't you know Hal and I have been married
  Just a fortnight ago yesterday?

And we're perfectly happy, and will be;
  Folks need'nt be doleful, I know,
If they don't look for troubles and worries,
  And heartaches. My Hal thinks just so.

Now you're sighing! I know what you're saying:
  "The Babes in the Wood." But you see
That Hal's twenty-one in November,
  And I shall soon seventeen be.

And we've seen a great deal of the world, too,
  We know how to battle with life;
And Hal says, "There can be no sorrow
  When a man has a true little wife."

You've had lots of troubles and trials,
  But maybe we won't. Seems to me
You old folks bring sorrow by looking:
  There! you want to say, "Wait, and you'll see."

But you only look over your glasses,
  And clasp hands, as though you would pray,
And whisper, "God bless you, my children,
  And keep you in sunshine alway."

FIVE YEARS AFTER.

Grandma, won't you come out and help us?
  I'm worn out with watching and work,
For the children are sick, baby teething,
  And the cook (that old Biddy MacQuirk)

Went away in a huff, without warning,
  And I cannot manage the range;
So Hal takes his meals in the city,
  You know a man must have a change.

All night I was up with the children,
  For Hal says "It's hard on a man
To be wakened all night with the baby,"
  Oh, grandma, dear, come if you can.

TEN YEARS AFTER.

Tell me, grandmother dear, the old story
  Of the heavenly home and its rest,
And hold me close up, as you used to,
  And lay my head down on your breast.

I'll try to look yonder to meet them,
  My two little saints gone before,
And forget the sharp pain of the arrow
  That shattered the ring I once wore.

Ah! I see it all now why you whispered,
  "The Babes in the Wood," long ago,
While I trusted the reed that has broken
  The sand-chain, the knot made of snow.

And though neither gray hair nor wrinkle
  Has come to me, now I can see
Other Babes in the Wood, and am silent,
  Foreboding, as you looked at me.

[*Ethel Lynn in New York Ledger.*

FASHION ITEMS.

WHAT a boon it would be to working womankind, those who have little leisure to follow the vagaries of fashion, if it were possible to evolve for them a costume of fur or feather material which would protect from the cold, make laundries superfluous, renovate itself, and never become old-fashioned. What an amount of time, toil, and vexation of spirit would be saved.

But alas! there is little prospect of this much needed reform ever being brought about. As it is, it requires a liberal education in designing and draping, and dress-making to properly put together one of the costumes of to-day; and a lady who, living remote from large cities (where one can gather hints from experienced costumers, or from shop windows,) succeeds in making a stylish outfit from patterns simply, may pride herself on being an accomplished woman. Why, the drapery of an overskirt requires a degree of taste and a knowledge of artistic effects which, if applied to some more pretentious object, would make the "draper" famous.

As this is an "off season" in fashions, there is little to chronicle in the line of novelties. The crop of "indications" is large, but nothing very definite has been decided on. For the early spring the prospects are that the colors and materials so popular during the past season will continue in favor. As in the winter fabrics, the dark colors—olive, bronze, blue, form solid foundations and are sprinkled or striped with gayer colors. The long-time favorites, Princess and polonaise, still retain their hold on popular favor and with a little modification a last year's garment of this description can be made to appear in the latest style. A new feature is the panel inserted back and front. It is either plain or shirred to suit the fancy of the wearer. At 6145 and 6143 are published models of some of the latest styles in polonaise.

Figure No. 1—The combination of plain and brocaded goods continues popular and is seen in all sorts of materials, from worsted to the richest of silk and velvet. The costume illustrated is composed of plain silk of a dark tint and brocaded silk of a light shade of the same color.

The skirt is a demi-train and by the insertion of fan-gores at the center of the back-breadth falls in the narrow flouncing outline which fashionable ladies consider indispensable in handsome costumes. It is simply trimmed with a box-plaited flounce of the goods set on to form its own heading, while the train and a portion of the sides are underlaid with plaited Swiss edged with lace. Sometimes two rows of trimming are employed and may be similar or contrasting in style. The pattern to this skirt may be used for any material, and is No. 1836, price 35 cents.

The polonaise is of the latest styles, and is so constructed that over any skirt of the same material it produces the effect of a Princess dress with a scarf drapery. The fronts and under-arm gores are about the length of a long cuirass basque, the front being fitted at each side by two

6143

bust darts and an under-arm dart. To these fronts and gores a drapery cut in one piece is attached, descending from right to left and laid in diagonal plaits. This drapery is of brocaded material and is trimmed with a row of white lace. The sleeves themselves are of the dark silk like the remainder of the polonaise, and are made with gatherings at the elbows.

The back and side of the polonaise are in one piece, but are fitted to the figure by a center seam terminating in an extra fullness just below the

6143

waist, and by a dart seam extending from the shoulder for a considerable distance into the skirt. The fullness of the center of the back is laid under in a box-plait, while an extra width occurring in the under-arm seam is turned forward on the under side and tacked to position. A downward turning plait is made in the front edge of the back skirt, before the seam is closed, and the skirt is also caught up twice at each side of the center, the corresponding tackings being connected by elastic straps. The bottom of the skirt is corded with light material, and may be further decorated by a continuation of the lace on the front.

The *lingerie* consists of lace arranged inside the standing collar of the polonaise and extending down the front over the *plastron* in a narrow *jabot*, that is held in place by clusters of roses and foliage.

The drapery may be of the dark material. Two shades of rich or inexpensive goods, or a combination of silk and worsted, will be found very charming for such a costume, the polonaise which was cut by pattern No. 6143, price thirty-five cents.

The *plastron* mentioned was cut by pattern No. 6161, price twenty cents. This pattern is made the full length of a lady's figure, so that a *plastron* may be made to wear over a Princess dress and polonaise. It is also marked with perforations, showing where it may be cut off for a short vest like the one represented on this figure. This *plastron* only extends under the top of the drapery and is formed of guipure net bordered with torchon lace. It is gracefully shaped to the figure, curving in below the bust and rounding up over it, and finally extending about the neck in collar-like tabs that meet and fasten at the back. The sleeves are completed with deep cuffs, which are similarly composed of net and bordering, but are straight around at the top, being in this respect unlike the pointed cuff pattern accompanying the *plastron* pattern and included under the same number.

The cuff and *plastron* may be omitted from the costume, except when the latter is worn for full dress. Or, they may be made of black lace, or of the brocaded silk. They are handsome to wear with any costume, provided they are made of appropriate materials. Silk, velvet, Swiss muslin, and *crepe lisse*, as well as the more inexpensive nets and laces, are all used in making the set.

When constructed, like the model, of black silk and dark gray suit goods, with silk pipings, silk-bound slashes, silk buttons and simulated button-holes, as decorations, it becomes particularly effective for ordinary wear, and when made of costlier materials in the fashionable evening tints, it completes a handsome toilette, that can be appropriately worn at receptions, weddings or any other entertainments where elegant costumes are required.

The center-front is formed of a vest that extends the entire length of the polonaise, and from the neck to a short distance above the bottom, is shirred over a piece of lining suitably shaped to the figure, and then falls in a moderately deep flounce, neatly hemmed at the lower edge. These shirrs are arranged in four clusters, separated by deep puffs, the two upper and largest groups being placed one above the bust and the other below the waist-line, the remaining two appearing at regular intervals below.

The side-front extends from the top of the shoulder to the bottom of the vest, and is snugly fitted to the figure by a bust dart and an exceedingly narrow under-arm gore. To its gracefully curved front edge, which is first laid in three upward-turning plaits below the middle of the skirt, is joined a *revers*, which is carefully hollowed out at the waist-line, above and below which it gradually widens. Both *revers* are made of black silk piped around the edges, and are ornamented with clusters of buttons upon simulated button-holes placed opposite the shirrs. The front edges of the side-fronts are lapped upon the adjacent edges of the vest, whose right side is joined the entire length, while the left is tacked only to a little above the second cluster of shirrs, the remaining edges being bound and joined by means of buttons and button-holes to a fly sewed beneath the edge of the front.

Although the back presents a decidedly unique effect, it is still of the stylish Princess shape, having a gracefully inflected center seam, and a handsomely formed side-back gore proceeding to the shoulder and terminating about an inch below the neck. The center-back is artistically shirred over a piece of lining made to fit perfectly to the figure, the shirrs being disposed in two groups separated by a very deep puff. At quite a distance below the waist-line an extra width is left upon the back edge of the side-back gore, and another upon the adjacent edge of the center-back, the width upon the former being turned under for a hem, while the edge of the other is neatly bound. The plaits laid in the front edge of the side-front are continued across to the back edge of the side-back gore, which from the shoulder to the extra widths is joined to the center-back in an ordinary seam. From the top of the widths the side of the center-back is lapped upon that of the gore, and after being laid in two downward-turning plaits or loops, is tacked to the latter as far as the lowest plait. Tapes, which are attached one to each plait at the back edge of the side-back gore, tie beneath the back and hold the drapery in its graceful position. The overlapping sides of the back are ornamented with silk buttons and simulated button-holes, and the bottom of the polonaise is cut in slashes, which are neatly bound with the silk.

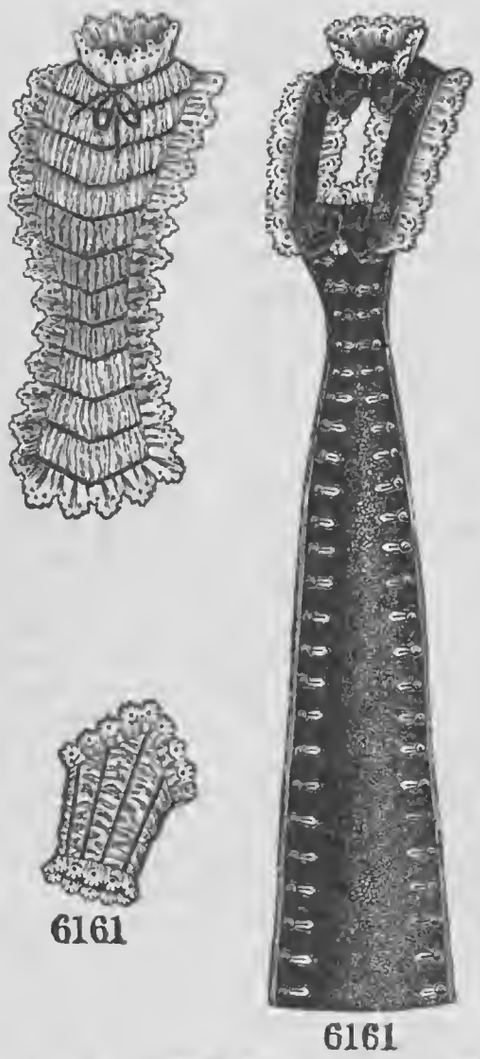
A long lap, wider at the bottom than at the top, is made of silk and sewed between the edges of the seam joining the side-back to the under-arm gore, at a short distance below the waist-line. This lap is fastened upon the under-arm gore, and is ornamented with pipings, and a row of buttons placed upon simulated button-holes of varying lengths.

The neck is stylishly completed by a fraise made of the silk. The pretty article is formed in double box-plaits at the back as far as the shoul-

LADY'S HOME TOILET.

der seams, from which it is left plain and tastefully shaped at its front edges.

The fashionably shaped coat-sleeve, with gathers underneath the elbow, is made of the silk and trimmed at the wrist with a deep puff of the material, shirred at about an inch from the upper and lower edges.



6161

6161

If preferred, the vest and center-back can be made of the contrasting fabric, and fringe, folds, pipings, lace, plaitings or galoon-bands can be employed as decorations instead of the slashes. Any pretty method of finish, and any stylish combination of materials, either of uniform or contrasting colors, are suitable for this model, which would be exceedingly handsome if composed of velvet and silk or silk and cashmere, and trimmed with satin pipings and deep silk fringe mingled with *clair de lune* beads. For a polonaise of black silk, a vest of shirred satin would be very handsome, combinations of satin and silk being particulary fashionable.

We have pattern No. 6145. In making the polonaise for a lady of medium size, ten yards of goods twenty-two inches wide, or five yards forty-eight inches wide, together with three yards and an eighth of silk for the sleeves, *revers* and laps, and a yard and five-eighths of lining material twenty-seven inches wide, will be needed. Price of pattern, thirty-five cents.

Patterns described are for sale at the office of the RURAL NEW-YORKER, at prices given.

FAITH RIPLEY.

ANSWERS TO CORRESPONDENTS.

MRS. S. G. H.—First rip the baby's cape, separating the merino from the lining and the trimming. If the satin is very much soiled, I know of no way to renovate it, except sending it to a professional cleaner. But the merino can be thoroughly cleaned by carefully washing it after the following method:

1st. Brush it well so as to get rid of dust. Use only fresh rain water, or very clear river water is preferable. With a sponge or old flannel rub up a very strong lather of either soft soap or best yellow soap. The lather may be prepared with a small quantity of water and the remainder (of the water) added boiling hot, the moment before using it. The whole should be as hot as the hand can bear it; the hotter the better. If the cape is very dirty, two lathers may be required in succession; and unless a second person is at hand to rub up the second while the first is being used, both had better be prepared in separate vessels before the wools are wetted, leaving only the boiling water to be added. Take the article to be washed and without leaving hold of it, keep on dipping and raising, dipping and raising, for two or three minutes. By that time the lather will be absorbed by the wool, and the liquor will resemble slimy suds. Squeeze the article as dry as may be *without wringing it.*

The second lather having been brought to the same heat as the first, proceed in the same manner, dipping and raising. If the article is only slightly soiled and after the first washing appears quite clean and clear, the second washing may be made in hot water without soap. Whether lather, or water only, a blue-bag may be slightly drawn through before the second washing. Having squeezed the article dry as may be, spread it on a a coarse, dry cloth pulling it out to its proper shape, lay over it another coarse dry cloth, roll up tightly and let it remain half an hour. If you care to send the cloak or the cape to me, I will have it cleaned for you, and returned in good order. The cost will be about $1.25 or $1.50. If you should decide to send it, would recommend that you rip it apart.

CLARA BREITMAN.—The most fashionable evening hat at present is a thing of lace, feathers and flowers; very much resembling a fancy cap; but in spite of its dainty appearance, horribly suggestive of such unromantic ailments as neuralgia, tooth-ache and influenza.

Literary Miscellany.

MASKED BATTERIES.

If you'll keep it secret—honor bright—
I'll tell you a little story, Joe;
Something that happened to me last night
Here at the masquerade ball, you know.

You may have noticed I've spooned of late
On Laura Clyde—nothing else to do—
She's rather pretty—at any rate,
Fond of flirting, and I am, too.

Laura's a friend of my sister Fan:
Her rooms join mine and the walls are thin,
So I, by accident heard them plan
Their dresses for masquerading in.

The ball was lovely, the costumes fine,
And either dancing or iced champagne—
Can't say which, but expect the wine—
Just a little confused my brain.

So, meeting Laura—a gypsy maid—
Knew her at once by her dress, you see—
I took her out for a promenade
On the piazza alone with me.

Flirted? Said I was deep in love,
Madly worshiped the ground she trod,
Vowed it by all below, above,
Did she return it!—a word, a nod?

The fair head dropped in assent, and I
Snatched off the mask—with rapture kissed her:
A peal of laughter was my reply,
By Jove, old boy, it was my sister!

Laugh at me, Joe! Don't spare my pride!
Nor mind my feelings—I feel so glad
It was my sister, not Laura Clyde;
Heavens! What an escape I had!

[*Vanity Verses.*

CORA.

CHAPTER IV.

"Is this prudent?" Cora said, half reproachfully, as Lord Almane came forward and took her hand.

"Do I look so very ghost-like?" he asked, smiling, as he held her hand and bent a very admiring look on her face. "Do not send me away, for pity's sake. I am so tired of solitary confinement, but I shall wish myself upstairs again if you look sorry to see me."

"I am very glad," she answered, coloring hotly under his dark eyes, and gently disengaging her hand—"very glad; and yet sorry to see you looking so ill."

"It is ten days since I had a glimpse of you," he went on, as he sat down and lent his head back on the cushions. "Ten long weary days! Have you been a little sorry for me, Miss Sinclair?"

"A little!" said Cora, impulsively; "much more than a little."

"Have you?—really?" he queried, eagerly. "I have wished to see you so much. Your brother has been all that is kind, but all his attention could not prevent me from wondering whether you thought of me sometimes, and pitied me a little."

"You have suffered a great deal," she said, gently, taking up some work to hide her embarrassment.

"And yet you have lived abroad your brother tells me. Does not Richmond seem very lifeless after Paris and Rome?"

"I was too young when we came here to feel the change," she answered. "At ten years old if one has one's favorite companions and toys it is all one needs."

"But not at twenty," he said, quickly. "Then one ought to live, not merely exist. Ah! there are such beautiful things in this world of ours. I for one, quite agree with Voltaire, in calling it 'the best of all possible worlds!'"

Cora raised her eyes wonderingly to his face, but she did not understand the expression she saw there.

"I am so many years older than you," he went on, smiling a little. "You are looking at life through rose-colored spectacles, my child. But I, who see things as they are, know that those moralizers are wrong who say there is nothing worth living for. There is much!"

He paused a moment, and meeting her wistful, wondering eyes, laughed a little as he proceeded:

"I am getting earnest," he said, lightly; "but it is rather a pet hobby of mine—the way in which the greater part of humanity waste their time, their lives, and die without ever having lived—lived in the real acceptation of the word—at all, and say, like dolts as they are, that there is nothing worth living for: Nothing!" he went on, passionately, his tones losing all their languid dreaminess in his earnestness—"nothing! when there is beauty such as yours, my child—beauty which could bring back an old man's vanished youth; when there is pleasure—the pleasure derived from the use of physical and intellectual faculties; and lastly," here his voice took the soft tender tone which was becoming familiar to Cora now—"lastly, there is love!"

"Do you know what that is, Cora? I hope not—I hope not. Ah! forgive me if I am presumptuous, let me teach you what it is. I can—I know I can, if you will let me, Nay, do not take away your hand, my child. Will you let me teach you the lesson, Cora? It shall not be a hard one, Cora."

She had risen in her agitation, but had not withdrawn her hands from his as he held them closely; both faces were passion-pale, and hers was deeply moved. He, more experienced though he was, had spoken with no small degree of emotion, for her beauty had touched him deeply.

"You have taught me to love, Cora," went on the tender musical tones; "may I not teach you the same lesson?"

The girl's head dropped, and her lips quivered, as she turned slightly toward him.

"Cora—Cora—my own!"

He had not risen but held her two hands closely clasped in one of his, and sitting there, he bowed his head over the little hands which fluttered in his grasp, and pressed his lips upon them, even as he had done once before. This time they were not withdrawn.

Marianna, passing down the garden, saw the group; one rapid glance showed her Cora's drooping head and tremulous lips; Lord Almane's pleading, passionate face and attitude of devotion. The old servant rapidly retraced her steps, and a few minutes after, with a light knock at the door, appeared in the drawing-room with

6145

6145

He did not answer, and there was a short silence. Cora knew that the dark glowing eyes were fixed upon her, and felt herself flush and grow pale under the earnest gaze. Lord Almane saw her agitation, and smiled.

"How do you generally pass your time?" he said, in a minute. "Are you much alone here? Is it not a little dull for you?"

"Oh, no!" she answered, quickly.

And Harold rose to put a chair for the old woman, whom both he and Cora always treated with the respect due to her age and faithful service.

"I will not detain you a minute, signor," she went on; a flush appeared on the yellow wrinkled face. "I only wanted to know how long Milord Almane would remain?

Harold looked a little surprised.

"Until he is quite well—as long as he likes, of course," he answered. "Why do you ask, Marianna?"

"I should be glad if he were gone, signor," said the old servant, sturdily. "Such *grands seigneurs* as he is, are out of place in our quiet home."

The young artist smiled.

"I never knew you inhospitable before," he said. "Lord Almane has fallen very easily into our quiet ways."

"Too easily," muttered Marianna, discontentedly; then she went on aloud:—"Milord Almane is quite well enough to go, signor?"

Harold lifted his eyebrows. As an old and faithful servant and friend, Marianna had many privileges; but he did not recognise her right to dictate to his guests the limit of their stay.

"Lord Almane is welcome to remain as long as he wishes, Marianna," he said, quietly. "His being well enough to go does not make any necessity for departure as long as he cares to remain."

"Signor," said Marianna, earnestly, "do you not know, can you not guess, that great as he is, and rich as he is, you possess a treasure which Milord Almane courts with all his heart? Are you willing that he should have it?"

Harold Sinclair looked up in astonishment. The woman's tone was so full of significance that he could not but see there was a deep meaning attached to her words.

"What do you mean, Marianna?"

"I mean this, signor;" and she motioned him to follow her.

Leaving the studio, which was lighted by a large window let into the roof, Harold followed her on to the landing without. An ivy-covered latticed window looked out upon the garden, and following the direction of Marianna's glance, Harold saw his sister and Lord Almane strolling up and down the little path.

It was a fair, sunshiny April morning, and the trees were putting forth their tender green shoots, the flowers their spring buds; but Harold Sinclair saw nothing but the two people who were pacing up and down in the sunlight.

Lord Almane still wore his arm in a sling, and was wrapped in a long, fur-trimmed coat; but he looked very happy and contented, notwithstanding that his face still bore marks of suffering.

Cora had caught up a gay scarlet scarf which she had thrown over her head, and twisted around her, beneath which her face looked out radiant with light and beauty—more beautiful than her brother had ever seen it before.

Harold drew back from the window, a flush of painful surprise rising to his face. Could it be possible that Lord Almane had so betrayed the laws of hospitality and honor? No, it could not be. But there was danger to Cora in the companionship; danger in playing with such edged tools. What might be amusement to Lord Almane would not be to the innocent inexperienced young girl; and his lordship could have no serious intention towards her, unless.——

"Do you think he loves her?" asked Harold, in a low tone to Marianna, as he went back to his studio.

"Ay, as he can love," she replied.

"And she?"

"She? Ah, signor, she has a child's heart, and a child's heart is easily touched, easily wounded; but, but the saints be praised, easily healed.

There was a short silence.

"Do you know aught of him, signor?"

Harold shook his head; he was feeling painfully the imprudence of his conduct in allowing the free, unrestrained companionship between his sister and his guest; but the habit of looking upon Cora as a child was strong upon him still, and he had never thought of danger.

"It must be stopped at once," he said, aloud, striding up and down the studio. "It was wrong to expose her to——"

"But, signor," the old servant interposed, "our signorina would make a beautiful *grande dame.* It may be that milord would make her his wife, and all we need ascertain is whether he is worthy of her."

Harold smiled sadly.

"Ah, Marianna, if it were so, it would be well indeed. But men like Lord Almane do not marry girls in Cora's position."

"Why not, signor?" said Marianna, almost fiercely. "The signorina comes of a family as ancient, perhaps more so, than his own."

"That may be, Marianna," replied Harold, unable to resist a smile at the old woman's flash of fierce pride. I hope the child's affections are not seriously engaged," he went on in a minute. "Leave me now, Marianna, and let me think what is best to be done."—To be continued.

WASHINGTON SIGHTS.

The Agricultural Building—Tea Growing in the South.

MARY GAY ROBINSON.

WASHINGTON, D. C., Feb. 14, 1878.

ONE of the most interesting departments in Washington is the Agricultural. Once it was a mere appendage of the Patent Office, and very suitably associated with that, as the first inven-

tions and patents in the world must have belonged to agriculture from the date that ADAM and EVE were put in the garden and told to till it.

It is but nine years since the Agricultural building, erected for the special use of this department, was completed. The grounds are handsome, rising a gradual ascent to the front; flowers, shrubs, trees, walks, and drives, ranging the foreground with hot-houses and gardens in the rear. The building is of brick, with brown-stone trimmings.

On the first floor are offices, laboratory, library, and reception rooms, opening into handsome halls upon which are hung in conspicuous places, "No vacancies"—"No one need apply for employment," &c., &c. But in spite of these, there is a waiting crowd who have brought letters of introduction and of recommendation. They are a study in themselves, ranging through all the grades of active life, from those who call themselves "working-women," to the delicate hands of wealth and idleness. It is a dreadful misfortune for a woman to have a hand so delicate she cannot use it; she is on a par with Chinese ladies with feet that cannot walk.

There were few gentlemen applicants, and those who came were too impatient to wait; but the women sit by the hour, as if waiting was second-nature. They seem to be under the influence of so much inertia, that it will take a thunderclap from the heavens to make them hear the order, "Go, work in my vineyard." The workers of the world are divided into three classes—those who can set themselves and others to work, those who can only set themselves to work, those who can work when another directs them; and outside of these ranks the drones or paupers, whom the workers have to lift and carry.

Waiting may have its place, but waiting *on* people is much more healthy than waiting *for* them, and it is pitiful to see the wrong kind of waiting at the door of office and position.

The present Commissioner is Gen. WM. G. LE DUC, a wide-awake man, who does not spare himself in his work. He fully appreciates the necessities of the country and the importance of agricultural interests; he is not afraid of enterprise or toil, for he sees far enough to know that labor is king—when labor stops, the world dies; therefore, he gives himself to looking out new industries for the people, new crops, new fields to cultivate.

One of the most interesting projects in the hands of Gen. LE DUC and his assistant, Mr. A. C. JONES, is the raising of tea in this country. Experiment has succeeded, and the time has come to go beyond experiment, and cultivate it on a large scale. His report opens with this fact:—"We import annually from China and Japan twenty million dollars' worth of tea; this large import comes to us through British merchants, who are monopolists in the trade. Once upon a time, we pitched the tea into Boston harbor, rather than pay unjust taxes, and now when hard times are crushing us, we must look about to see what we can do without, or what domestic productions can take the place of our expensive importations. The cup of tea exhilarates, without intoxicating; it is the favorite beverage of the people, and twenty million dollars a year will hire labor, land, and whatever else is necessary to get into full development this well-known evergreen which we propose to adopt. The propagating-beds of the Department are filled with healthy seedlings, and it is expected they will be able to give away a hundred thousand plants early in the spring."

We saw this hardy little shrub untouched by frost or snow, like a thrifty evergreen, in the grounds not under protecting glass; it had gone beyond need of careful nursing, and looked as bright and healthy as box. The ordinary hight of the cultivated plant is from three to six feet, and we are told the wild growth reaches fifteen or twenty feet—in fact, a tree eight or ten inches in diameter.

Tea is raised from small nuts or seeds. Three or four of these are dropped into a hole and covered with earth two or three inches deep. The weeds must be removed, of course, and at first a little shading is necessary until they are large enough to supply their own shade. They also require some pruning, and the leaves are not collected for use until the plant is three years old; when nine or ten years, they are cut down to make room for the young shoots. The tea is gathered when the leaves are small, young and juicy, and the first tender leaves make the best tea, so choice and rare that we never get it here; in fact, the best tea is worth, in China and Japan, from five to fourteen dollars a pound.

Tea gathering is a process of great niceness and delicacy; it requires delicate, clean, and skillful hands; those of women and children are best fitted for the work, and each leaf must be plucked separately from the twig with great care, so as not to injure the young leaves just coming out.

After gathering, the process of preparation for use is quite elaborate in rolling, drying, clipping, and packing ready for transportation. They pack the tea while warm, in a box perfectly dry; the evaporation of water and the drying changes the color to dark-brown or black. Teas are named from the size and age of the leaf and the locality in which they are raised.

Physicians tell us tea is not nutritious, but that it prevents waste of the system, and makes less food necessary. The Chinese drink the tea made from leaves soon after they are picked, but prepare quite a different article, dried and dressed for the foreign market, and the best authority declares the one leaf makes every variety of tea, the difference being the result of different ways of preparing. The first thing the United States might attempt would certainly be to raise enough for our own use as long as we have more workmen than work, workers whom capital refuses to employ. Some statesman must devise ways to do ourselves what foreigners now do for us.

The average price of tea as imported, is about thirty cents a pound, and it sells at retail for more than twice that amount. In latitudes adapted to its growth every farmer can have his tea garden. Four pounds of green leaves make one pound of prepared tea, and one acre will produce four hundred and fifty pounds of tea.

The States which are best adapted, from climate, for this plant, are Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Alabama, Tennessee, Kentucky, Arkansas, Missouri, and part of the Pacific coast.

Many letters have been received from people in those Southern States, who have succeeded in raising tea. They compare their success with the cotton crop, and think it bids fair to be more profitable, only the one is in full development and the other not. In South Carolina, they say the cotton yield to the acre is $15, and the best yield about $40; but tea at fifty cents a pound would bring $220.50 per acre. It figures up handsomely in prospective, but fortunes are often more easily made on paper than in reality. However, there is a wide margin for failure between a cotton crop at $15 the acre and tea at $220.50. It certainly looks promising enough to try.

Mr. IVES, of Lake City, Florida, says we ought to grow our own tea but we are not likely to, unless something is done to promote an interest in the matter. The interest may be promoted by our poverty. If hard times keep growing harder we may raise our own tea, because we cannot afford to buy from the foreign market. A gentleman who had experimented with thirteen plants and knew the elaborate process through which it must pass, said the difficulty was to obtain cheap labor at five and ten cents a day, as the Heathen Chinee sells himself, but this might be compensated by some machine to imitate hand labor. As soon as we begin to try our tea plantations, the inventors must set themselves to work to make a machine as near like a human hand as possible. Already we have many inventions in machinery that are miracles to look at, and as the future brings us whatever we need, no doubt there are countless numbers yet to come.

BRIC-A-BRAC.

BY C. H. E. R.

WHAT appreciative reader can sufficiently value books—those silent friends that develop new beauty at every turn? The more life embodied in the book, the more companionable. Like a friend, the volume salutes one pleasantly at every opening of its leaves, and entertains; we close it with charmed memories, and come again and again to the entertainment. The books that charmed us in youth recall the delight ever afterwards; we are hardly persuaded there are any like them, any deserving equally our affections. Fortunate if the best fall in our way during this susceptible and forming period of our lives. Books are to be valued for their suggestiveness even more than for their information; they may be taken in hand and laid aside, read at moments, containing sentences that quicken our thoughts and prompt to following these into their relations with life and things. We are stimulated and exalted by the perusal of books of this kind.

WINTER makes nations manly by driving men into social unities, and obliging them to live with each other, and devise ways for their amusement and instruction. In a mild climate, where there is no necessity for men to dwell under a roof, they wander abroad, and in a great measure dispense with each other's society, so that, although they may have a certain amount of cursory enjoyment, they are comparatively uninstructed. But, in a severe climate like this, when the cold season shuts men out from the field, and they retreat from their ordinary avocations, and the days are short and the evenings are long, the dwelling becomes a school-house, and there must be conversation and reading. Under such circumstances the family is a center of knowledge, and, if there be any leaven in it, a center of Christianization.

OUR ART CORNER.—Those who are interested in art in the household, will doubtless gather a hint or two from the following Art Corner chat which we clip from the Christian Union: "Our art-corner was conjured up by Isaac and me. The design was mine, most emphatically mine, for I am the artist of the family—taking to art as to the manner born. Still, to give Isaac his dues, I must say that after my designs were laid before him he showed himself very appreciative and good at a suggestion; consequently, I always use the plural in speaking possessively of that corner. In fact, Isaac did most of the work, while I superintended and added the finishing touches. Where I got my first idea of an art-corner I cannot remember—perhaps from Eastlake or Clarence Cook; or it may have been from little hints here and there that wove themselves together in my mind. But whatever it was that gave the first impulse in regard to that structure, there it stands in all its glory, the delight of my eyes, of Isaac's, and of our numerous friends and acquaintances. The beginning of it in tangible form was two boards for uprights about forty inches in length by eight and a half in width; three shelves thirty-six inches long by eight wide; another board the same size as the shelves. The latter is nailed across from one upright to the other, back of the highest shelf, the two china plates of my own decoration resting against it, while there is the delightful prospect of an additional plate, aged one hundred and fifty, to add its antique beauty to the rest. On the same shelf is a ginger jar, not loaded with all imaginable devices so closely crowded that one scarcely knows where a Chinese woman ends and a voracious looking serpent begins, but decorated with a few well-selected pictures on a pale cream-colored ground. This color was laid on in oil paint, and between the pictures, partially filling up the vacant spaces, are gilt scrolls, very easily made with a sable brush dipped into printer's gilt after the gilt is mixed with a little mucilage. An old-fashioned brass candle-stick, containing a wax candle ornamented with a little decalcomanie work, completes the furniture of the top shelf. The second shelf contains a little Japanese cabinet and tea-pot, an empty salt jar nearly covered with roses and butterflies, and a large beautifully variegated nautilus shell. On the lower shelf is a number of shells of various kinds and sizes, and two or three articles from India. But it is not so much the furniture of the shelves as the shelves themselves I want to speak about. The plain boards, brought by Isaac from a planing mill at a trifling cost, are transformed into an article that every one not in the secret supposes to have come from Japan. They are painted black, thoroughly dried, then varnished, and while the varnish is wet the printer's gilt is rubbed on in spots with a pad of wadding. Then, when thoroughly dry again) the shelves receive a final coat of varnish; carriage varnish is the best. The edges of the shelves are trimmed with scolloped points of crimson enameled cloth, nailed on with silver or brass-headed nails. Above this "high art" establishment is a standing row of Japanese fans, which give the finishing touch to our corner.

Reviews.

RECENT LITERATURE.

The House Sparrow, at home and Abroad, with some concluding remarks upon its usefulness and copious references to the literature of the subject. By THOMAS G. GENTRY. Phila., Claxton, Remsen & Haffelfinger. Price $3, with colored plate.

THIS work is a valuable contribution to "Sparrow" literature and we commend it to the careful perusal of farmers. To give our readers a fair idea of the scope and aim of the book we will quote from Mr. GENTRY in the Preface:

"In view of the many heated discussions which the sparrow has produced in this country tending to show its general usefulness or wholesale destructiveness, a careful and critical survey of its life-history, detailing the minutest particular thereof, cannot fail to awaken attention and to command respect. Agriculturists and fruit-growers mainly of all others will certainly reap the first fruits of such knowledge. The facts which the writer has gleaned from various fields of observation, but largely from his own, at infinite pains and expense subserve in the highest degree, the interests of humanity, and should not be carelessly set aside. With the disappearance of our highly insectivorous native species before the rapid and insolent advances of their hardy foreign brother and the consequent multiplication of insect foes, must come the destruction of vegetation and the entailment of untold misery upon man and beast. The sparrow itself, by reason of its almost exclusive grain-eating habits will assist in bringing about this much-to-be-regretted condition of things. He must be a fool who can close his eyes to the fact. Wherever we turn, evidence of its baneful influence confronts our vision. We cannot escape it. The writer would say that his only plea for writing this history is that a more general knowledge of the sparrow's odious practices which are manifold, shall be brought before the tillers of the soil and the growers of vegetables. Further to awaken attention to the growing evil in the confident expectation that it may be instrumental in the adoption of practicable means for getting rid of the intolerable nuisance.

The Nabob. By ALPHONSE DAUDET. Translated from the French by LUCY HOOPER. Boston: Estes & Lauriat.

THE fact of this book having gone through seventeen editions in three weeks, proves, beyond peradventure, that it is worth reading. The scene of the story is laid in Paris, under the second Empire, and a more deplorable picture of corruption and venality in social and political life it would be hard to imagine. The hero, BERNARD JACSOUTET, is a vulgar man, whose instincts and tastes render him totally unfit for the society of the polished, cynical, unprincipled Parisians by whom he is surrounded. There is something pathetic in this simple-minded, good-hearted fellow's frantic endeavor to shine in society, and his utter unconsciousness of the fact that the polite world is laughing in its sleeve at him.

It is with feelings of positive pleasure that one turns from the contemplation of the immorality and coarseness of the "upper ten" to join the delightful family circle of the JOYEUSE. The charming "Grandmother" is only a little more adorable than Papa JOYEUSE, with whom we sympathise acutely when he grieves over the loss of his position. As a whole, the story is clever in conception and brilliant in execution.

Our Merchant Marine. A Voice for American Commerce. By CHAS. S. HILL. New York: D. Appleton & Co.

UNDER this title Mr. HILL, in a monograph of some 60 pages, has given to those interested in American commerce a compilation of facts and figures worthy of their closest consideration. Mr. HILL draws attention to the vast *internal* developments of our country, under the auspices of the Government, within the past few years, and the proportionate neglect and decay of our commercial resources, comparing these features with the fostering care bestowed by other nations upon their merchant marine, and the consequent benefits that have accrued to them. He urges upon all classes—mechanics, merchants and farmers—a revival of interest in the subject, and points out the means of retrieving our loss and placing American commerce once more on a footing with that of the leading nations of the world.

Leedle Yawcob Strauss, and other Poems. By CHARLES F. ADAMS. Boston: Lee & Shepard. Cloth; $1.50.

THE ephemeral popularity of such ballads as "Leedle Yawcob Strauss," "The Puzzled Dutchman," and the like, whose sole merit seems to rest upon the correct rendition of a maudlin Dutchman's broken English, do not make for a man the reputation of a poet. Nor do the parodies and weak imitations which, with them, make up this book of "poems," contribute aught of originality or piquancy to the collection. The volume is not one we can commend as an addition to one's library, notwithstanding its attractive exterior and clever illustrations.

Quinnebasset Girls. By SOPHIE MAY. Boston: Lee & Shepard.

THE charm of this book lies in the naturalness of "the girls." They are true to life and, notwithstanding their sometime naughtiness, utterly charming. The chapter on "Spiritual Lilies" we would especially commend to those of our young friends who are beginning to feel an attraction for table turnings, phantom bouquets, and other peculiar "*spiritual*" manifestations.

MAGAZINE NOTES.

THE ATLANTIC, March issue, is brimful of interesting matter, and the papers are selected with great aptness, making a varied table of contents that will captivate most diverse tastes. "Detmold:" a romance, opens the number. This serial grows in interest. Edward H. Knight contributes the eleventh article on Crude and Curious Inventions at the Centennial Exhibition. The poetry is contributed by C. P. Lathrop, Whittier, L. C. L. Cleaveland and Longfellow; while Mr. Steadman's poetry is the subject of an appreciative paper by J. J. Platt. Mark Twain is excessively funny with The Loves of Alonzo Fitz Clarence and Rosannah Ethelton, while C. D. Warner continues to verify the Adirondacks in the most delightfully humorous way. The Opposition to Lincoln in 1864, by the late Gideon Welles, Victor Emmanuel's Political Work, The Story of a Swiss Ring Politician, together with the Contributors' Club, and the usual departments make up a charming number.

SCRIBNER'S has has not yet reached its ideal. It improves with each number both as to matter and illustrations. The March number opens with an agreeable paper on Central America by E. Westervelt. The serials, His Inheritance, and Roxy, sustain their interest. Concerning a Prodigal, by Henry King, is a quaint bit of writing that will be appreciated; Noah Brooks' Personal Reminiscences of Lincoln, of which we have the second paper in this number, are most interesting, and furnish new anecdotes and traits of the man. The three remaining illustrated articles are: An Earthquake Experience, Dresden China, and Kenyon College. Saxe Holm contributes a story, and Boyesen figures among the poets.

ST. NICHOLAS is as captivating as ever. Two full page illustrations: A Horse at Sea, and The London Chickweed Man are very spirited, but the whole number is so replete with fine specimens of art work that it seems invidious to make distinctions. Here are the titles of the prominent papers: Hansa, The Little Lapp Maiden, Secrets of The Atlantic Cable, A Night with a Bear, Westminster Abbey, Crumbs from Older Reading, and The Boy in the Box.

THE IOWA LIBERAL, edited by Mr. C. F. Leidy, at Le Mars, Iowa, is one of the best country exchanges that reach this office. Every issue of the Liberal is brimful of spicy, readable news, showing to good advantage the go-aheaditive characteristics of our Western cousins. Those of our readers who want to learn concerning the Northwest, will save time and trouble by sending fifty cents, and securing the Liberal for three months.

ALL of our readers interested in the sea, and sea songs, should send fifty cents to PROCTOR BROTHERS, Gloucester, Mass., and receive per return mail a copy of "The Fisherman's Ballads and Songs of the Sea." It contains 121 songs and ballads, handsomely printed and finely illustrated.

LIPPINCOTT'S MAGAZINE for March maintains its usual standard of excellence. It contains among other attractive matter, Edward King's second paper on "With The Russians in Bulgaria," which those who have heretofore trusted entirely to English sources, for information respecting Russian campaigns, can accept as a fair showing of the "other side." A story by Clara M. Green, entitled "Miss Twill's Observations," is extremely chatty and pleasant, and M. F. Synge's poem "The Withered Chaplet," is as dainty a bit of sentiment as we have met with in some time. "Small Farce and Comedy," by Mary Dean, is an idyl of the children, and although the mind masculine can hardly appreciate her rhapsodies; most mothers will doubtless cordially endorse the author's idealization of the little folks. The installment of "For Percival," the anonymous serial, is particularly clever.

The Querist.

ANSWERS TO CORRESPONDENTS.

Miscellaneous.

Mrs. Julia A. Judd, Bee Co., Texas.—I have just received the seeds, for which accept many thanks. There are two kinds that I cannot find in my catalogues, and I am no botonist and not much of a florist, except in my love for them. I do not know how to treat them. They are Eryngium Leavenworthii, and Glaucium luteum. Please tell me about them.

ANS.—Eryngium Leavonworthii is one of the showiest, most striking annuals that has been introduced for many years. Treat them in the same way you would Balsam seeds. Glaucium luteum is a hardy perennial and of the easiest cultivation. It is suitable for edgings and borders.

Wm. S. Ross, Wood Co., Ohio.—Will the RURAL please state the difference between the Voltaic Armadillo Electrical bands and soles of E. J. LEIBERT, New York, and Pulvermacher's chains and belts.

ANS.—We have never seen the first named, but should suppose that the respective pamphlets of the two firms would lucidly explain the points of difference.

Miss M. J. R.—We extend our thanks for poem copied and sent us. We cannot use it because it is protected by copyright, and published in book-form. It would be an injustice, moreover, to the author and his publishers to do so. Thanks, also, for other offer, which we must decline.

Address mislaid.—Would you kindly name for me the inclosed plants? A portion are wild, the rest garden plants.

ANS.—The flowers reached us in such a forlorn condition that we cannot name them all:

1. Kerria Japonica. 2. Lysimachia nummularia. 3. Achillea Ptarmica. 4. Missing. 5. Anemone quinquefolia. 6. Physostegia Virginiana. 7. Gillenia trifoliata. 8. Missing. 9. A Ranunculaceous plant. Helleborus perhaps. 10. Hibiscus moschoutos. 11. A mallow of some kind. Callirrhoe? 12. Missing. 13. Trillium erectum (?). 14. Cannot determine. 15. Tradescantia pilosa.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING MONDAY, FEB. 25TH.

News of the Week.

CONDENSED NEW YORK TELEGRAMS.

TUESDAY, Feb. 19.—All the reports about Sitting Bull having crossed the frontier, were got up by people interested in the establishment of new forts or contracts for supplies.

Germany asks Russia not to occupy Constantinople. Europe is drawing a long breath of relief, after having escaped an imminent peril; but things are still more than a trifle menacing.

WEDNESDAY, Feb. 20.—After the passage of the Silver Bill, a vigorous effort will be made to repeal the act for the resumption of specie payments in 1879.

The Russians are still massing troops in Turkish territory. They have concentrated 300,000 men in Roumania, not a little to the distrust of Austria. Servia and Roumania are both indignant at Russian treatment of them. The Conclave for the election of a new Pope has just commenced.

THURSDAY, Feb. 21.—The Senate has restored the franking privilege. Darrall, Rep. of La., has been unseated by the House, and Acklin, Dem., seated in his place. Republicans complain bitterly of gross injustice in this and other cases of contested elections.

Prince Bismarck has made a speech in which he says Germany has no rivalry with England, except in friendly trade, is friendly with Austria, hopes Russia will be moderate, is willing to use her good offices for peace; but must decline to arbitrate, and will not go to war unless German interests are threatened; which is not the case now.

Cardinal Pecci has been elected Pope, under the name of Leo XIII. Out of 61 Cardinals in the Conclave he got 43 votes on the third ballot, and was then nominated unanimously.

FRIDAY, Feb. 22.—The Silver Bill as amended in the Senate, has been passed by the House. Williamson of La., has been rejected by the Senate as Collector at New Orleans.

Various conflicting rumors regarding European complications. England growing more resolute as public opinion becomes stronger against Russian aggrandizement. Russia will certainly insist on grasping everything she can by any possibility secure. Suleiman Pasha has been placed under arrest, degraded and banished.

SATURDAY, Feb. 23.—President Hayes will certainly veto the Silver Bill. W. E. Chandler has written another letter on the La: matter strengthening his charges of a corrupt bargain.

The Russians will occupy Constantinople unless the Turks agree at once to the terms of peace dictated to them. Austria has decided to mobilize a portion of her army. Bismarck's speech meets with favor in Vienna, but with disapproval at St. Petersburg.

SUNDAY, Feb. 24.—Late rains here have caused very disastrous floods in California.

A crisis appears to be approaching in European politics. Russia is delaying the meeting of the Congress or Conference while consolidating her power in prostrate Turkey, negotiating with Austria, conciliating Germany, and forcing Turkey to sign a disastrous peace, so as to meet the other Powers on the basis of accomplished facts. The whole of Europe is now armed to the teeth, while every day fresh forces are mustered in and armaments increased, so that a violent outbreak may be expected at any moment, and would perhaps, be preferable to this state of suspense, uncertainty, and mutual distrust and animosity.

MONDAY, Feb. 25.—The Silver Bill. It is now pretty generally conceded will be passed over the President's veto. It is probable that its effects will be neither so disastrous as its opponents think certain, nor so beneficial as its advocates expect. "Returning Board" Anderson's appeal for a new trial has been denied.

The prospects of a settlement of European affairs are by no means improved by the latest conditions reported to be imposed by the Muscovite on the Ottoman. Russia demands a war indemnity of $1,120,000,000, and is to hold Batoum, Kars, Ardahan and adjacent Armenia until it is paid:—that is virtually always. Another trifle of $200,000,000 is to be paid for various specified accounts and four iron-clads to be surrendered. Virtually Turkey is obliterated as an independent sovereignty in Europe, being mortgaged hand and foot to Russia, and despoiled of all influence and extensive tracts of her territory to be ceded to Montenegro, Bulgaria, and Roumania. The enforcement of these conditions means *war*. There seems little use of a Conference or Congress, as Russia insists that peace shall be concluded before it assembles, and denies the right of the assembly to touch the chief conditions of the settlement. Meanwhile the war spirit is hot and intolerant in England; preparations for war are rapidly pushed forward. Austria is growing very restive and the outlook is stormy. It seems probable that the new Pope, Leo XIII, will become reconciled to the various governments with which Pius IX was at variance.

HOME NEWS PARAGRAPHS.

Seventy-five dogs afflicted with hydrophobia have been killed in one county in Georgia.

More than a thousand persons were in Nashville, Tenn., last month looking for homes in the famous farming country near by. They were from half the States in the Union. A tide of immigration to that region has set in that makes Kentucky green with envy.

The Massachusetts Board of Agriculture complains that the rural horse trot at county fairs lowers the tone of the exhibition, and fills New England with a class of horses that are of little practical benefit. The cattle show managers, however, say that the trotting is the only paying feature.

What a few years of good rule can do for the colored men in a Southern State is evinced by the fact that the 84,164 colored voters of Georgia own 457,635 acres of land worth $1,244,104, city property worth $1,199,725, personal property worth $486,528, stock worth $241,106, and other property worth $2,250,000,

Frog culture is the latest Western industry, and is being systematically carried on in Minnesota. It is a simple process, consisting chiefly in the protection of eggs and tadpoles from birds and other enemies by means of wire screens. The product thus far reported amounts to 3,00 dozen legs, of which two-thirds have been shipped to St. Louis, where they bring an average of twenty cents per dozen.

A Chicago man, visiting in Pittsburgh, was crossing a lonely bridge, when a well-dressed lady met him, knocked him down, and took from his pockets every cent. He was frightened nearly to death, made complaint, and had the woman arrested. It transpired that she was his wife, and knew that he could not go to Pittsburgh without getting drunk and wasting his substance. He smiled a sad smile and withdrew the complaint.

The exportation of forest tree seed is assuming dimensions in this country. California sends $10,000 worth per year. The principal purchases are made for Germany, Austria, England, and the colonies, in Austria and New Zealand; and at present the demand exceeds the supply. The seeds of the Oregon pine, known also as the yellow fir, are most in demand. The timber of that tree is as good as British oak for ship building, and has been found sound after eighteen years use for this purpos The South Sea colonies are planting the Californi red wood tree extensively

From observations made on specimens still in existence, the longevity of various trees has been estimated to be, in round numbers, as follows: Deciduous cypress, 6,000 years; baobab trees, 5,000; dragon trees, 5,000; yew, 3,000; cedar of Lebanon; 3,000; "great trees" of California, 3,000; chestnut, 3,000; olive, 2,500; oak, 1,600; orange, 1,500; Oriental plane, 1,200; cabbage palm, 700; lime, 600; ash 400; cocoanut palm, 300; pear, 300; apple, 200; Brazil wine palm, 150; Scotch fir, 100; and the balm of Gilead about 50 years.

The Ætna Life Insurance Company of Hartford, Conn., with its assets of $24,141,175.20 and its clean surplus of nearly four and a quarter millions of dollars, and its well known ecomonical management, has recently received a well merited endorsement from the Special Commission appointed by the Legislature of Connecticut a year ago, to investigate all the Life Insurance Companies of that State. The Commission say of the Ætna that it is "not only solvent, but financially sound, and under the management of officers and directors of large experience, sound judgment and unblemished character, and entitled to the entire confidence of policy-holders and the public."

FOREIGN NOTES.

Cowansville, Ont., boasts of a bride who was recently led to the altar for the fourth time, and who is not over eighteen years of age.

In Russia a husband may appear as a witness in a lawsuit against his wife, but a wife is not heard against her husband, neither has she any redress against him if he deserts her.

A single orange tree in the Azores in one year produced twenty thousand oranges in a fit state for exportation. The Azores send every year to London more than two hundred thousand boxes of oranges.

An Austrian surgeon says that when the Russians took Kars they not only pillaged the shops, but they entered the hospitals and took everything of value they could find, even from the sick and wounded.

Before the Church of Our Lady of Atocha, in which the King of Spain was lately married, a sentinel perpetually stands on guard. The Virgin of Atocha has long held the rank of Colonel in the Spanish army. Hence the military honor.

Cleopatra's Needle cannot be placed in Parliament Square, London, because the Metropolitan Railway demands a perpetual indemnity against risk of accident. Application has been made to the authorities for permission to erect it between Charing Cross and Waterloo bridges, on the top of the Adelphi steps.

Before France stopped the coinage of silver five-franc pieces she had more of these pieces (or unlimited legal tender silver) than our mints could strike in seven years. The enormous sum of 773,130,000 in five-franc silver pieces was in the Bank of France on July 15, 1877.

The French Minister of Public Works has laid plans for the execution of new lines of railways and canals which will cost, for the former, 3,000,000,000 francs, and for the latter, 1,000,000,000 francs. It is expected that these works will consume ten years in their construction.

It is stated that one of the principal rose firms of England purchases annually from sixty thousand to eighty thousand briar stocks upon which to bud standard roses. These when received are sorted, trimmed, and planted out where they are to grow until sold. The proper time for budding these stocks in England is said to be in July, earlier or later, according to the season.

The Gazette of Moscow publishes a letter from Mr. Gladstone (the late British Premier) to a friend in Russia, in which he talks of the "theatrical farces of Lord Beaconsfield," characterizes Osman Pasha as a coarse brute, though courageous; thinks that the palm for strategy during the late war should be awarded to Gen. Gourkho; glorifies the brave little State of Montenegro; and hopes that Bulgaria will be free from all connection with Turkey.

Trustworthy statistics, regarding the recent famine in India, show that out of 1,668,000 inhabitants in the district of Bellary, 14,006 died of starvation, in March alone, 1877. In that of Cydarah, out of 1,300,000, there died in February, 11,442; in Kurnaul, out of 952,640, those that starved in January numbered 6,553. Out of 29,000,000 in Madras, there died in February 105,172, and by the end of June over 500,000. Bombay lost over 165,000 in the first three months of the year, and it was anticipated that before relief came a total of 2,000,000 would die.

The Italian papers abound with incidents of Victor Emmanuel's life. When Thiers visited him, he said the late King was "the *plus fin* of political men." Cavour said of him: "He allows us to go ahead until we are compelled to stop; then he undertakes to show us the way, and it is always the right one." The title of "Gentleman-King," so frequently applied to Victor Emmanuel, originated soon after the battle of Novara, when, apprehending the possibility of becoming only a vassel of Austria, he called d'Azeglio to the head of his Government. To that diplomat he said: "There are so few gentlemen-Kings that it would be well to begin the line." The evening Charles Albert fled to Portugal, Victor Emmanuel, on leaving Radetzki's tent, exclaimed: "No; I don't want to be King of Sardania. You once told my father that Italy was his. Nearly true, for Italy shall be mine."

Manufacturers of Clothing and ladies' suits find the New Davis Sewing Machine adapted to the full range of their work, trimming, binding, sewing thick and thin goods, over-seams, without any difficulty, and requiring no basting or change of tension. The DAVIS SEWING MACHINE CO. are enlarging their manufactory at Watertown, N. Y., to enable them to supply the increasing demand for their machines.

Happy tidings for nervous sufferers, and those who have been dosed, drugged and quacked. Pulvermacher's Electric Belts effectually cure premature debility, weakness and decay. Book and Journal, with information worth thousands, mailed free. Address PULVERMACHER GALVANIC CO. Cincinnati, Ohio.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, Feb. 23, 1878.

BEANS AND PEAS.—Receipts of beans past week, 8,916 bbls.; Exports, 242 bbls. The bean market, as a rule, is in a weak condition. Mediums have no stimulating demand, and are again off 5c. for choice. Cuban advices represent the market as dull, and marrows are consequently very quiet. Pea beans have not rallied from their old nominal position. White kidneys lower, in sympathy with marrows. Red have some small sale yet. In black there is a rev ved call, prices a little better. Green peas are dull and offered lower to arrive, at $1.15@1.20. Southern B. E. peas, $3.25 per two bushel bag. Canadian field peas quiet at 85c. for general stock.

We quote:—Beans, medium choice, $1.70@1.70; other, $1.50@1.60; marrows, choice, $1.80@1.90; other, $1.70@1.80; pea, $1.60@1.65. White kidney, choice, $1.90@1.93; other, $1.85@1.95; red, choice, $2.00@2.50; other, $2.35@2.40. Turtle soup beans, $1.60. Lima, $3.

BEESWAX.—There is a slow market and prices unsettled; Western and Southern quoted at 27@25c.

Exports since Jan. 1, 25,775 lbs.—19,100 more than for same date last year.

BROOM CORN.—The trade is very light and prices unsettled.

Green brush at 6@7½c.; green hurl, 5@6½c.; medium green, 5@6½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—There is little new to remark in butter. Receipts are quite liberal, surprisingly so in view of former advices as to remaining part of crop, and with the last winter month going out, sellers are disposed to favor buyers of medium and good qualities. The fancy reserves of State half-tubs and regular receipts of Western creamery are just as firm on dull days as when high-priced buyers appear. This indicates that holders are not afraid that choice old stock will lap upon new to the detriment of present strong quotations. Late supplies do not make much addition to the stock of upper grade. Deliveries of Western are not in excess of the wants of trade and fine factory will bring 22c. Exporters would take some of the good grades of Western but sellers who make Western a speciality, prefer to accomodate the city demand.

We quote State creamery, 25@35c.; fancy pails, 30@32c.; other 25@28c.; creamery, good to choice, 25@35c.; half tubs, fine, 28 30c.; extra, 33@37c.; other, 22@27c.; Fall Welsh 25@29c.; Welsh tubs, dairy, 25@27c.; other, 20 23c.; Fall dairies, fine, 28@30c.; common, 20@24c.; Rolls, 20@27c.; poor State, 14@21c.; Western creamery, good to choice, 40@42c.; poor to good, 25@32c.; factory, choice, 20@21c.; good, 15@18c.; common, 7@11c.; rolls, 12@18c.; grease, 6½@7c.

Receipts for the week, 15,435 pkgs.

Exports past week, 2,163 pkgs

CHEESE.—There is a steady fair trade from exporters and the home trade. Stock is running down sufficiently to give a steady feeling as to prices.

Fancy factories, 13½ 13¾c.; good and prime, 13@14½c.; fair lots, 12½@12¾c.; poor, 10@10½c.; 7@10c., skimmed. Farm dairy, 12@13c. for good to prime; 10½@11½c. for fair lots; 7@10c. for skimmed; Western factory, cheddar, 13@13½c. for fine 11@12c. for good; 5@9c. for poor.

Exports for the week, 23,093 boxes.

Liverpool cable, 70s. Gold closes 102¼.

COTTON.—The tendency has been slightly upward, with a more active market.

Latest prices are for February, 10.88@10.90c.; March, 10.64@10.90c.; April, 10.78c.; May, 10.92c.; June, 11.05c.; July, 10.21@10.13c.; August, 11.40@11.41c.; September, 10.19@10.21c.; October, 10.75@10.77c.; November, 10.78@10.70c.; December, 10.91@10.90c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	8 3-16	8 3-16	8 5-16	8 5-16
Strict ordinary	8 13-16	8 13-16	8 15-16	8 15-16
Good ordinary	9⅛	9⅛	9¼	9⅜
Strict good do	9 13-16	9 13-16	9 15-16	9 15-16
Low middling	10 3-16	10 3-16	10 5-16	10 5-16
Strict low middling	10 9-16	10 9-16	10 11-16	10 11-16
Middling	10⅞	10⅞	11	11
Good middling	11⅛	11⅛	11⅜	11⅜
Strict good middling	11 9-16	11 9-16	11 11-16	11 11-16
Middling fair	12 1-16	12 1-16	12 3-16	12 3-16
Fair	12 9-16	12 9-16	12 11-16	10 11-16

Stained.

Good ordinary, 8 3-16c. Strict ordinary, 8 15-16c.; Low middling, 9 7-16c.; Middling, 10 1-16c.

DRIED FRUITS.—Apples have a fair home trade demand, and the better grades are at strong prices. Peaches and small fruits are nominal.

Apples—State quarters, old, 5¾@6¼c.; new, 5¾@6¼c.; Western quarters, old, 6@6½c.; new, 5¼@5¾c.; Southern, new, prime sliced, 7c.; fair to good, 5@5¼c. Peaches—Peeled, new, 9@10c.; unpeeled halves, 4½ 5c.; unpeeled quarters, 3½@4c. Pitted cherries, 16@17c. Blackberries, 8@10c. Raspberries, 27c. Plums, 16c. and Southern at 10c.

Exports past week, 116 bbls. apples; since Jan. 1, 750: same time last year, 8,925.

EGGS.—Receipts for the week, 6,950 barrels. Supplies have fallen off, but they are still unreasonably large, and the market is perplexed with the supplies of unsold Stock. Unless this class of stock is put out of the way before Lent—which begins on the 6th—the Lenten market will be deprived of its snap. Best wholesaling stock is down to 25c., and sellers do not anticipate a further decline for reliable qualities.

Near points, 17@17c.; State and Pennsylvania, in good order, 15¾c.; Western best, 14½c.; do. Southern, 14½@15c.; inferior and off quality, 9@12c.; State and Canadian, limed, 9@11c.; Western, 9@11c.

FEATHERS.—Live white prime Western geese, 45@47c., mixed, 30@40c.

FEED.—Is more freely offered and easier. Sales 40 pounds ave. $19.00@20.00; 60 pounds ave. $18.00@19; 80 pounds ave., $18@19; 100 pounds, $19.00@20; and sharps at $20@22.

FLOUR has been less active with the changed situation abroad, and prices have eased off a little, closing, however, stronger.

Latest prices are $4.25@4.85 for poor to fancy superfine State; $4.30@5.25 for common to fair extra do; $5.25@.60 for good to choice do.; $4.25@4.85 for superfine Michigan, Indiana, Iowa, &c., outside for choice; $4.90@5.25 for shipping extra do., the inside price for poor, and $5.25@5.60 for good to strictly fancy extra do.; common to choice white wheat extras, $5.50@6.75; fancy do. at $6.75@7.75; red and amber winter wheat, good to choice family, at $5.25@6.75; round hoop Ohio at $5.10@5.50, and trade brands of do. at $5.60@7.00, the latter for choice; St. Louis, $5.50@5.35 for poor to fair extra and $6.35@7.25 for good to fancy, (with a few brands of very fancy quality quoted up to $7.50 a $8.00); Minnesota clear, $5.00@5.15; Minnesota "straight," common to fancy, at $5.75@6.30 and patent poor to very choice, $6.35@8.50, with a few fancy at $8.75@9.00; unsound stock at $2.35@5.75; city mill extra at $6.00@6.40 for fair to very choice for West Indies; do. for England $5.10@5.25; do. trade and

family extras, $6.50@7.50; do. South America, $6.50@7.50 for fair to fancy; No. 2 at $2.75@3.90.

Buckwheat Flour—Quoted at $2@2.60. Corn meal is selling at $2.50@2.90 for Western yellow and $3.20@3.25 for Brandywine.

FRESH FRUITS.—Exports of apples past week, 900. Fresh arrivals of apples are selling about as well as stored. The latter are down to a small quantity. Railroad receipts are varied in quality, and it must be remembered that many parcels turn out different from their home appearance and cannot be quoted at full figures as live prices. Baldwins and Greenings, $5@5.50; "Seeks" and Spitzenbergh, $6@7.50; Russets, $4.50@5.; rough and rejections, $2.50@4.50. Cranberries have advanced; fancy bls., $9.00; good, $7.50; do. crate, choice, $3; good, $2.12@2.12; fair, $1.50@2.25. Florida oranges, $3.50@5.00. Peanuts declined again this week but buyers are few; daily receipts more than supply them. Best hand-picked Virginia, $1.30@1.40; good to fancy, 85c.@$1.20. Hickory nuts, 75c.@$1. Pecans, Texas, 8@10c. per pound. Since these latter have been arriving commercially the old-fashioned demand for Shellbarks is much reduced.

FURS AND SKINS.—Shipments for the London March sales have subsided and the market has resumed its quiet neglected position.

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₩ piece	$3 00@ 4 00	$2 00@ 2 50
Gray Fox	40@ 45	40@ 45
Red Fox	75@ 80	60@ 65
Black Bear	5 00@ 6 00	4 00@ 5 00
Brown cubs and ylgs.	1 00@ 2 00	1 00@ 2 00
Florida deer skins.	15@ 18	
Fisher	5 00@ 6 00	4 00@ 5 00
Mink, dark	85@ 1 00	50@ 60
pale	50@ 60	30@ 40
Muskrat, winter	8@ 10	6@ 8
fall	6@ 7	4@ 5
Kitts	@ 2	@ 2
Beaver, ₩ ℔	1 00@ 1 25	60@ 75
Raccoon	35@ 45	35@ 45
Opossum	3@ 6	3@ 6
Skunk, black		50@ 60
striped		7@ 30
Wolf, mountain		1 50@ 2 00
prairie		50@ 60

GRAIN.—All articles have been affected by the variable reports from the other side, but have generally tended lower until the close when a stronger feeling has set in.

Latest sales are of No. 2 red at $1 35@— ungraded red and amber State, $1 35@—; white, $1 44; No 1 Northwest spring, $1 26; No. 3 Chicago, $1 20¾; No. 2 red for January at $1 28¼; No. 2 Milwaukee spring, $1 30. Rye is a trifle steadier; sales of Western at 71@72c.; State at 7.@—c. Barley, 66c for No. 1 Canada; 56@56c. for six-rowed State. Corn is weak and quiet. Latest sales are of New York No. 2 at 58@—c.; steamer mixed. February, 53¼@54¼c. Oats of New York extra white, at 38@38½c.; do. No. 1, Febuary, 35¼c.; No. 2 white 35¼c.; mixed Western, 35¼@37c.; white Western, 37@39¼c.

HAY AND STRAW.—Shipping grades of hay are most wanted and they bring steady prices. Prime stock is plenty and dull.

Bale hay, 65@70c. for shipping, and 70@85c. for retail qualities; clover, 40@50c. for prime. Straw, 50@60c. for long rye; 50@55c. for short rye, and 40@45c. for oat.

Exports since Jan. 1, 8,750 bales; same time last year, 8,600 do.

HIGHWINES are higher—$1.08½@1.09 regular.

HONEY.—Continues dull. White clover, 2-comb boxes, has sold at 13@14c.; dark and buckwheat at 8@10c.

HOPS.—There is a good strong market with a fair degree of activity especially in good and prime stock. State choice to fancy, 11@13c.; good to prime 8@10c; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Californians, 12@14c.

LEATHER.—Hemlock sole, 20@21½c. for light, 21@22c. for middle, 21@22½c. for heavy, 19@20c. for good damaged.

MAPLE SUGAR.—The quotations for reputed new is 14c. It is the old story with the demand, buyers will not purchase freely until new crop is a settled fact.

OIL-CAKE.—Western is quoted at $30@31 ₩ ton.

POULTRY AND GAME.—Supplies of live poultry are light, but the demand is also very light and prices are very easy. Geese, to bring best rates, must be choice. A good many old ones are pushed forward, and this hurts general sales.

N. J. chickens, 7@9c.; W. fowls, 8@9c.; Turkeys, 9@10c.; Toms, 6@8c.; Ducks, N. J., pair, 87@$1.12; Geese, N. J., $1.75@2.00; Western, $1.00@1.37.

We are having soft weather again, and the dressed poultry trade is not helped thereby. Supplies are moderate, but the average of stock is not attractive, and prices are easy and lower for any item but ducks. Large turkeys are a drug.

Fancy Phila. and N. J. turkeys, 13@14c.; good, 10@11c.; large or Toms, 7@9c.; chickens, choice, 12c.; good, 11@13c.; common, 6@7c.; ducks, choice, 16@—c.; other, 13@14c.; geese, fancy, 11c.; other, 7@9c. Capons large 18@20c. small and slips, 15@16c.

Game is scarce, and the short-seasoned kids are winding up high. Missouri pigeons dress better, and Ohio outsell them at an almost doubled price. The law for the sale of grouse, quail, and rabbits expires this week.

Hares and rabbits, pair, 20@25c. Canvas-back ducks, $2.00@2.50; Red-heads, $1.50; Mallard, 65@75c.; Teal, 30@50c.; Quail, prime, $2.75@3.00; soft, $2.25@2.50. Partridges, pair, 75c.@$8.c. Grouse, $1.00@1.50; poor, 90c.@$1.10.

PROVISIONS.—Hog products have tended a little stronger but at irregular prices, closing firm. Mess pork, $11@11.14½ for uninspected spot lots; $11@11.15 for March and April. Bacon at 5¾@5¾c. for long clear and 5¾c. for short clear. Lard—Western steam at 7-57½c. for spot, 7-60c. for March, 7-72½c. for April. Tallow at 7¾c. for prime. Stearine, 8c. for prime Western. Beef hams at $16.50. Beef—New extra mess, $12.50@13.00; plain, $11.00@12.00; now packet, $14.75; family mess, $17.50; extra India mess, $23 for city brands; do. Philadelphia, $26.00.

SALT.—Ashton's at $2.50; Higgins', $2.40 and other sack lots at $1.10@1.15; Liverpool ground, 60@65c.

SEED.—Clover, 7¼@7¾c. for Western; 7¾@7¾c. for State. Timothy, $1.35@1.45. Rough flax, $1.55.

SUGAR.—Refined at 10¾c. for cut-loaf; crushed, 10c.; powdered, 9¾c.; granulated, 9¾c.; soft white, 8½@9c.; soft yellow, 7½@8¼c.

TOBACCO.—Export demand has been very fair and home demand small, but prices held as before.

VEGETABLES.—Exports of potatoes past week, 1,410 bbls. The market is fairly active for potatoes for home use at old prices. There seems to be some difficulty in buying straight lines of seed. Packers demand 50@62½c. ₩ bbl. for choice red stock. Bermuda potatoes, $1.50@5. Garden stuff is not active, but produce in fine order is quoted with some firmness.

We quote Peach Blows $1.75@1.87, bulk and double-heads. Early Rose, $1.75@1.87; Peerless, $1.25@1.50; Nova Scotia, $1.95@2.00; Sweet, $2.25@2.50. Cabbages, 100, $3.00@4.00; red, 5@6. Marrow squash, bbl., $1.50@2; Hubbard do., $2.00@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., @2@75c. Red and yellow onions, $1.25@1.50; white, $1.25@1.75. Celery, doz., 75c.@$1. Hot-house mushrooms, ₩ ℔, 20@40c. Radishes, 100 bunches, $4@4.50. Lettuce, small, dozen, 75c.; large, $1.50@$2. Cucumbers, doz., $1@2. Rhubarb, doz., $1. Spinach, Southern, $1 75@2.25 ₩ bbl.

WOOL.—Fine grades are lower, but otherwise there is a fairly steady market, with rather a freer trade from manufacturers.

Ohio, Pennsylvania and Virginia—XXX and picklock, 46@48c.; XX, 43@44c.; X, 42@43c; No. 1, 42@43c.; No. 2, 36@38c.; common, 31@33c.; combing, 55@56c.

New York, Michigan, Indiana and Wisconsin—XX, 36@40c.; X, 36@40c.; No. 1, 38@42c.; No. 2, 35@37; common, 32@33c.; combing, 46@53c.

Iowa, Vermont and Illinois—X and XX, 35@38c.; No. 1, 37@40c.; No. 2, 32@31c.; combing, 45@52c.

Missouri Kentucky and Tennessee—37@42c. for washed; 25@30c. for unwashed, and 32@33c. for unwashed combing.

LIVE STOCK MARKETS.

NEW YORK, Feb. 25, 1878.

BEEVES.—Receipts for the week, 10,001 head; do., last week, 10,076 do. The regular selling days have had a steady demand, and as an indication that butchers wanted stock: the detained cattle for Friday were patiently waited for. The bulk of the sales were at 8¾@9¾c. for good useful to prime steers. The extreme range for rough oxen to fancy pairs, is 7½@11½c., with lot Ohio, Illinois, and Missouri steers that had been held a day or so bringing 9@"¾c.; heavy bulls, $3.90 ₩ 100 ℔, live weight. Quite serious losses on shipboard have attended the recent exportation of live bullocks. The tone of Western cattle points lead to the belief that an easy range will rule during the spring months for the large supply of medium quality stock known to be in the country.

COWS AND CALVES.—Light arrivals more than fill the demand. The nominal quotations are $40@70 ₩ head for good to choice, with very common as low as $25@30.

VEAL CALVES.—There is a moderate demand for live at 6@8½c., the latter for near points; course heavy calves, 4@5c. Hog-dressed calves at Washington Market, fair to prime, 9@10¾c.

SHEEP AND LAMBS.—Receipts for the week, 19,013 head; do., last week, 18,485 do. Receipts continue light, but seem fully equal to the demand, the market, as a whole, seeming weak. Quotations for sheep, $5.25@5.75 ₩ 100 lbs. Lambs alone, 6¾@7¼c.

SWINE.—Receipts for the week, 31,408 head; do. last week, 31,112. The holiday of the 22d broke the regular buying, and there was no definite late prices for live. Country-dressed pork firmer now—State and New Jersey, 5@6c.; Western dressed, 4¾@8¾c.; city, 5¾@5¾c.

NURSERY JINGLES.

KISS OF THE RAIN.

PRETTY little rain-drops,
Laughing, kissed the daisy,
Dozing on its couch of green,
Oh, so hot and lazy!
Then the daisy upward sprang
And sang out so gaily,
"Kiss again, kiss again,
Rain-drop soft, I pray ye."

THE DICKEY BIRDS.

DICKEY-BIRD baby
In the nest sleeps,
Dickey-Bird mother
Watch o'er it keeps:
Dickey-bird father
Is the bread-winner—
See him fly home
With crumbs for a dinner.

THE END OF THE CANDLE.

CLEMENT SCOTT.

THE title of my story is suggestive, and I doubt not that it may appeal to boys' minds in various ways. Allow me, however, to preface my little annecdote with the grave assertion that what follows is connected in no way whatever with what, in schoolboy phraseology, is technically known as "a sell." I have been, thank goodness, a schoolboy myself; and I am happy to say that the old-fashioned tricks were, as they should be, played upon me in common with my fellow-creatures.

What I have to tell has, however, nothing to do with tricks in tallow or pilfered lights. My story treats of a real and *bona-fide* candle, not one of your modern composite inventions with a finely-tapered end patented and warranted to fit every conceivable candlestick, and a wick that never wants snuffing, but dies away into a dissipated flory end.

You must go back with me to the old days, when patent candles were not invented or thought of, and when a silver snuffer-tray and a pair of silver snuffers were brought in and deposited by the side of the tall candlesticks in great state. According to my present ideas of life, I don't think that I should consider Staunton altogether a lively place; but Staunton in the days when I know it was to me a paradise. My two maiden aunts, were exceedingly fond of their nephew, and as their nephew was not altogether a mischievous lad, and possessed the wonderful gift of being able to amuse himself, it need not appear extraordinary that the owners of a certain white-looking, clean mansion in Main Street of Staunton and the pale-faced visitor at the said mansion got on very well together.

My first insight into life and its mysterious ways, dates from my first visit to Staunton, where I was just as happy watching the market-carts come into town and put up at the "Tavern," over the way, as I was playing at stage coach, and every other conceivable variation of a coaching expedition, all by myself in a deserted outhouse, the only property to render me any assistance being a tumble-down and rickety old phaeton.

I had been a mild, docile lad, amusing myself in my quiet, unassuming manner, thoroughly contented with my own society and that of my respected aunts. Charley Clode was the means of revolutionizing my life. He had lots of adventures and tales to relate to me; he first fired me with the enthusiasm of public school life, told me of his adventures and deeds of daring, of the heroes of the school that he worshiped and the sneaks whom he despised; and altogether I thought Charley Clode a most enjoyable companion, and cultivated his society accordingly.

He was a capital fellow was Charley's father, and would often come out and have a turn with us at ball, or whatever game we might be playing. He was a doctor, and great at all sorts of experiments, with which he used to delight us in the evenings. According to Charley's account there was no one who could make such fireworks as his father, and though it was the wrong time of the year we were promised a miniature display on the lawn the very first dark night that came.

One evening—I shall never forget it—I was over at the Clodes' house, and the doctor, who had nothing particular to do, was working for us a little steam-engine he had lately made. The doctor had a workshop in the basement floor of the house; and adjoining this was a dark, gloomy-looking cellar, wherein were deposited all sorts of odds and ends—old empty bottles from the surgery, packing-cases, and rubbish of every kind. The workshop and its adjacent lumber-cellar had always been forbidden us boys, for the doctor rather mistrusted Charley's capabilities of resisting the fascinations of the lathe; and though not particularly tidy in his own work, had that peculiar method in his untidiness that he knew exactly where to lay his hands upon everything he wanted, and was by no means anxious that any of his work should be spoiled by careless handling or delayed by a sudden impulse of boyish mischief. On the particular night to which I am alluding, Charley and I were sent off from the drawing-room, in which the doctor's family was assembled, to hunt up the remains of an old tramway which the doctor had made years ago, and which was to be called into requisition on the special occasion on which the doctor had promised all of us that he would work the miniature engine on which he had expended so much time and trouble, in full assembly.

The wreck of the tramway was reported to be among the old lumber which lay in a helpless and confused mass in the dreary dark cellar which adjoined the surgery on the basement floor.

"We must get a candle," said Charley, "for it is pitch dark now, and we shall not be able to see a yard before us."

"All right old boy; but let us be quick about it, for your father seems anxious to work this engine, and all the ladies are impatient."

We made our way into the kitchen, and I don't think they were quite prepared for our sudden appearance or the energetic appeal Charley made for a candle.

In a little room adjoining the kitchen a maid was washing up plates and glasses by the light of the very smallest portion of a tallow candle, whose wick was at that moment of a portentous length, and dimmed considerably the uncertain rays which the candle threw upon the melancholy party.

"Here, this will do," said energetic Charley, seizing the scrap of candle, and, in his energy, extracting it from the humble socket which contained it. I really believe it was nothing more than a bottle. "We shan't be gone a minute. You can stay in the dark, Mary, until we return."

It was useless for Mary to protest, which she did emphatically, asserting that she would not allow the young gentlemen to go messing themselves over with all that nasty tallow. Charley would wait for no apologies; and thrusting the scrap of tallow-candle end into my hand, for he was guide and knew the way and the whereabouts of the article which we had come to find, he preceded me through the surgery into the deserted cellar.

Charley's search was not at first quite successful. I could do nothing towards assisting him, but stood patiently in the middle of the cellar with the scrap of candle-end gradually diminishing between my fingers, the wick getting longer and longer and the light more and more obscure.

At last Charley's voice spoke encouragement. My part of the transaction was not a lively one, and I felt particularly glad that we were not to return to the drawing-room discomfited. Boys don't like to be thought stupid, and to have returned to the doctor empty-handed would have been the signal for a volley of "chaff" from the doctor and a chorus from the expectant ladies.

"Here's the tramway sure enough," said Charley, from behind two old packing-cases, "but I can't get it out without your help. Just put that beastly candle down somewhere and give us a hand behind here."

Charley's request was easier made than accomplished. The "beastly candle," as he chose to call it, was naked and unprotected by any candlestick, and to keep the light in under these circumstances was not such an easy matter. We were not at all anxious to be left in the dark, which fate very nearly overtook us, for I made three dismal attempts at setting up the candle, and failed egregiously on every occasion.

Charley was getting impatient, and again summoned me to his assistance in authoritative tones from behind the large packing-cases.

A bright thought suddenly struck me. At my side was an open bag containing sand—at least, it seemed like sand to me; but I had no time to stop and examine its contents very closely. I plunged the candle-end into the sand, and to my joy I saw that it stood up firmly in its *impromptu* resting-place. But I could not help noticing that the wick had now got to an enormous size, and that at its end was an ugly fiery lump which threatened every moment to detach itself and tumble among the sand. I went to Charley assistance, and by dint of a good deal of pulling and hauling we managed at last to extricate the doctor's tramway from its obscure hiding-place.

We emerged from behind the packing-cases.

"Where did you put the candle?" said Charley; for the light had now got so dim that it was a difficult matter to see it at all.

"In that bag of sand."

"Bag of sand!—where?"

I went towards it. I heard a crash behind me. The tramway had fallen from Charley's shoulder, and I felt myself suddenly dragged back just as I had got within reach of the candle.

I heard but three words, and they were not spoken, but literally hissed into my ears.

"Sand! It's gunpowder!"

I very nearly dropped. That awful cold shiver which we have most of us experienced, ran all over me, and then I turned round and faced Charley. He looked like death, and a cold sweat was breaking out on his face. There was no time to be lost. An enormous blossom of red fire was now hanging to the charred wick, which any moment might fall among the gunpowder, and then it was easy to guess what would follow. There was enough there to blow up the house twenty times over.

"Does your hand shake?" said Charley. "Do you think you dare try?"

My nerve—I was very young, you must remember—was quite gone. I tried once, twice; and so did Charley; but we were both trembling in every limb. A nervous twitch of the hand would have destroyed every soul in that house in less than a minute. Charley had said rightly that there was no time to be lost. There was little good in our standing there looking at one another and waiting for death. That we were powerless to save another or any one, had been proved.

Charley was the bolder of the two; and luckily knew his way in the dark. He literally dragged me out of the cellar. I did not know where I was going, and expected that every moment would be my last. At last I heard him say:

"Mary! Mary! I say, look here! we've forgotten that bit of candle you lent us. You'd better go and fetch it now, or something or other may catch fire. Run along at once will you?"

Hand in hand we stood in the dark stone passage. Two minutes would decide our fate. It was decided in less than one. We were saved.

The servant knew nothing about the gunpowder, and so fearlessly approached it, snatched up the candle, and joined us in the passage.

It was a marvelous escape certainly, and the wonder of it was considerably heightened by our being told afterwards that the charred end of the wick did fall, but upon the floor, and within a foot of the exposed gunpowder. I think we both added a little warm boyish thanksgiving to our prayers that night. We are big boys both of us now, but I doubt if either of us will forget our adventure with the "the end of the candle."

THE FIGURE NINE.—A remarkable property of this figure is, that all through the multiplication table the product of nine comes to nine. Multiply any number by nine, as nine times two equals eighteen, add the digits together, one plus eight equals nine. So it goes on until we reach nine times eleven equals ninety-nine. Very well; add the digits, nine plus nine equals eighteen, and one plus eight equals nine. Going on to any extent it is impossible to get rid of the figure nine. Take any number of examples at random, and we have the same result.

LETTERS FROM BOYS AND GIRLS.

From Wild Fern.

Now, Cousin, let us give three cheers for "Rocky Mountain Joe," because he has so many virtues, also give him a vote of thanks for coming to the front so boldly, and setting other boys an example so praiseworthy. I do not mean that they should praise themselves, oh no! but to encourage them to be useful in and out of the house; and not to chew, smoke or drink. Boys, (I am talking to the sensible ones now), what if other boys do say that you are tied to "mother's apron strings?" It is an honor to be "mother's boy." You can look back in after years when she is no more and know that you did all you could for her.

"R. M. Joe" wants to know what I can do in the line of out-door work. I can sum up the work in a few words. I live on a farm. Some of the things I delight in are to fish, skate, and ride horse-back. I would like to correspond with "R. M. Joe." "Jumping Jack," I think it is real mean in you to excite my curiosity by wondering who you are? I thought you were a boy, but now I do not know whether you are a boy or a girl. I guess you are a boy. Are you as "us girls" say a college chap, or a Union School boy? What is your name? Echo answers what? "Ivy" said that *she* was somewhat surprised to hear that I thought she was a boy. Who would not think that she was a boy, when she asked so much about the girls? Will Uncle True be so kind as to tell me in what paper there is a premium list or where I can get one? Adieu. WILD FERN.

U. T. sends you a Premium List by this mail. You should make your offer of flower seeds in the Exchange, in another part of the paper. Please send it to the Editor.

The Puzzler.

MISCELLANEOUS ENIGMA.

I AM composed of 22 letters:
My 1, 18, 2, 17, 9 was lately fashionable.
My 13, 2, 3, 3, 12, 16 an article for the head.
My 5, 11, 18, 4 an article for the foot.
My 13, 2, 18, 10 also for the foot.
My 11, 2, 15, 14 articles of dress.
My 9, 6, 2, 18, 19 a sort of seat.
My 15, 21, 11, 2, 18, 19 a place of learning.
My 17, 8, 3, 4 a kind of tree.
My 10, 11, 20, 3, 14 a pronoun.
My 4, 7, 12 part of your face.
My 11, 12, 22 an interjection.
My whole is an old proverb.
☞ Answer in two weeks. FLORIDAN.

PYRAMID PUZZLE.

1. BEGINNING of man. 2. A crowd. 3. Malice. 4. A man's name. 5. To dread. Centrals form a State of New England.
☞ Answer in two weeks. LITTLE ONE.

PUZZLER ANSWERS.—Feb. 16.

GEOGRAPHICAL ENIGMA.—Pure love is immortal; springing up in time, it runs through eternity.

DOUBLE DECAPITATIONS.—1, Blend, lend, end; 2, Swear, wear, ear; 3, Slink, link, ink; 4, Sowed, owed, wed; 5, Frail, rail, ail; 6, Scare, care, are; 7, Cleave, leave, eave.

MISCELLANEOUS ANAGRAMS.—1, Metaphor; 2, Angle; 3, Parody; 4, Moss rose; 5, Arduous; 6, Arena; 7, Arid; 8 Anchor; 9, Arbiter; 10, Apron; 11, Demand; 12, Sword; 13, Spot; 14, Delicate; 15, Demagogues; 16, Aristocrat; 17, Deliberate; 18, Urchin; 19, Vowel; 20, Starch; 21, Stamp; 22, Staple; 23, Stanch; 24, State; 25, Stare; 26, Gnats; 27, Moose.

Sabbath Reading.

THE SILENT CITY.

WEARY of life and sad at heart,
From the world's highway I roamed apart,
Through wood and wilderness, far away,
Till near the close of the dying day
I came to a shadowy river side—
And the wailing water was wild and wide—
Where a black-sailed shallop bore me across
To the Silent City of Thanatos.

Oh, a singular city it is to see
As any that in the world may be!
And a strange community bide therein,
Unvexed by the mad world's fret and din;
For they dream no more, or know, for aye,
The cares that wither, the hopes that die,
Nor touch of sorrow, or pain of loss,
In the Silent City of Thanatos.

And the houses all are straight and low,
Where shoulder to shoulder sleep friend and foe,
And marvelous sculptures, white as snow,
Gleam in the moonlight, row on row,
And scored in the rock with curious care
Are the records of those dumb dwellers there,
Inwrought with hieroglyph, scutcheon and boss,
In the Silent City of Thanatos.

And the kings of the earth, though never so high,
With the vassal hither shall come and lie;
And the warrior, glutted with half the world,
Here shall find his banners furled,
And his arrogant armies come to halt
In the silent bivouac of the vault—
And pride and pomp be but as dross,
In the Silent city of Thanatos. [*Golden Rule.*

THE WEALTH OF OTHERS.

M. BARTON.

"LET no man seek his own, but every man another's wealth." Such is the injunction of St. Paul to the church at Corinth. It applies with as great, if not with greater force to each individual Christian at the present day. But how few are those who heed the wise counsel of the apostle in its widest and truest sense. How few really bring thoughts, words and deeds, character, influence, and life, to bear upon their neighbor's welfare; so much self-seeking of our own in all we attempt. Where is the spirit of the Saviour, who "pleased not Himself," but whose stay on earth was one perpetual sacrifice for the wealth of others? "Though He was rich, yet for your sakes He became poor, that ye thought His poverty might be rich."

How can we add to the wealth of others? Spiritually, first by the tone of our life and character. Let the happiness and beauty of obedience to Divine law shine out continually; this will tempt others to inquire into its cause and seek it for themselves. Let words follow deeds, not go before; let there be some likeness to our Master ere we make a profuse profession of the lip: this will speak plainer language than the tongue.

The Lord accepts the stammering accents which would say something for His cause. Who knows whether a right thought may not be stirred up in the heart of a brother or sister, or a worthy purpose strengthened, by even a simple expression? Let us commit the results of our words to God; we may wing the arrow, in His hands lies the direction of it. It is not uncommon to hear the remark, "Yes; he is a very good man, but very disagreeable." Why is this? Why do real Christians often adopt a harsh demeanor toward others? They can be right, yet not rude. Let us boldly set our face against anything that involves the sacrifice of principle, but yield minor points with gentleness. Be courteous; let the leaven leaven the whole man. Nothing is little that goes to make up character. We allow the grace of God to change and control our disposition, why should it be forbidden to refine our manner? "Glorify God in your body." "A soft tongue breaketh the bone." Let there be the utmost possible tenderness and forbearance in our intercourse with "those that are without."

Is it not true that we willingly or unwillingly, consciously, do effect a large and continuous influence on the minds, habits, and outward walk of those about us? The simplest thing may lead to great results. A look, a sigh, a touch may change a resolution. Some natures are so constituted that they yield at once to the subtle force of a strong character, and are led at will. Others resist and beat against the hand that would guide, thus bringing out their own independent strength, and in turn acting for or against the discipline of another. No act is without its consequences. What awful issues then may hang on the works of our hands and the words of our lips! Truly we have need to watch, and that continually, lest we should give the enemy an advantage.

Seeing therefore that "no man liveth to himself" alone, but that he wields a mighty power over his immediate circle, and through them to some extent on the world, it becomes an important matter to examine into the ways in which this rule is exercised, and whether it be his own or another's wealth he seeks to increase. Look at the price Jesus has paid: "ye were not redeemed with corruptible things," "but with the precious blood of Christ." By the costly outlay of his inestimable life He has long bought us altogether—our wills, our hearts, our whole beings—"that they which live should not henceforth live unto themselves, but unto Him which died for them." "Set in slippery places," we have often to contend against influences antagonistic to Christian profession and practice; hence must we be very careful here to maintain a firm front, and by every means put forth a resisting power which, while preventing ill effects on our own souls, shall also induce others to come on our side, won by our good conversation in Christ.

We have all experienced the power of a consistent earnest Christain on ourselves; how we aspire after the like peaceful assurance.

PERSONAL ITEMS.

It is said that Mr. Sankey learnt his free and easy style of public singing by selling a cure-all patent medicine in the streets of different places, attracting purchasers by playing on a melodeon and singing.

Riza Pasha, who died recently at Riza, was a thrifty Ottoman. During the Crimean war he drew the pay of an entire army corps, which never existed, and by that fine operation made ten millions of dollars.

The Duke of Edinburgh is now with the British Mediterranean fleet, and it is said has had the following put up in his cabin to check unpleasant references: "Please to remember that the Emperor of Russia is my father-in-law."

Colonel Ingersoll's nomination of Blaine, in the Cincinnatti convention, was the best investment of brains he ever made. It made a comparatively unknown man famous, and he now lectures for $20,000 a year, board and washing included.

Edmund Yates, the novelist and journalist, says that on the front of a house in Albert Terrace, Knightsbridge, London, has been recently painted in large letters, the inscription, "Naboth's Vineyard." The house is the residence of Mr. Charles Reade, the celebrated novelist, and the legend is supposed to refer to a prevalent idea that some one covets the site, desiring to pull down the dramatic novelist's modest tenement and erect a magnificent mansion.

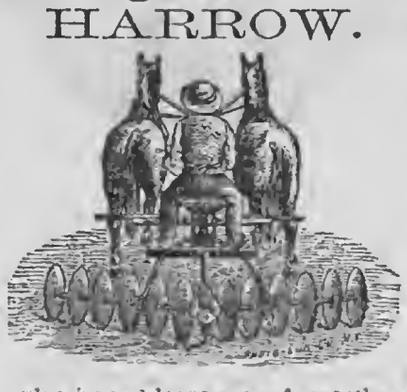
Implements and Machinery.

The THOMAS PORTABLE ENGINES are made to meet a want long felt by Threshers, viz., Lightness of weight, with strength and durability. They are the lightest made, and are guaranteed to do the same amount of work as those 800 to 1,500 pounds heavier, and with much less fuel and water and less amount of steam pressure. Nothing equals them. Send for Circular. Made by J. H. THOMAS & SONS, Springfield, Ohio.

LA DOW'S JOINTED

Pulverizing and Smoothing HARROW.

Light, Simple, Cheap.



Durable and Flexible.

Will pulverize and leave ground smoother and in better condition and cover seed better, by once going over, than twice with ordinary Harrow. Acknowledged the best in use. Being jointed in the center, it accommodates itself to uneven surfaces, such as dead furrows, ridges, &c. Made with both Chilled Metal and Cast-Steel Discs.

Responsible agents wanted where we have none. Manufactured by

WHEELER & MELICK CO., Albany, N. Y.

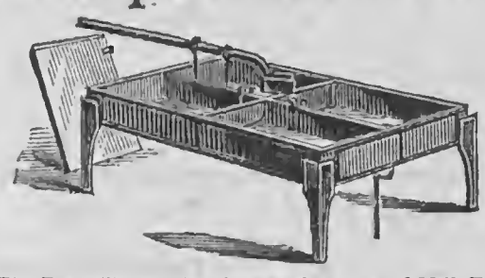
"GET THE BEST."
Highest Award at the Centennial!
THE IMPROVED BLANCHARD CHURN
PRICE GREATLY REDUCED

Perfect stock, best work, very efficient and durable. Nine sizes made, churning from one to 150 gallons. Warranted to be exactly as represented. Sold by all dealers in REALLY first-class Farm Tools. PORTER BLANCHARD'S SONS, CONCORD, N. H., Sole Manufacturers. Send for Circular.

CHEESE VATS.

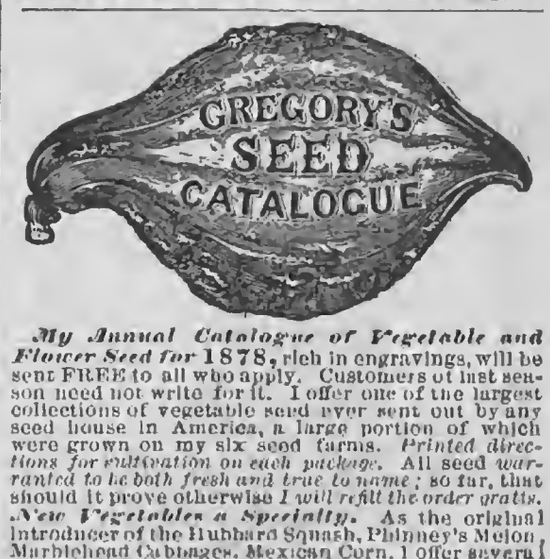
We continue to manufacture Steam Boilers and Engines and all kinds of Cheese and Butter-making Apparatus, combining the latest improvements. Send for Illustrated Circular and Price List.
CHARLES MILLAR & SON, Utica, N. Y.

Champion Milk Pan



The Best, Cheapest and most Economical Milk Pan in the Market. Saves the Butter Maker both time and money. Saves labor in handling the milk. Makes the best butter, and excels all others in durability and simplicity of construction. Illustrated Circular, giving full description of its working, sent free on application to WILLARD & HAMMOND, Randolph, Cattaraugus Co., N. Y.

GUNS and Revolvers. Illustrated Price List free *Great Western Gun Works*, Pittsburg, Pa



My Annual Catalogue of Vegetable and Flower Seed for* 1878,** rich in engravings, will be sent FREE to all who apply. Customers of last season need not write for it. I offer one of the largest collections of vegetable seed ever sent out by any seed house in America, a large portion of which were grown on my six seed farms. *Printed directions for cultivation on each package.* All seed *warranted to be both fresh and true to name;* so far, that should it prove otherwise *I will refill the order gratis.* ***New Vegetables a Specialty. As the original introducer of the Hubbard Squash, Phinney's Melon, Marblehead Cabbages, Mexican Corn, I offer several new vegetables this season, and invite the patronage of *all who are anxious to have their seed directly from the grower, fresh, true, and of the very best strain.*
JAMES J. H. GREGORY, Marblehead, Mass.

SEEDS.

All the leading and most desirable kinds of
VEGETABLE, FIELD,
AND
FLOWER SEEDS,
will be found in my new priced lists. Mailed free.
ALFRED BRIDGEMAN,
Broadway, cor. 18th St., New York.

THE THREE POTATOES

EARLY OHIO.—Earlier than Early Rose. Ranked by general consent, in earliness, yield and quality combined, at the head of all the early potatoes.
BURBANK.—Medium late; a prodigious cropper; flesh remarkably white; quality excellent.
DUNMORE.—A splendid late sort. A greater cropper than the Peerless, which it resembles in form, while far better in quality.
Each, per Barrel, $4.00; per Bushel, $2.00; per Peck, 75 cents.
My Illustrated Seed Catalogue *free* to all applicants.
JAMES J. H. GREGORY, Marblehead, Mass.

J. M. THORBURN & CO'S SEED WAREHOUSE
15 JOHN ST., NEW-YORK.
On application we send free of charge our new Catalogue of
VEGETABLE, AGRICULTURAL, FLOWER and TREE SEEDS.
Also *just published*, our New List of Gladiolus and other Spring Bulbs, containing also a list of Hardy Perennial Plants, &c., &c
SEEDS BULBS SEEDS.

TEAS REDUCED

OUR TERMS ARE THE BEST.
Send for our New Reduced Price List.

MARCH IN THE ADIRONDACKS.

The Herdsman.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

We threshed our oats and barley in the fall and had a huge mow of straw. In cold weather if stock are stinted in their food, they will eat straw with considerable greediness, but in a mild winter, like the present, when fed hay, although it may be a little, they will not eat straw. We took pains to cut our grain before it was fully ripe and were fortunate in getting it harvested without being rained on. This straw constituted an important share of the winter feed, and what to give it to during the weeks of mild weather, was a perplexing question. At last we concluded that the Jersey bull, two years old, must live on straw and the breeding mare too—not being in foal. We could not afford to keep the cows on straw nor would it be wise to confine the young stock to this diet. The sheep helped us out of our trouble. They would do well on straw if it should be supplemented with a little extra feed. In the morning their racks are piled full of straw which they pick over through the day. At night they are filled up again.

In the morning all this is cleared out and a liberal feeding of turnips is given to them the first thing and then the straw. Two weeks before lambing time, which is in March, we intend to give them daily a half pint each of oats with the turnips, beginning for the first few days with a gill. We have an idea that the straw and turnips are equal in nutritive value to hay alone—especially since we do not require them to eat the coarser part of the straw. The oats we think, will strengthen the sheep and help fill the udders with milk ready for the young lambs. If this is found not to be the case, then hay will be substituted for the straw, before lambing time. After the lambs begin to come, then we begin to feed hay, continuing the turnips and oats. If the sheep were required to eat all of the straw, it would take at least three times the bulk of straw to equal hay, that is, it would take thirty pounds of straw to furnish the same amount of flesh-forming and fattening matter which would be contained in ten of hay.

If the straw was unripe or damaged by rain, it would take a much larger quantity, probably forty or fifty pounds of straw. Straw is exceedingly variable in value for fodder. Bright oat or barley straw cut when the heads were just turning white, is, in our judgment, and an analysis ought to show it to be so, equal to coarse hay, or hay unripe, or hay which is black and damaged from being wetted. This is the condition of a large percentage of the so-called stock hay. A sheep could not consume such a large amount of straw or poor hay in a day, hence they should be allowed to select the best portions in which there is a larger per centage of nutritive qualities. It is true the turnips are eighty-five per cent. water, with less than ten per cent. of nutriment; but this watery substance is just what the sheep want to help moisten and help to assimilate the mass of dry food. Now, if our theory and practice prove successful, we have a home market for straw, and a place for sheep which are a blessing on any farm. A flock of sheep will always make a rich farm, and moreover they will keep it clear of weeds and bushes turning all such things into mutton and wool.

We have two young calves aged five and eight weeks, which are pictures of health and contentment. The milk of an Ayrshire cow is divided between them, and the oldest one, a Jersey, gets two handfuls of meal with each feed of milk. The other gets one big handful now, but will get two when he is a week older. We began with a spoonful to each when they were two weeks old. This was stirred into the milk. The meal is wheat bran and ground oil-cake, equal parts by measure. Milk is the most natural food for all young animals and contains all of the properties required for their growth and health; but when there is a lack of milk, then the most natural and healthful food for young calves is wheat bran and oil meal.

Our calves each have a warm woolen blanket served out to them, and are kept separate so they will not worry each other. A temporary partition was put into the ox-stall so they can play and see each other. They need exercise, and seeing each other makes them more contented. If you would have animals do well, let their *minds* be at rest. If they are homesick or lonesome they will not thrive. Our little pets get a regular feed of hay three times a day, and they expect it, a bright clover leek or a handful of nice rowen.

Corn and oats are now exactly the same price, a penny a pound. Which is the cheapest and best feed? That depends on what we want to feed. Corn contains eight per cent. more of fat forming properties, and oats ten per cent. more of flesh-forming elements. Oats have five per cent more of woody fiber and one per cent more of ash. This is because oats have the thickest hulls or skin.

To feed cattle for fattening and for milk, mixing these grains half and half would undoubtedly be the best. This would be a good combination for working horses, or for a horse it was desirable to put into good condition, as the excess of fattening matter in the corn would help to fatten him quicker; the more oats the better for a horse driven hard upon the road, as such a horse does not want fatty but flesh-forming food to make up for the waste which his service creates. Too much corn is not best for poultry. A portion of oats mixed with their food would be an advantage. For fattening hogs corn is obviously the best food, but for sows and pigs we want the flesh-forming qualities and here we must add oats liberally.

Barley is a stronger food than oats and contains five per cent more of fat-forming principles and three per cent less of flesh-forming. It has less ash and less woody fiber. It is the best grain to feed alone to make milk, owing to its constituent elements and their particular combination.

Buckwheat is not equal to corn in making fat by nine per cent, but in making flesh it is only one per cent less effective. It is good winter food for any store animals, especially pigs and cattle. It is good for colts, and most excellent for poultry. Both buckwheat and corn contain too much heat (carbon), which is involved in the fat-forming parts, to be suitable food in hot weather for any heavy feeding; or for animals which are worked or driven on the road.

The same is true of rye which is a stronger food than either corn or buckwheat, as it contains 69.2 of fat-forming properties, and 11 of flesh-forming. This is about one per cent more than corn. It has less woody fiber and this makes rye bran a very nutritive food. It contains three and a-half per cent more fat-forming principles than wheat bran and nearly three per cent less of woody fiber. More than one-half of both wheat and rye bran is fat-forming, and more than one-seventh is flesh-producing.

It must be borne in mind that in the processes of digestion and assimilation of food in the stomach, the relative chemical combinations change and the real value of no one kind of grain or roots can be actually determined by analysis. Roots, for instance, have an actual value as food far beyond the standard assigned them by the chemist. The wheat bran fed our calves has an important value not given by the analysis, as it helps to supply the waste material which is the woody fiber and ash absolutely necessary to feed the intestines, and make the necessary distension and action in them without which the animals would suffer. The same is true of oats when fed to a horse in such quantities that the animal does not partake of coarse food. Buckwheat bran is a valuable auxiliary in caring for stock because of its waste material which is just as essential for health as the concentrated food.

We can buy this at our mill for $16 a ton. We have been trying to determine which would be the most profitable, oats at $20 a ton, or buckwheat bran at $16. The value of the bran will depend on the amount of coarse flour in it. We like buckwheat bran for colts, and cows giving milk. It clears colts of worms and will induce a good flow of milk. An analysis of this bran will not determine its general value except of the sample analyzed. The miller does that. The finer bran is ground the better. The finer particles are more readily digested, and dissolved by the gastric juice.

DIFFERENT KINDS OF DUTCH CATTLE.

A correspondent in Jamestown, N. Y., asks to have the difference explained between the Dutch belted or sheeted cattle and the "Holsteins." Views differ somewhat, in regard to the origin and qualities of the cattle of Holland. The Dutch are excellent farmers and dairy folks, and such they have been for centuries. They have a breed of cows which is so good that there has been little inducement for them to go out of the country for fresh blood to improve them in dairy qualities. The so-called, *native* cattle of Holland are, as a general thing, black and white, although red and red and white ones occasionally occur.

There are many herds in which only black and white cattle are to be found, and in the breeding of which great pains have been taken for several generations. The characteristics of these cattle are as follows: *size*, very large; *aptitude to fatten*, good, exhibited in the "handling" qualities of the hide, softness of the coat and in the presence of fat in young females and bulls; *form*, symmetrical, on the whole, yet failing in some points regarded as important by Shorthorn breeders. *Milking qualities*, unsurpassed in absolute quantity of milk, which is of good quality. Fifty to eighty pounds of milk a day being about the range of the yield of good cows. It is a characteristic of the cows generally that they are very hard to dry up, and often never go dry, and that their flow of milk is not only continuous but very uniform throughout the grazing season. These and such are the Holsteins.

It is not claimed that the breed exists in its purity in Holstein—an ancient duchy subsequently a province of Denmark and now annexed to Prussia and the German empire—but the early importers of these well-bred Holland cattle to this country, learned of a tradition that a great improvement in the Dutch cattle was brought about, perhaps centuries ago, by the introduction of cattle from Holstein, so they gave them that name.

Many of the recent importations of cattle from Holland have not been made with great care in selecting, and the cows show it painfully in a lack of stature and symmetry. Nevertheless they are excellent milkers and much liked by those that have them, and are admitted to record in the Holstein herdbook.

BELTED OR SHEETED CATTLE.

These are a breed of Dutch cattle never called Holsteins, though for aught that appears to the contrary, they have just as good a right to the name. They are black and white also, but marked as if black animals had broad white belts or sheets around their bodies. All are not thus belted with white, but many are and these only are retained as breeders, hence the markings have become fixed. The Belted cattle possess many of the valuable qualities of the so-called Holsteins. They are of fair size, are very uniformly good milkers and make good beef; so that in usefulness they compare favorably with Shorthorn or Holstein grades. The interest in them depends upon the perfection of their markings. Those who have animals for sale of either of these breeds would do well to advertise.

Sheep Husbandry.

A NEW INDUSTRY.

Were our children, reared on the comparatively treeless plains of the West, transported to some heavily timbered country, they would study to utilize the straight shafts that are allowed to go to waste or are wantonly burned to make way for a coming crop. When a man comes to the West, much of whose life has been spent in Eastern towns the suburbs of which would seldom furnish even scanty pasturage for the family horse and cow, he is struck with the millions of acres of choice pasturage annually going to waste, and the query is: Cannot this pasturage be utilized?

It is believed there is capital enough in the East, earning but a low interest, to stock these plains with sheep. It is conceded that the United States furnish no better range for sheep than can be found in Kansas and Nebraska. Most of the sheep in the country are in the hands of wealthy stock-men, who own from 1,000 to 10,000 head. While I write, a "prairie schooner" (covered wagon,) is trundling by; behind it follow a few head of choice cattle. In this way, cattle are more evenly distributed than sheep. Yet among the settlers who have been a few years in the State, there is a feverish desire to possess a flock. This desire is based upon the fact that this country is naturally adapted to sheep raising. Iowa, Missouri and Illinois can surpass us in raising corn, perhaps Iowa can in wheat, though we are loath to own it, but this surpasses them as a stock State. We are too far from the seaboard to make grain shipping profitable; but we can advantageously pack our rich pasturage in wool-sacks for shipment or, better still, manufacture woolen goods here and ship our surplus ware. The world knows how droughths and "hatefuls" militate against grain raising but never check sheep husbandry; for grasshoppers do not eat grass.

Agricultural implements, from a plow to a harvester or thresher, are sold to our farmers "on time;" thus allowing the judicious farmer to avail himself of the best tools which are made, while they are paying for themselves. Sheep sold "on time" would be a more profitable industry, because:

1. It would not involve the outlay of so large a capital before a dollar can be had in return.

2. Machinery is liable to be superseded by "improvements;" nothing can supersede sheep for wool and mutton.

3. Machinery unsold at the end of the season, depreciates in value. Sheep unsold at the end of the season, can be gathered on a grand range and continually increase in value until the next selling season.

4. Drought and hoppers lessen the sales of agricultural implements, but would correspondingly increase the sale of sheep. A systematic purchase, importation, and sale would be the most economic way the homesteaders could procure sheep. The demand now is simply enormous and for the business man, with capital, there is an abundant harvest. R. H. Crane.

Harlan Co., Neb.

The Poultry Yard.

SPRING CHICKENS.

HENRY HALES.

As the spring approaches, the younger members of the farmer's family—if not, perchance, their mother—are laying plans for their annual employment—or rather enjoyment—of raising young chickens.

Remembrance of former years will bring to mind some individual hens that showed certain peculiarities; one did not keep steadily to her work of hatching; another, perhaps, broke her eggs; while others behaved so quietly as to allow you to lift them off the nest, examine the eggs, and replace them again, without any such annoyance as some that peeked at your hands till they tore the skin. Those that sat well, brought out the most chicks and took the greatest care of them, will be the first to have the privilege of sitting again, should they so desire; and the cross old hen that is suspected of killing other hen's chicks, will be shut up when broody, till she is cured of the fever. Then the eggs of those hens that laid best, must be saved to be set: also some of different breeds, to be compared for their special merits, not forgetting those of the strongest and hardiest of the flock.

Those who have many out-buildings, will bear in mind to put nests in quiet corners, so that their favorite birds may lay where they will want them to sit. This makes easy work for those who have to look after them; for a hen generally keeps well to the nest she has been accustomed to lay in, especially if it is in a quiet, cozy corner, that every hen cannot find out.

Do not allow the impulses of a few fine days, in very early spring, to lead you to set hens too early. This is a poor practice. April is early enough to have the chicks hatched out, as we sometimes have such cold weather in March, that it is a hard matter to raise chicks, unless they are allowed to get around a kitchen fire during stormy weather, and are put in a very warm place at night.

Unless you want a large proportion of cockerels, do not set all the largest eggs you can pick out. There are no means known by which the sex of eggs can, with certainty, be determined. Although many have thought some signs indicated the sex, yet, after repeated fair trials, all these indications have entirely failed with me, except the one which follows: with regard to the eggs of most of the feathered kingdom, if you pick the biggest out of a nest, they are the ones that generally produce males, especially if they happen to be the first laid. Even in a canary's nest, it is noticeable that the first egg laid is very often the largest; the young from it is the first hatched out; keeps ahead of its comrades; is the first to quit the nest, and the first to sing.

Industrial Topics.

NATIONAL AGRICULTURAL CONGRESS.

The session of the National Agricultural Congress was continued on Wednesday, and the morning meeting was occupied with discussions of the question whether four years was long enough to fit a young man to be a scientist, with part of the time devoted to manual labor. The discussion embraced the work and results of agricultural colleges and the training of farmers at these schools.

Col. Curtis of New York, led off with a sharp criticism on agricultural schools and contended that they were so conducted that they did not make scientific farmers or farmers of any kind, but rather perverted the tastes of the farmers' sons and sent them to the cities or failed to so unite manual labor and study that one should inspire the other, and both work together, the hands helping the brain and the brain guiding the hands. Hence, unless they changed their system they would really be a damage to the farmer rather than any benefit. He said much more in the same vein which called out forcible replies from Messrs. Warfield, Hoyt, Bland, Brewer, and Purnell, who were connected with various colleges. They contended that the agricultural colleges were yet in their infancy, and time must be given to allow them to remedy the evils which might exist. President Purnell, of Delaware, took the ground that it was absurd to expect any one school to attempt to teach everything; that colleges should be established with different aims and courses of study to accommodate the peculiar views and proposed avocations of all classes of students. It may prove a positive advantage, therefore, that so much diversity and contrariety of views have existed among the founders of these industrial institutions.

Prof. Brewer of Yale College said one difficulty was that boys come too young and too de-

ficient in the rudimentary branches which had to be taught in large part in the colleges, leaving but little time for the more practical education, and then boys did not see much attraction in digging ditches and hoeing potatoes. They could learn that at home; they came to college to learn science, etc., so it was very difficult to unite study and manual labor, notwithstanding the eloquent theories to which they had listened.

The next subject discussed, sheep husbandry and wool-growing, occupied an entire evening and was concluded on Thursday.

The following resolution was offered:

"*Resolved*, That sheep husbandry in the United States, with its products of wool and mutton, its value in fertilizing the soil, and its adaptability to every section of the country, is eminently a national industry. Its extraordinary progress in the last ten years justifies the national protection which has been afforded to it, and warrants the conclusion that no change in the revenue policy at present applied to this industry is demanded by consideration of national interests."

This subject was argued in a most exhaustive manner by Messrs. Cochran, of Virginia; Dean, of Maryland; Curtis, of New York; Colonel Aiken, of South Carolina; Beverly, of Virginia; J. R. Dodge, Agricultural Department; Klippart, of Ohio; Morton, of Nebraska, and Homes, of Virginia.

At the evening session the subject of inland transportation was discussed.

Senator Windom, of Minnesota, made the opening address. After ably discussing the general question of cheaper inland transportation, he announced his belief that transcontinental water transportation, by aid of Congress, was the only solution of the difficulty.

The Hon. Mr. Hayes, of Michigan, followed in a very exhaustive argument to show that the interference of the Federal Government for the regulation of commerce between the States, was an absolute necessity and the only mode of breaking up railroad combinations and the exorbitant local freights now exacted of the farmers of sections of the country who now raise produce for which no adequate remuneration could be secured.

The Hon. Mr. Elliott, a member of the Agricultural Congress, scouted the idea of Government interference as not only an invasion of State rights but a virtual adoption of a system of parentalism, which should be left for countries under kings and emperors, because contrary to the spirit of our Government.

Hon. Mr. Dorr, of Illinois, sustained the general views of Messrs. Windhom and Hayes.

The following resolution was offered:

"*Resolved*, That the subject of inland transportation, the cheapening of freights across the coutinent, for the relief of consumer as well as producer, demand the intelligent, prompt and efficient action of the Congress and people of the United States."

Hon. Mr. Reagan, of Texas, also spoke on this subject. While opposed to subsidies as granted to railroad monopolies, he was in favor of a subsidy for the general benefit of the people.

The Hon. Mr. Aiken, of South Carolina, spoke in favor of the resolution, and was strongly against governmental subsidies to railroads, and said he should not object to a few millions to be expended for the recuperation of the South.

The pending resolution was then adopted.

Professor Brewer, on behalf of the business committee, submitted resolutions of thanks to Mr. M. C. McDonald, of Willard's Hotel; to the committee on arrangements and reception; to Messrs. J. R. Dodge and Thomas B. Bryant for their labors in behalf of the Congress; to the railroads; to the press; and to those members of the United States Congress who took part in their discussions; also a resolution of heartfelt sympathy to their honored president, Mr. W. C. Flagg, hoping for his speedy recovery.

INTER-STATE COMMERCE.

Mr. W. W. Fields, of Wisconsin, presented the following resolution, which was adopted:

"*Resolved*, That it is the sense of the National Agricultural Congress that the National Government ought to control inter-State commerce, and we respectfully urge Congress now in session to take this matter into consideration."

Mr. G. L. Binghampton, the secretary, was authorized to correspond with the Ministers of Agriculture of France, Holland, and Germany, and ascertain in what particular manner the governments render aid to the agriculture and the mechanical arts.

The committee nominations made the following report, which was adopted: For president, W. C. Flagg, of Illinois; vice-president-at-large (who shall be president *pro-tem*). Dr. Thomas P. Dean, Georgia; vice-presidents, J. M. Pugh, Ohio; J. Merimon, Maryland; Professor Brewer, Connecticut; W. H. Pomell, Delaware; F. D. Curtis, New York; D. W. Aiken, South Carolina; R. Beverly, Virginia; W. W. Field, Wisconsin; Colonel W. P. Adair, Indian Territory; assistant secretary, J. M. Ream, Virginia; secretary, J. Perian, Illinois; treasurer, E. Whitman, Maryland; executive committee, W. C. Flagg, J. Periam, and E. Whitman.

Professor J. D. Warfield offered the following resolution, which was also adopted:

"*Resolved*, That this body hold semi-annual sessions; and that when we adjourn it will be to meet in New Haven the last Tuesday in August.

The above report is only of a part of the proceedings, but that is the most important part.

The Forestry convention met at Washington Feb. 26th, when Mr. J. A. WARDER, of Ohio, the President, delivered an interesting address on forestry and its needs. Essays were submitted by J. C. NEALLY, E. K. PRICE, and Mr. THOMPSON, respectively on wintering of fruit trees, sylviculture and forestry. The society closed its meeting on the 28th by the adoption of the following memorial and the appointment of a committee, consisting of Professor Brewer of Connecticut; Dr. J. A. Warder, Ohio; and Mr. J. A. Saul, District of Columbia, to present it to the United States Congress:

"That the subject of forestry and tree-planting in all their bearings upon timber production, water supplies, and climatic influences, is a matter of vast importance to the future of our continent.

"Those of us who have at all considered the subject realize how sadly this branch of agriculture has been neglected in our country, and we feel the necessity for immediate action, and for the fostering aid of the General Government. Moreover, those of us who have already made some advances in the great work of foresting the lands that have been stripped of their primeval covering of trees, as well as those of us who are making attempts to clothe with woodlands the open prairie regions of our vast interior basins, all alike, are fully impressed with the magnitude of the undertaking, and are discouraged by the ignorance which, unhappily prevails among us, as to the best modes of procedure necessary to bring about the most satisfactory results.

"We have full faith in the talents and ingenuity of our fellow-countrymen, and believe them capable of solving any problem that may be presented for their solution, be it even so great a one as the production of the woodlands, that are now so nearly destroyed, and the development of an enlightened system of forestry, adapted to our continent. It is believed that it may be possible to change parts of our country now treeless and arid into regions of trees and water-courses, thus providing for occupation by a teeming population. Still we are convinced that unless aided by Government the solution of this forest problem will require a century or more for its completion, in the results of the necessary experiments that must be carried out, and the country, in its threatened needs, cannot afford to wait so long.

"But we also feel assured that the centuries of observation and practice, which have been devoted to this subject in Europe, have already educed systematic and successful results, in the broad areas of those countries where forestry has been most carefully studied and practised for so great a length of time. From this rich treasury of facts, and the principles deduced therefrom, we feel confident that much may be advantageously drawn for the benefit of our country."

"We therefore respectfully beg of you to take such action as may be necessary in the premises; and, that without unavoidable delay, you will liberally provide for the means of sending a commission to observe carefully and fully to report upon this subject in all its bearings, for the benefit of the agriculturists and other citizens of our land."

The Association then adjourned, subject to the call of the chair.

Field Crops.

PRICKLY COMFREY.

In a late issue you open your columns to the discussion of the value of Prickly Comfrey by persons having practical knowledge of it. Induced by reliable English and French authorities who strongly recommended it as an unrivaled food-producing plant, I purchased a number of roots for the purpose of exact trial as to what they would do in this country. About the first of July my plants were fairly growing, some of the leaves being six inches or more above ground. Some time after this, I began feeding cows and horses with it. At first they refused the food, but on running it through a cutting machine and adding a little corn-meal, they readily devoured it and in two or three days they all greedily ate it as cut from the roots. Pigs and sheep in pens ate it readily without any coaxing. Indeed they grew so very fond of it, that after a few days they preferred it to clover. My poultry also became fond of it just as soon as the sheep. It will therefore be valuable in poultry yards. I judge fowls would get one-half of their subsistance from it.

In respect to its growth, my experience is this: I cut one plant at the middle of September, and in exactly 30 days afterwards, I cut again and weighed the leaves, finding them six pounds. This from one plant only! One acre will take 4820 plants, set three feet apart, therefore at the same rate, an acre in thirty days would yield over fourteen tons! It is asserted by European growers that it will spread its roots (not runners or seed), so as to entirely fill all the space between the plants in about two years. This food-plant I consider of great importance to the agriculturist, as it is so productive under widely varied climatic conditions. The roots will endure the winter frosts but the leaves were singed when only half an inch of ice was made. Probably a little more cold would kill the leaves, but in some mild days and nights of December the leaves started and grew three or four inches, thereby showing it will give food early in the spring. Those who live in towns and have only a very limited space available for vegetable growth, would be able within a few square yards to grow enough Prickly Comfrey to keep a cow, pig, or even a horse, and to supply a large part of the food needed by poultry, and a careful return of the manure would permanently maintain the productiveness of the soil.

I hope if any of the readers of the RURAL have had experience of this plant adverse to that above stated, they will kindly give the result of their trials, so that a wider experience may be attained; but I hope in such case the writer will add to the value of his report by subscribing his name and address. G. A. WILCOX.

Gasport, N. Y.

No contribution is ever admitted into the columns of the RURAL unless its fidelity and originality are vouched for by the name and address of the writer. For various reasons, however, the Eds. do not always deem it advisable to publish these, although always rigidly requiring that they should be furnished as guarantees of good faith.—[EDS.

Farm Economy.

IRON HURDLES ON WHEELS.

THE papers and Mr. MECHI of Tiptree Hall celebrity, himself, tell us that for making fences and folds so that his stock might feed on his crops where they were grown, he uses iron hurdles on wheels so that they can be easily moved. It is probable these hurdles, with or without wheels, would be cheaper for a number of years than any other kind of fencing, and if so, how very convenient it must be to have a good stock of them ready to make a division wherever desired or to make pens for sheep to be kept from ranging into mischief!

If these hurdles are painted green they are invisible at a distance, and the fields in front of any gentleman's house, can be made to look like a very large park; and if this were done in Orange County, N. Y., where so much is grass land; what a picturesque scene would be presented by a herd of dairy cows, a fine stud of horses, and a numerous flock of sheep, all in view at the same moment and apparently all in the park! Yet this park might be in four equal divisions and the aforesaid hurdles would be there though entirely invisible.

In Orange County, which is a great horse and milk-producing district, such a disposition of grass land would be particularly suitable, because the cows could be the leading grazers. Say, for instance, there were thirty acres in each division, or say any other number more or less—Well! the cows are turned into No. 1 lot, on the 1st of May, and on the 8th they are moved into No. 2, and the horses are put into No. 1. Then on the 15th the cows go into No. 3, the horses into No. 2 and the sheep, which perhaps have been on some mountain run or elsewhere, are put in No. 1. Now, after this in regular rotation they need not be moved oftener than in two weeks, which will give the cows a two weeks' growth of grass after the sheep have been periodically moved. For if there are four lots and only three of them stocked, while the animals are shifted round as stated, when the cows are in No. 4, the No. 1 lot will have nothing in it, and young grass will have two weeks to thicken up among what the sheep had not eaten, and all the bare grazed portion of the surface would have two weeks' nice sweet herbage for the cows, and every man of experience knows this would make a great difference in favor of milk. There is nothing interferes so much with dairy cows giving a great flow of milk as to have other animals besides themselves grazing and picking out the best grass, as sheep and horses will do; for they have more time to do it and their mouths can eat nearer the ground where, in a good old permanent pasture, all the thickset, juicy herbage is. This can be done well enough without iron hurdles; but on some of the beautiful farms it would be very pretty if done as stated.

Hurdles, if kept in sufficient numbers, and with them some easily movable contrivance to give shade in summer, could be used so as to supersede the soiling of animals, by having them at the homestead and hauling home crops and hauling away the manure afterward. Crops of rye, clover, millet, sowed corn, rape etc., could be folded off and the crop mowed daily or two or three times per day, and given to them in any kind of rack found most convenient. This is done on many farms in England with sheep, but if hurdles were made heavy enough, cows or stock of any kind, could be penned over the crops in a similar manner and the moving of the hurdles and the means of affording shade would not be more trouble than hauling home the crop. Moreover, there would be a clear saving of the labor necessary in cleaning out manure and taking it into the field, as it would be dropped regularly over the ground where the crop grew.

There is no doubt but that this kind of soiling will be adopted through a greater part of the year at the North and the whole year round in the South within another century, because no other system will renovate the land so well and economically and cause it to bear full crops. The consumption of a crop of clover or of any crop in this way, has the advantage of preventing waste by the stock treading on and injuring the herbage, while it saves the full quantity of urine, too much of which is lost at a farm homestead.

Any American gentleman, in order to fully appreciate the merits of this hurdle system, should see the very fat sheep to be met with in England, in the spring, after having been folded all winter without any shelter or anything but their wool to protect them. But, putting the advantages of all this on one side, look at the pleasure of being able to start a team and two or three men to fence off any portion of a farm in a few hours, without the necessity of digging any post-holes, or chopping rails, or the fear that rotten rails will let the cattle into valuable crops. Then, again, if iron hurdles are used, what a satisfaction to know alternate wetting and drying etc. will not hurt them, and that when once paid for there will be no further call for buying others to replace worn-out ones.

In a few more years, wood in the United States will be scarce and, as there is iron in extraordinary bulk in every direction, iron fences, iron gates, and iron hurdles, iron implements etc., will make repairing a much less annoying nuisance hereafter than it is at the present day. There is still another superiority in iron for fencing—it cannot be burned. And in the vicinity of water or on land that floods, it will not swim away. GEO. GARDNER.

Farm Topics.

BAD ROADS.

PROF. A. W. MANGUM.

AMONG the very few Latin words planted in Britain by the Romans, in their first invasion, was *strata*, from which comes our word *street*. The Romans made *roads*, called *strata*; and these roads proved so lasting and convenient that they held their name through all subsequent changes and convulsions, and transmitted the word through the centuries to the present. They were a wise and enduring product of advancing civilization. Roads have always been a criterion of the progress of a people. The railroad is the fruit, the friend and the inspiration of advancing art and science. But with all the facilities of transportation and travel which steam-cars and their allies, the steamboats, furnish, there has always been, and will continue to be, great need of the slower vehicles drawn by animals. The railroads are, in most cases, absolutely dependent on the country roads. What freight train ever moves a burden that is not, directly or indirectly, the result of work with carts and wagons? And what train does not need to be aided by these humble vehicles, before its stores can reach those to whom they are sent?

Not only the convenience but, to an appreciable degree, the profits of the producers in our country are affected by the character and condition of the roads that lead to the market. Comfort, pleasure, clothing, from hat to boots, oxen, mules, horses, all kinds of private vehicles, precious time and golden opportunities are all, to some extent, dependent upon them. Notwithstanding all these considerations, the country roads in many parts of even some of the old and thickly-populated States, are in a miserable condition. I have known a road within less than a mile of the capital of a large State, not only dangerous, but almost utterly impassable by any kind of conveyance. And that road was an important channel of supply to the market and

trade of the town. This is, probably, not an extraordinary case. The much-traveled roads are, no doubt, very bad throughout a large part of our country in the winter season. Those that are used most are, singularly, permitted to fall into the worst condition. How often do merchants sit and vainly watch for customers, and heads of families groan over scanty supplies in market stalls, while the farmer impatiently looks at his ready produce and hopes for the day when King Mud shall raise the siege of the inaccessible village or town! Only think of the spattered, panting, overstrained horses; of the muddy boots, soiled garments and lost patience of the sorely-tried wagoner; of the miring and prizing, the whipping and stalling, the turning over and the breaking down!

How are we to account for the continuance of those things—those reproaches upon civilization—from generation to generation? It appears to be an inherent peculiarity in man to neglect the roads over which he knows he must travel. That peculiarity is aggravated by general custom among all classes of people. Everybody who travels complains of the roads in his own neighborhood; but how few are willing to act sensibly and faithfully in improving them? In at least some places, all that "the overseer and hands" desire or intend is to escape prosecution and fines. As a term of court approaches, they pretend to "work the road." And what a work! Sometimes a little earth or even mud is thrown into a mud-hole, for the first wagon to cut out—perhaps a few pieces of brush being put in the hole. To prevent washing along the route, ditches are opened diagonally, and the dirt piled so high that the horses, the vehicle and the backbone of the traveler must all be subjected to a severe trial at every crossing. These barricades are sometimes placed on the very brow of difficult hills. Rocks, roots, stumps are left in undisturbed possession of their places directly in the road for years. Surely *ignorance* must be regarded as one explanation. The progress of the age seems to have no effect in many localities. The people work the roads simply as their fathers worked them. It is rarely that any jurors present the responsible parties—although the judges so often charge them directly upon the subject. Their observation is dull, or their memory is short, or they can't tell when a road is neglected, or they may have consciences that need sharpening.

In all the bad portions of the road, common sense would convince a man that it is necessary to raise the middle and open a channel for the water on the sides. A rolling road becomes firm and remains so.

It would work well for all, if it should become general, to utilize the muscle of convicts in every county, by making them work the roads. If there be those who, for any reason, ought not to be thus employed, let impartial discretion exempt them. There are at least some classes of convicts who ought to be thus made to contribute to the welfare of the people who are supporting them. But there is need, in any event, of securing the services of more competent "overseers" of those who do the work. As a rule, the most intelligent do not give their attention to the matter.

But I will not carry the reader further on "bad roads."

Floricultural.

WATERING PLANTS IN POTS.

WILLIAM FALCONER.

Nurserymen and florists who grow Polargoniums, Roses, Verbenas, Carnations, and the like by the thousand or hundred thousand, may water them overhead and irrespectively from the garden-hose, because it would not pay to use the watering-pot; but the amateur who grows only a few plants cannot afford to have some of them drowned or parched, hence he supplies their wants individually from the pot. Grass, and the common herbs of the field are indiscriminately showered overhead from heaven but the trees though similarly treated, teach us a mighty lesson: Instead of the water that descends on them being equally deposited on the ground underneath their branches, it is warded off so far as the branches extend, and falls, not at the base of the stem, but where the rootlets exist; and this is a chief cause of arboreal longevity.

It is most injurious to any kind of plant to water it, time after time, right on its crown or to direct the stream of water against its stem, thus laying bare the roots and making a hole in the middle of the soil in the pot, just at the stem. If we notice the position of any permanent plant, as a tree or a shrub, growing in the garden, field or wood, we will find that the stem rises from the ground on a little hill rather than from a basin-shaped hollow. After plants are freshly potted, and in the case of seeds and young cuttings, water should be applied over the whole surface of soil, through a rose, but when the soil gets compacted, the water may be poured on without the rose, keeping the water-pot near the flower-pot, around the inside edge of which the libation should be applied—never in the middle.

Soft water, as that from pond, river, stream, or tank, is the best for plants, yet some as nice window plants as I ever saw grown were fed from a well whose water was "hard." Water to be applied to the roots should be about the same in temperature as the atmosphere of the house or room in which the plants are grown, but while active growth is being made the water may with impunity be a little warmed, and again while the plants are at rest, water a little colder than the atmosphere won't hurt them. At any rate the water of equal temperature is always the safest. Don't water a plant till it needs it, and then give a plenty, that is, fill the pot to the brim, but if that be insufficient to moisten the whole ball of earth, give more. If the plant is somewhat moist but not enough so to do without water till next watering-time, then give it a lesser quantity than you would to a dry plant. Dribbling, or in other words, giving a little drop every day to every plant, is miserable practice, by which wet plants are made wetter or sodden, and dry ones don't get enough.

The syringe is used to bedew plants and thus refresh their herbage and incite growth, as well as to cause stems or branches to "break equally, and for this purpose it is employed daily in fine weather in spring and early summer. Later on, it is brought into requisition, less frequently though, as a cleanser from dust and insects. In dull or wet weather, except in exceptional cases, the syringe should not be used. In syringing instead of showering the water so as to wet the surface of the leaves, I direct it up through between the branches and against the underside of the foliage, thus more effectually dislodging vermin. In spring and summer the water used in syringing may with benefit be a few degrees warmer than that applied to the roots, but in fall and winter it should not be so. Plants should not be syringed while the hot sun is blazing on them, nor should they be done so late in the afternoon or evening, that they might remain wet all night. The proper time to syringe unshaded plants is at or soon after sunrise in the morning, giving ventilation enough to prevent burning the leaves; or when the sun's heat is on the decline, say three to five o'clock in the summer time, so that all may be dry before night.

More plants are killed by bad watering and over-watering than by anything else. When a plant becomes sickly, inexperienced growers usually "cure" it with more water, when in fact, they kill it. If you are satisfied that your plant is suffering of drought, then water it, giving enough to moisten the whole mass of earth, and if you be not confidently sure that the earth is entirely wetted, place the pot for a few minutes, an hour or two, or even a night if need be, up to its brim in a bucket or tub full of water. But if your plant be sick with the "well, I don't know what is the matter with it" disease, then keep it dry. And it is a frequent occurrence to give manure water to a sickly plant, but this "cure" is to the plant, as a Delmonico's dinner would be to a person sick of typhoid fever.

Manure water is an excellent stimulant to healthy plants, but should never be applied to those that are sickly. Neither should it be given to newly-potted plants, to those whose pots are not well filled with roots, nor to plants that are in a dormant condition. Soft-wooded and gross-feeding plants as Cinerarias and Calceolarias love it, but hard-wooded kinds like Camellias and Myrtles, though they like a tasting, are safer without its aid in the hands of most amateurs.

As some plants require to be kept moist all the year round, others only a part of the year, and some grow in the summer and rest in the winter, others grow in the winter and rest in the summer, and too, as plants grown under different conditions often have different tastes, I will refer to this subject in another paper, perhaps next week.

EVERGREEN SHRUBS (Mahonia and Leucothoe.)

The other day, in the gardens of John C. Gray, Esq., at Mount Auburn, near Boston, I noticed the following two evergreen shrubs in very fine condition. They are big bushes, very thrifty, and growing in a mixed border along with Lilacs, Mock-oranges, Rhododendron maximum and others, and quite unprotected by mulching or otherwise. In this way they undergo our more than zero winters, and with their shining metallic-green persistent leaves, make winter's garden enjoyable. Not only are they ornamental as evergreens, but both are comely flowering shrubs. Their hardiness we have proved in the gardens here, and our plants are much smaller than Mr. Gray's.

The Mahonia or Holly Barberry (Berberis Aquifolium) is a beautiful shrub some four feet high, a native of Oregon, and as an established plant is quite hardy at Boston. It has large shining pinnatifid leaves, and a dense crop of clustered racemes of yellow blossoms that appear in May. B. repens from the Rocky Mountains, is very like the other, but it is much shorter-growing and I believe hardier.

Leucothoe Catesbæi is an evergreen bush of the Heath family, a native of the Southern Alleghanies and the moist banks of streams in their vicinity, and, apparently is perfectly hardy in Massachusetts. It has arching branches, four feet long and over, and ovate-lanceolate taper-pointed leaves, and a wealth of little racemes of white flowers arranged along the under side of the branches in Soloman's Seal fashion, and which though budded in fall like an Andromeda, do not open out till the succeeding May or June.

Botanic Garden, Cambridge, Mass.

Dairy Husbandry.

INFLUENCE OF CONSUMPTION OF WATER BY COWS ON THEIR YIELD OF MILK.

C. G. King.—Will the Rural please explain what influence, both as regards quantity and quality, the amount of water drank by milch cows has upon their yield of milk?

Ans.—Experience has told not only practical dairymen but every observant cow-keeper, that when cows are fed on a diet containing a good deal of water, their yield of milk is larger than when their food contains but little moisture; and every summer furnishes a multitude of instances proving that cows shrink rapidly of their milk in dry, hot weather, when water is scarce and the animals do not get their usual supply. But although it has long been known that an increased secretion of milk follows the consumption of an unusually large quantity of water, it has been very often assumed that a thinner and poorer quality of milk is then produced, and that the increase in quantity consists disproportionately of water. The experiments of Dancel, however, as communicated to the French Academy of Sciences, repeated and extended with greater precautions by Stohmann, go to prove that this assumption has but little foundation in fact.

Dancel states that when he gave cows from 20 to 25 litres of bran mash instead of the corresponding amount of dry bran, the animals still drank the usual quantity of water and gave from 14 to 16 litres of milk per head instead of the ordinary yield of from 10 to 14 litres, without any depreciation either in the quality of the milk or in that of the butter made from it. Similarly, by inciting the animals to drink large quantities of water by the administration of salt, an increased secretion of milk was produced, and milk that was yielded under this water regimen, having been carefully analyzed as to its chemical and physical properties, was declared to be of good quality—a decision confirmed by the excellent butter obtained from it. It was Dancel's opinion that on observing the relative appetites for drink in a number of cows, and the quantity of water usually consumed by each member of a herd in the course of twenty-four hours, and comparing this quantity with that of the milk produced, the inference is inevitable that the yield of milk is in direct proportion to the quantity of water absorbed. His experiments, however, were not conclusive as to whether this increase in quantity was at the expense of its quality, as he made no special examination of it with a view to determining this point.

It was reserved for Stohmann, by experimenting upon goats at Halle, to afford clear proofs that an increased supply of water is followed not only by a larger yield of milk, but also by an increase in its dry constituents. Morever, at the same time he took note of the influence of an extra supply of water on the bodily conditions of the animals. From an analysis of the increased yield of milk produced under the stimulant of an unusually large consumption of water, the appetite for which had been artificially provoked, as well as from the quantitative determination of its constituent parts, it appeared that the increased secretion was not due to an unusually large proportion of water contained in it, but to an actual increase of all its constituents. In other words, the composition of the extra large quantity of milk yielded in the three days during which the experiment lasted, corresponded almost exactly with its composition immediately before and immediately after.

The experiments proved, however, that if attempts are made to increase the secretion of milk by increasing the supply of water, an increased consumption and digestion of food must also be insured; otherwise the enlarged secretion will take place at the expense of the whole system; the animal will soon fall off in condition, and consequently will, ere long, cease the increased yield, however much water may be given. In this connection Stohlman says:—"An increased consumption of water favors the secretion of milk, but is unfavorable to fattening; the production of milk requires a large conversion of albumen, and everything that increases such conversion counteracts fattening." During the experiment, an increase of water and consequently of milk caused an increased destruction of albumen; for the goat eliminated in her urine considerably more than the usual quantity of nitrogen, while more fæces were also excreted and she daily lost weight at the rate of 44 grammes, while ordinarily on similar solid diet, she gained from 60 to 90 grammes of flesh. In the case of pregnant animals the effects of a stimulated consumption of water, without the absorption of a corresponding supply of nutritious food, may be still more prejudicial, since the conversion of the nitrogenous constituents of the body into milk or urine must deprive it of much of the substance necessary for the development of the fœtus.

It must be borne in mind, however, that the quality of water sometimes has considerable influence on the yield of milk. Water foul with decomposing organic matter, may injure the general health of animals, and so decrease the secretion of milk; while water, in itself harmless but possessed of a disagreeable taste, often acts injuriously on the yield of milk, because the animal will not drink a sufficient quantity of it to promote a full lacteal secretion. Partly for the same cause, water whose temperature is too low, is apt to reduce the yield of milk, because cows will drink only a very moderate quantity of it even when specially thirsty, while the process of digestion is retarded by the introduction of very cold water into the stomach. Experience goes to prove that the best temperature of water for stock, is that which is pretty uniformly maintained in a well of moderate depth.

From these facts practical dairymen, and indeed, all interested in domestic stock of all kinds, should draw the lesson that cows and other animals, to yield the best returns, must be provided with an abundance of pure water, easily accessible at all times. Dancel's opinion may also be, as a rule, accepted: that the quantity of drink habitually consumed by a cow is a valuable test of her worth as a milk producer; and hence, that an animal that generally drinks an unusually small quantity of water—say 27 quarts per day—is necessarily a poor milker.

Miscellaneous.

CATALOGUES, &c., RECEIVED.

We have to thank Mr. Wm. H. Carson, the enterprising seedsman of this city, for a large package of many kinds of seeds for the field, vegetable and flower garden, among which are a number of novelties of much promise.

Hoopes, Brother & Thomas, Cherry Hill Nurseries, West Chester, Pa. A hand-book of green-house and bedding plants, embracing descriptions of the most popular plants grown under glass, to which is added the novelties for 1878.

We are always glad to call the attention of our readers to the excellent catalogues of this trustworthy establishment. No. 4, now before us, contains 57 pages, printed upon tinted paper and well illustrated. Also, price-list of evergreens and fruit trees at "panic prices." Sent free to applicants.

George Such, South Amboy, N. J. One of the best though most unpretentious catalogues we know of. It contains a long list of Gladioli, a specialty with Mr. Such, and a rare collection of choice plants.

Among those to which we would call particular attention are the following: Hardy Ghent Azaleas; Abutilon "Rosy Queen;" White Hydrangea "Thomas Hogg;" Hydrangea paniculata grandiflora; the new double white Violet "Belle de Chatenay;" Enlalia Japonica zebrina; Cannas, an excellent collection of named varieties.

D. S. Marvin, Watertown, N. Y. Price-list of grape vines, &c. Single vines are offered, of all good varieties, for from 25 cts. to $1 each, and at proportionately less prices by the dozen, hundred and thousand.

Mr. Marvin gives the species from which the varieties have been obtained, not all of which are in accord with other authorities. Autuchon, e. g., is from Aestivalis and Vinifera, not from Vinifera and Cordifolia as he states. Mr. Marvin is much opposed to crossing V. vinifera with our native varieties.

E. & J. C. Williams, Montclair, N. J. Descriptive catalogue of small fruits, grape vines, &c., for the coming spring. Here we find the latest varieties of strawberries, such as Great American, Beauty, etc., etc. Also, a list of the best grapes.

For the convenience of those having new places, this catalogue gives an excellent list of Strawberries, Currants, Grapes, Blackberries and Raspberries. It will be sent free to applicants.

Carrots, Mangel-wurzels and Sugar Beets. How to raise them, how to keep them, and how to

feed them. By J. J. H. Gregory of Marblehead, Mass. He who wants practical and trustworthy information respecting the above-mentioned roots, will find it in the above work of 62 pages Price 30 cents.

John Lewis Childs, Queens, N. Y., Catalogue of Half-dime Packets of Flower Seeds. Also price-list of Bulbs and Plants for 1878.

Gould Brothers, Rochester, N. Y., Wholesale Catalogue or Trade List of the Monroe County Nurseries for Spring of 1878. The following Catalogues will be sent, prepaid, on receipt of postage stamps:

No. 1—A Descriptive and Illustrated Catalogue of Fruits, 10 cents.

No. 2—A Descriptive and Illustrated Catalogue of Ornamental Trees, Shrubs, Roses, Flowering Plants, Bulbs, etc., etc., 10 cents.

No. 3—A Wholesale Catalogue, or Trade List, free.

R. H. Allen & Co., 189 and 191 Water Street, N. Y.—Catalogue of choice farm, garden and flower seeds, Roots, etc., for 1878. Few catalogues, however large, have more complete lists of seeds for fodder and root crops. In the vegetable line also, it will be found to contain everything desirable. Among Mangel-wurzels, we notice Webb's New Kiiver Yellow Globe of which, it is said, eighty-four tons per acre have been grown. Half Long Orange Carrots—Webb's Imperial Swede, Golden Millet, Prickley Comfrey, Cow Peas, Sweet Corn for fodder are especially referred to.

The Jerusalem Artichoke and Chufas, about which we have constant inquiry, are offered. The catalogue is free to all.

Annual Report of the Treasurer of the United States to the Secretary of the Treasury for the year ending June 30, 1877.

E. E. Hardin & Co., Scotia, Schenectady Co., N. Y. New price-list and circular of thoroughbred live stock and eggs for hatching in season.

Report of the Kansas State Board of Agriculture for November and December, 1877. Alfred Gray, Secretary. A very interesting and instructive compilation of facts.

Burke's Texas Almanac for 1878 and Immigrants Hand-book. An almanac for Texas—Farm and Garden Hints—Descriptions of various counties etc. Price 75 cents with map—50 cents without.

Vanderbilt Brothers, 23 Fulton St., N. Y. Seed and Illustrated List, Farm and Garden Implements, Peruvian Guano, Superphosphate, Land Plaster, Plants etc.

Young & Elliot, Annual Catalogue of Vegetable, Agricultural Grass and Flower Seeds, with descriptive and cultural notes. A neat, illustrated Catalogue of 70 pages. Free.

Belcher & Taylor, Chicopee Falls, Mass. Descriptive and Illustrated Catalogue of Agricultural Implements, 54 pages, in great variety.

Samuel Kinsey, Dayton, Ohio. Wholesale Price-list of small fruits.

E. Wyman, Jr., Rockford, Ills. Catalogue of flower and vegetable seeds and summer flowering bulbs for 1878.

Randolph Peters, Wilmington, Delaware, Great Northern and Southern Garden and Nursery. Descriptive Catalogue of fruit and ornamental trees and plants. An excellent book of 55 pages sent free to applicants.

Charles S. Pratt, North Reading, Mass. Descriptive circular and price-list, strawberry plants and small fruits generally.

FOREIGN CATALOGUES RECEIVED.

William Bull, King's Road, Chelsea, London, S. W., England. Catalogue of new and rare plants; 175 pages, finely illustrated.

B. S. Williams, Victoria and Paradise Nurseries, Upper Holloway, London, England. Catalogue of plants; finely illustrated; 80 pages. Also, catalogue of flower, vegetable and agricultural seeds; 65 pages.

Wm. Paul & Son, Waltham Cross, Herts, Eng. Catalogue of roses; 32 pages.

Sutton & Sons, Reading, England. Amateurs' Guide for 1878. 131 pages, beautifully illustrated.

James Veitch & Sons, Coombe Wood, Kingston Hill, Surrey S. W., Eng. Catalogue of garden and flower seeds, horticultural implements, &c. 74 pages; illustrated.

Hurst & Son, 6 Leadenhall St., London, E. C., Eng. Trade seed catalogue. 30 pages; illustrated.

James Carter & Co., High Holborn, London, W. C., Eng. Seed order for 1878; 25 pages. Also, Carter's Vade Mecum—a profusely illustrated catalogue of 100 pages.

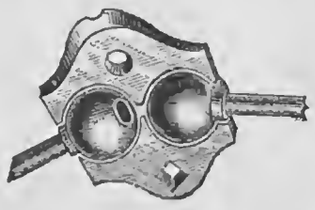
Cranston & Co., King's Acre, near Hereford, Eng. Descriptive catalogue of forest and fruit trees, conifers and ornamental trees and shrubs; 64 pages. Also, a descriptive catalogue of roses; 40 pages. Also, catalogue of flower, vegetable and agricultural seeds; 52 pages.

Daniels Brothers, Norwich, England. The illustrated guide and seed catalogue for amateur gardeners. 116 pages, finely illustrated.

Industrial Implements.

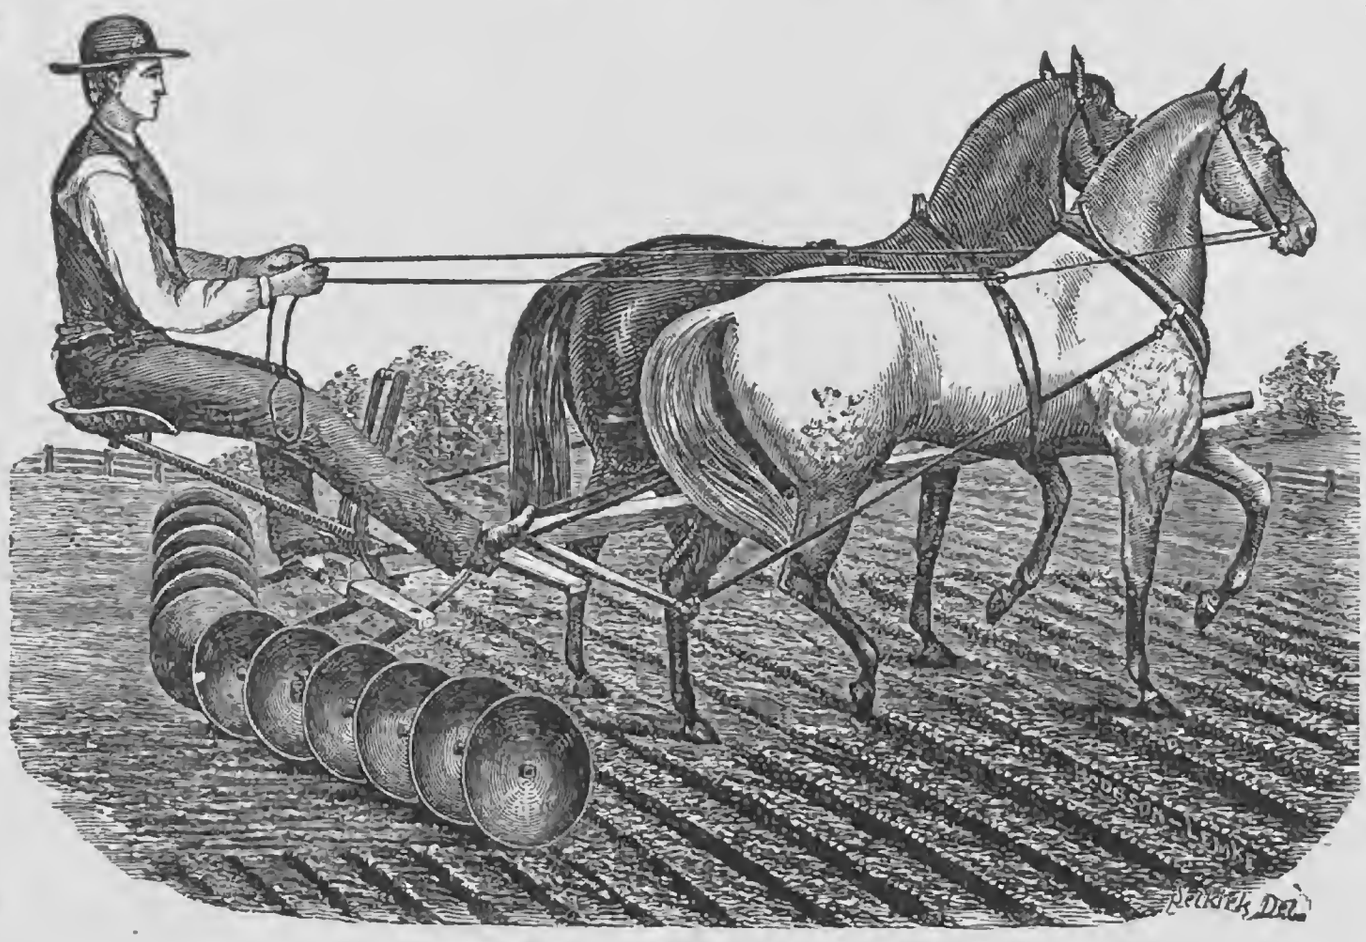
AN IMPROVED HARROW.

The multiplicity of designs for harrows would indicate that if the soil escaped thorough pulverization under the teeth of one it should certainly yield to the scraping disc of another. The best thought and practice of the times agree that harrowing is a branch of agriculture requiring great attention, and on its thorough performance depends a great part of success on the farm. Inventive genius has been steadily directed in this direction, and it will be because of incapacity if the ideal harrow is not introduced.



It would be as senseless as carrying coals to New Castle to parade the necessity of careful working over of the soil to fit it for germination, but we do not believe that the agriculturist gives as much thought to the selection of the most approved methods of accomplishing the best results

We illustrate in this issue an improved harrow (Ladow's patent) made by the Wheeler & Melick Co., Albany N. Y., which lays claim to superior merit. Briefly, the implement is composed of two gangs of adamant metal or steel discs, which work at an angle that can be changed by a lever at the option of the operator. The salient feature is shown in the cut of the universal joint forming a coupling that is strong, yet flexible. The manufacturers say:



AN IMPROVED HARROW.

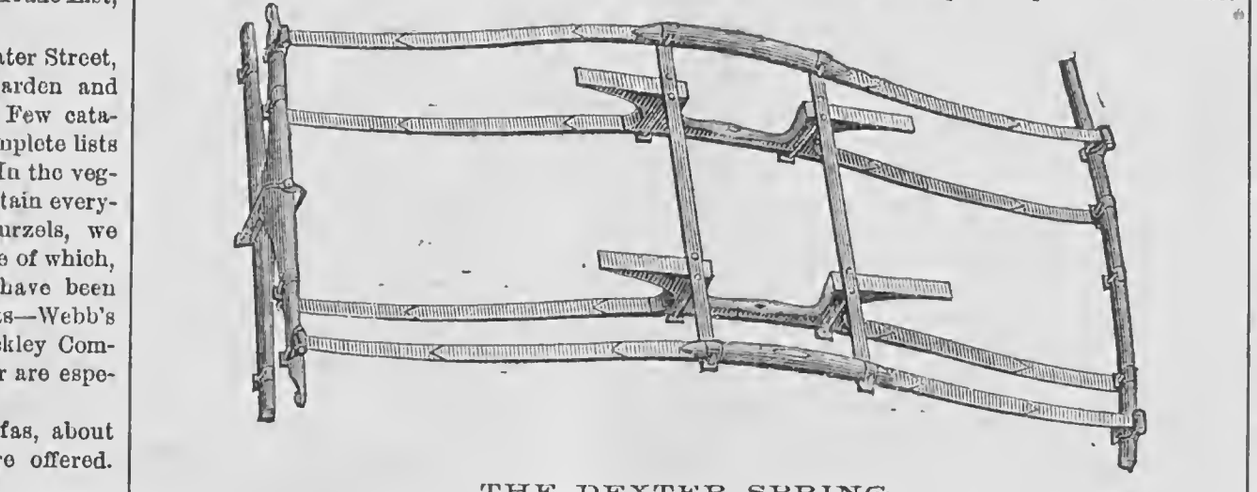
"The wheel gangs being united by a series of universal joint boxes, allows each part to accommodate itself to uneven surfaces, working in a hollow, or dead furrow or over ridges and obstructions, the wheels adjusting themselves to the surface over which they pass, cutting a uniform depth and drawing more easily than if th gangs were rigidly connected. The draft is also lessened by the construction of the center coupling, one gang counteracts the friction caused by the other gang pressing against it, making the harrow draw very easily, even when the driver rides.

The inner wheels of each gang are brought near to a cutting edge with each other, throwing the loosened earth in opposite directions from the center, leaving no ridge in the center. Both gangs of wheels stand at a relative angle to each other, thus overcoming any tendency to work sidewise to the line of draft.

The disc wheels are polished on both sides entering and leaving the earth readily, so that a scraper to clean the wheel is entirely dispensed with and unnecessary.

The journals are protected from dirt, and provided with self-feeding oil cups and the whole Harrow being of iron and steel, except the pole and seat standard, will bear exposure to the weather without injury. The construction is such that any part is easily removed or replaced, which with the system of bracing, renders this a very light, easily handled, and strong wheel harrow.

The price of the harrow with adamant metal discs is twenty-five dollars, steel wheels may be substituted at an additional cost of five dollars. Interested readers will receive a prompt answer to queries by addressing the manufacturers.



THE DEXTER SPRING.

THE DEXTER KING.

The bewildering variety of form that springs have been made to assume is the best evidence of the great ingenuity and study devoted to this important part of a vehicle. Quite the most novel recent improvement is the "Dexter," made by the Dexter Spring Co., Hulton, Pa. The writer personally tested this spring at the Centennial, and was gratified with the result. Its ease of motion and strength were really remarkable. This spring is clearly shown in a previous issue of the Rural; two parallel springs, with a center brace, and malleable fastenings at the ends. The subject of this notice is, as shown in the illustration a modification of this construction, but one spring showing at each side of the buggy; the others doing their work under the body.

By this arrangement a neater and a more graceful appearance is given the vehicle, while The popularity of the spring is the best test of its worth, and the low price at which it is sold puts it within the means of moderate purses. It is easily applied at trifling expense, and many know how to reduce its first cost by disposing of their old replaced springs to the carriage-wright who fits the new ones. The novelty and worth of this article deserve critical examination and the makers will give every facility to our subscribers to learn all there is to be known concerning both the "Dexter" and the "Dexter King."

Various.

GRIMES' GOLDEN PIPPIN.

Will the Rural please give a description of the Grimes' Golden Pippin, and its character in general and oblige one, and perhaps many of its readers. J. G. R. K.

Va.

Ans.—It originated in Brook Co., Va., on the farm of Thomas Grimes in the locality of which it is highly prized for its hardiness and for its uniform annual productiveness. Mr. Downing describes the tree as vigorous, hardy, upright spreading, very productive, branches with peculiar knobs at the base of each, connecting it with the main limbs. Young wood dark dull red brown, grayish. Fruit, medium, roundish, oblate, slightly conical. Skin, uneven. Color, rich golden yellow, sprinkled moderately with small gray and light dots. Stalk rather short and slender. Cavity rather deep, sometimes slightly russeted. Calyx, closed, or partially open. Basin, abrupt uneven. Flesh, yellow, compact, crisp tender, juicy, rich, sprightly, spicy subacid, peculiar aroma. Core rather small. Very good to best. December to March.

The American Pomological Society gives it one star for Nova Scotia, Michigan, Virginia, Ohio, and two stars for Iowa and Nebraska.

EXTRACTS FROM CORRESPONDENTS' LETTERS.

The Codling Moth.

I do not share in Mr. Peck's expectation that the apple is destined to become scarce, although, to prevent it from becoming so, it will be necessary for orchardists to take more care of their trees than they take now, generally; this they will do when they realize the need of it. Certainly apple-worms can pass from one apple to another; the only question would be, do they? I, for one, have no objection to accepting Mr. Peck's statement that they do, because he has seen it; at the same time I think it likely that they remain more often in one apple for their whole larvahood, or only pass from one to another apple which touch. I should expect a larva which was taken from an apple prematurely to enter the first one it could find for food.

I have no doubt that the sooner infected fruit is discovered and destroyed the better; the sap which would otherwise go to a doomed apple, is saved, and the larva is more surely killed. I do not know what "obsolete theories" are referred to, but I hope Mr. Peck does not refer in these terms to the advice to wind bands of hay or cloth around the tree as a trap for this, or its equivalent, is the most generally available means of coping with the pests. I have no belief that the odor of sheep or swine affects the insects; the good that is done is in the timely destruction of *inhabited* fruit and thus of the inhabitant.

Mass. B.

Quick Returns.

I believe that women would be more healthy if they would work more in the garden. Of course, some are not able to do it, and some prefer to hire such work done; but I am speaking to those who, like myself, do their own work, and do a great deal of it. I say the first dish of berries will amply repay for the labor of raising them, no matter how hard it may seem at the time. Amelia.

Notes in the Flower Garden.

Liliums candidum, longiflorum, and lancifolium, are up finely and promise a beautiful harvest of blooms. Narcissus of Double and Polyanthus sorts are in bud and will soon flower. Pansies, Daisies, Violets, and Wall-flowers are in fine array of bloom. Rose bushes—or rather trees—are budding out.

El Dorado, Cal., Jan. 28. W. C. L. D.

New London, Co., Conn.

Some of my annual Dianthus from seeds you sent, were more than three inches across, last September, and covered with the most beautiful pencilings imaginable. My Snap-dragon seeds you also sent, were loaded with flowers of the most beautiful and brightest colors, and nearly double the size of any I ever before raised.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

We enjoyed a very pleasant afternoon at Mrs. Rutherford's last week, the discussion of the "Kitchen Club" being chiefly a paper read by Mrs. Wilson, entitled

"Culture in the Kitchen."

"Culture" said the reader, "may seem a hackneyed word to use in this place, for many people consider this part of a home simply a place to cook, and wash dishes in, or a sort of penal colony for the children when meriting punishment. 'Go into the kitchen,' is a sentence we have often heard addressed to a child, as if the threat was intended to carry terror with it. But I appeal to every housekeeper, especially to those who do their own work, to tell me if they do not often wish the apartment where they spend their time, could be improved and adorned."

"When I get my lounge re-covered, I shall put it in the kitchen" I said the tho other day, and the party to whom I was speaking evidently thought me given to indolence, as the answer came, "What in the world do you want a lounge in the kitchen for?" in the same indescribable tone I sometimes have people say to me, "Pictures in the kitchen!" as if the cheap but pretty chromos were a crime, and the walls of a kitchen must be condemned to remain bare and uninviting.

Some women expend all their surplus energy in stove-polishing, others in scrubbing the floor; and these things are necessary for neatness and comfort. But the hanging shelves where a few books and papers can be placed, the useful clock, the cosy rocking chair, as well as bright pictures, with shining utensils for kitchen use, are signs of culture in the kitchen that are to be admired and copied. A little painting or oiling of our woodwork, a few flowers on a bracket and curtains at the windows are simple things in themselves but they show the taste of the owner more than mere words. Why should the broken chairs and discarded tables be "good enough for the kitchen?" Let us determine that no more of our time and money shall be spent to adorn the closed and darkened parlor until our kitchen is furnished with the best conveniences for our work, and kept fit for any lady in the land to work in.

Mrs. Wilson then went on to name many useful labor-saving helps that have been mentioned before in these "Siftings" and advocated a neat closet with pegs for hats and coats that often are left about by children or hired hands, and are needed too frequently to have a place in the front hall or wardrobe. Plenty of light, and to have it so arranged as to save work, and yet keep up a neat appearance, are the first steps toward culture in the kitchen.

DOMESTIC RECIPES.

Cure for Hoarseness.

The juice and pulp of lemons, stirred thick with white sugar, will relieve hoarseness—besides being an agreeable remedy.

For Croup.

A piece of lard as large as a butternut, rubbed up with sugar, and divided into three equal parts and given at intervals of twenty minutes, will often work well.

For Bronchitis.

A residence in a sugar-house from the first of August until January, has been known to give relief.

For Toothache.

Put a piece of lime as large as a hickory-nut into a quart bottle filled with water, and rinse the mouth with it frequently.

For a Cold.

Drink a tea made by steeping together equal parts of catnip, spearmint, and sassafras. Steep, but do not let the tea boil; put the feet also in hot water. B. C. D.

Moths.

Let me disclose to my Rural sisters a secret well worth knowing: namely, that simply wrapping furs and woolens in common brown paper will prevent the ravages of the clothes-moth. I have been told that professional furriers adopt this simple method with their goods and guard their secret well. E. M. B.

Answer to an Inquiry.

To make paste for a scrap book, nothing equals boiled starch. I have tried mucilage and flour paste but prefer starch to anything else. Prepare as for starching linen and let it cool before using. Farmer's Wife.

Veal Cake.

Chop fine three pounds of veal steak; roll three crackers and beat well three eggs; to these ingredients add a pint can of tomatoes; juice and chopped peel of one lemon; two tablespoonfuls of butter; one teaspoonful each of ground cloves and sage; pepper and salt to taste; mix well together and form into a loaf; place it on a dripping pan; strew bread-crumbs over the top and bake about two hours; keep a cup of water and butter on the back of the range and baste the loaf frequently with it. It is better not to cut the loaf until the day after it is made. Nice for tea.

Apple Jam.

The following is an excellent way to preserve winter apples for spring and summer use. Peel and remove the cores from juicy apples; slice thinly and put into a preserving pan with three-quarters of a pound of white sugar to each pound of the fruit; add a little water to prevent their burning, and a few cloves, a little ginger and the rind of a lemon tied up in a piece of coarse muslin; stir with a wooden spoon over a quick fire for from twenty to twenty-five minutes—careful that the jam does not burn. When cold, put into jars and paste or tie down with thick paper, or it may be put into cans and sealed.

Spinach and Eggs.

Carefully look over and wash the spinach in several waters; boil for about ten minutes in salted water; take up and place on the back of a sieve that it may drain; press any remaining water from the spinach, and put into a frying-pan with two or three tablespoonfuls of butter, a little salt and pepper; keep constantly stirring and cutting with a knife until quite dry. Poach some eggs; lay them on the spinach and serve at once. E. M.

Everywhere.

MORE "FACTS" FROM MISSISSIPPI.

In the year 1867 there originated at Washington, D. C., through the efforts of O. H. Kelly, Wm. Saunders and W. M. Ireland, an organization called the "National Grange," or Patrons of Husbandry. The Order spread over the West, like fire in the woods in time of a drought. At one time the secretary of the National Grange reported an aggregate of one million seven hundred and fifty thousand members in the United States. The always hard-up farming population thought they had found in it a solution of all their difficulties, financial and political, and a means of escape from inadequate representation and the miseries attendant upon mortgages, liens and executions.

And, indeed, were the principles underlying the Order strictly put in practice, all these desirable ends might, in whole or part, be achieved; but people hereabouts join the "Grangers" and then go on in the same old well-beaten path; that is, they go to their old merchants for "advances" on a strained credit, plant more cotton than they can "tend" or gather to any advantage; and elect lawyers, village politicians and demagogues to office. The Grange exhorts its members to "raise provisions, and "grow cotton as an *extra*." It bids its members "to pay as they go," or "do without what they cannot pay for." It urges upon them the importance of co-operating in the purchase of necessary supplies, and so getting their goods at wholesale prices. But this co-operating business is what "no fellah" can induce a hard-headed old farmer to do. He has an idea that he can make his individual ten dollars go farther by his own shrewd manner of "trading" than by lumping it with the ninety dollars of his brother Grangers, and you can no more drive the notion out of of his head than if it had been hatched in the cranium of "hard-koppig Pete" of New Amsterdam. Not only so, but after "resolving" in the Grange that he will "stand by men of his own vocation," he will go to the next convention and vote for office for some plausible wireworker who never handled a plow or a hoe in his life. This he will do after a "big talk" regarding the Agricultural Endowment Fund of Mississippi, amounting to forty thousand dollars still lying idle, or the interest on it applied to alien uses. It tickled the Grangers greatly that the "Department of Agriculture at the Mississippi University at Oxford, consisted of fifteen acres of worn-out land, "tended" by an old "darkey" and a "blind horse." The Grange requires from its officers "reports on crops, system of culture and amount produced;" but such "reports" are eliminated to a greater degree in the after dinner meetings, through social chats, than in formal written presentments.

There is a class of farmers in this country, who are slowly accumulating property. These are the men who were called "poor" in slavery times, because they owned no slaves, or very few, and worked themselves. Such men knew how to "take hold" when self-support was thrust upon them by the results of the war. They not only knew how to work themselves, but their wives and children had definite ideas on the subject, and now these "practical Grangers" are the men who have the biggest "hog killings," who raise corn as well as meat to "do them," also wheat, rye, oats, sorghum and rice. They are the men who put up flour mills, who understand the process of making syrup from sorghum, as the "Chinese sugar-cane" is called, and grind their neighbors' cane, and turn many an honest penny at a pinch, by carrying around portable threshing machines and cotton gins. These practical Grangers have large flocks of sheep, and their little daughters knit the wool into socks and stockings enough to supply the family. They are even "long-headed" enough to invest their hard-earned gains in improved breeds of cattle, and some of them have a few "short-horns" of the Durham breed among their cows, and even a pair of Merinos among their sheep.

Perle Perbu.

NOTES FROM CALIFORNIA.

February will soon be growing weak; time is fleeting fast; the sun, in all his glory, beams down on the greenest of carpets; rain has come in plenty; the ground is literally soaked, being wetter than it has been for several years. Glad tidings come from all sections of the State.

Almonds are in full bloom; cherries and other trees are swelling, and will soon be covered with masses of snowy bloom. Pruning and grafting are now in order, and must be pushed vigorously forward. Strawberries in many sections, are in full bloom; half-ripe fruit is frequent in some lots.

In the vegetable garden, there is work in abundance; a few of the best kinds for California are—of Tomatoes, Hathaway and Canada Victor; of Beans, Ferry's Golden Wax and Royal Kidney; of Lettuce, Hanson and Silesian succeed well; of Radishes, I like the French Breakfast the best; always tender, tubers well and never with the strong, rank taste so frequent in other sorts. Blood Turnip and Pine-apple Beet are both good, and are the best varieties I have ever grown. Tailby's Hybrid Cucumber is the finest in cultivation; it is tender; even in large specimens it is free from bitterness, and being a pretty fruit, it should be very popular.

El Dorado, Cal. W. C. L. Drew.

[We are rejoiced at last to find somebody that indorses what we have said of Tailby's Hybrid.

Feb. 27. Millions of dollars of damage have since been done by floods.—Eds.]

NOTES FROM NORTH CAROLINA.

For the last two months we have had all sorts of weather. Early in January we had a freeze-up for a few days; since then the roads have been in a very bad condition, notwithstanding the annual repairs, which consist in putting pine brush in the worst mud-holes when they become impassable. Our supervisor, when remonstrated with, replied that "we must do something, and as the roads were good during summer, we could only repair them in winter."

No snow until yesterday; just enough then to whiten the roofs. Stock of all kinds are wintering well. Plowing commenced, and next week a good deal of oats will be sown. Horses and mules from the West are in plenty; prices low and sales slow. Farm products are in good demand and at fair prices for these dull times. Corn, 55@65c.; oats, 50c.; corn-fodder, $1 per hundred; Northern hay $30; North Carolina hay, $20 per ton; sweet potatoes, 50c. bush.; Irish, $1.25; tobacco ranges all the way from 30c. per hundred for inferior lugs to $65 for bright fluecured wrappers. Peaches are safe, as yet. Although this has been a mild winter, the temperature has been even, and we have had no such warm days in succession as to swell the buds. Two years ago, at this date, many trees were in full bloom. M. B. Prince.

Brookston, N. C., Feb. 19, 1878.

WHAT KANSAS NEEDS.

I do not know how many readers the Rural has in the great Mississippi basin, but it must have *many that are looking* to some part of this vast region for homes, in the future. There are a thousand conditions that are peculiar to the West, so that recommendations that may be profitably followed by Eastern men, would often utterly fail among us. For example, one of our great interests is tree culture, but our people have followed the rules laid down by Europeans and Eastern men who knew nothing of our climate until hundreds of thousands of treasure and years of precious time have been wasted. Eastern men have given us, again, a "timber act" that is more useless than a fifth wheel to a carriage. But an "act" embracing even a few elements of possible success would have conferred a great blessing upon the whole country. What we want now is more light for the people upon the subjects of tree-planting and fruit culture, where our conditions and practice are essentially different from yours in the East. How to get this before the people is now the question E. G.

Riley Co., Kan.

RURAL SPECIAL REPORTS.

Humboldt, Tenn., Feb. 22, '78.

It is now about twelve hours since the rains commenced, and the down-pour still continues. For the past week the weather has been warm, and we have had but little frost. We had a cold snap, however, on the 4th of January; during which, for a few hours, the mercury dropped away down to zero. During the past year, we have certainly had double the amount of rainfall usual, desired or beneficial, nor is there to-day any prospect of its ceasing. Bottomless mud and bottomless slush are everywhere. If the roads were as "hard" as the times, we could get along splendidly. But it is much to be wished that the roads were harder or the times not so hard. Provisions are plentiful and cheap enough. Hereabouts, we would prefer a little more "Greenbacks." With these we know we would feel better, and think we could do better. We don't like a hard money basis. It doesn't suit poor folks. B. F. T.

Poquonoc Bridge, Conn.

"Old Probability" has been busy enough around here celebrating the birth-day of the Father of our Country by one of the hardest storms felt for many a long month. The rain has been falling in torrents for twenty-four hours, and there are yet no signs of its clearing up; the tide is far above ordinary high-water mark; the wind whistles and howls across the channel and around the house corners with a terrible noise. Our winter has passed without any snow to speak of—something new to the oldest inhabitant. Business is dull, money scarce, tramps plentiful, provisions cheap. Pork, 5c. per pound; coal, $4 ton; eggs, 18c. dozen.

Feb. 22. M. W.

Cherrytree, Pa., Feb. 25.

This has been a remarkable, pleasant winter; so far, we have had very little cold weather. On January 31st it snowed all day, and then during the first week of February we had tip-top sleighing and weather as pleasant as could be wished for. Market prices are low for all kinds of produce except apples; they are worth two dollars per bushel, feed is plenty and stock is doing well. D. A. K.

The Vineyard.

CHAMPION GRAPE AGAIN.

Your correspondet, E. F. Ellwanger, in Rural of Feb. 9, gives the correct version of the origin of this Grape with two trifling exceptions. It originated in the garden of a Mrs. not a Mr. Tolman—not Tallman—as he writes it. I wish Mr E. had stated that this Grape was sold by Mr. Day, to Mr. Spaulding, under the name of "Tolman," for such is the fact. If Mr. Spaulding would "rise and explain" the reason why he sold it under the new name of "Champion," instead of its original one, by which it was well-known and I may add, generally condemned in this vicinity, it might be of interest to many now in ignorance as to his motives.

Let us hope his object was not to deceive, by flashy advertisements of his so-called new grape some of us into buying, at exhorbitant rates, what we already had too much of. It was by the merest accident that I was saved from paying $3 for two of these "Champions," after I had fruited the Tolman for five years, by which time I had become thoroughly disgusted with it. Mr. Ellwanger thinks that the Champion is from "ten to fifteen days earlier than the Hartford, and is as good as, and more productive than the Concord.

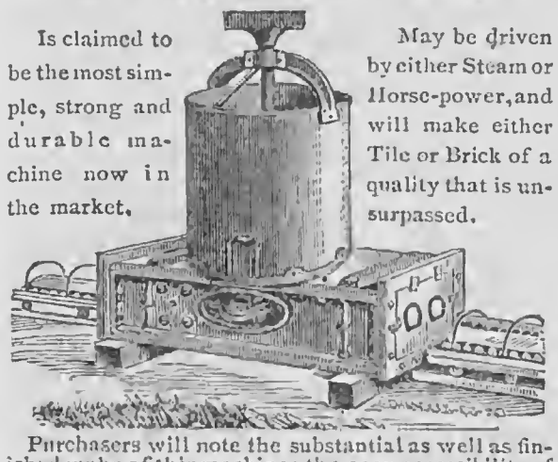
With me it is not fifteen *minutes* earlier than the Hartford, and (to my taste, remember,) it is the poorest grape in quality that I have ever chanced to meet. A Grape "that is ten to fifteen days earlier than the Hartford, and as good as, and more productive than the Concord," ought, in ten years, to have overrun the entire country—this State at least—like a "wild-fire." This is just such a Grape as we are all anxiously searching for. I would willingly pay $100 for one dozen plants of such a desirable variety. The fact is, that in this vicinity, where the Tolman originated, where it has been longest cultivated and where it is the best known, it is generally condemned. There are not one-half as many bearing vines here as there were five years ago. I will venture the prediction that both the Hartford and the Concord will be grown when the Tolman (Champion) has sunk into oblivion.

It may interest Rural readers to learn that this Grape has already assumed a *third* name, under which it is to be discreetly disguised, properly puffed and offered to a credulous public. My advice is, to beware of all "early grapes," offered by unknown or irresponsible parties: otherwise some of us will surely get humbugged. We should also refuse to deal with any man who knowingly will, in any way, countenance this renaming and selling old, discarded or worthless varieties of fruits, plants, seeds etc. We should also expose all dealings of this kind, as we have the opportunity. I wish Eugene Glen, or some one else, posted in the intricacies of the law, would inform us whether or not such practices are not in violation of law as well as of sound morality.

Syracuse, N. Y. Nelson Ritter.

Implements and Machinery.

The Phœnix Drain Tile Machine



Is claimed to be the most simple, strong and durable machine now in the market.

May be driven by either Steam or Horse-power, and will make either Tile or Brick of a quality that is unsurpassed.

Purchasers will note the substantial as well as finished make of this machine; the easy accessibility of its working parts; the means of keeping its plunge-chamber to fit closely, without reference to age or wear; and its general suitability for making Tile at the lowest cost. SEND FOR CIRCULARS.

N. B.—Also manufacturers of the celebraced REMINGTON PATENT STEEL SHOVELS, SCOOPS, SPADES, Etc. Also, Right and Left-Hand Steel and Grey Iron Plows.

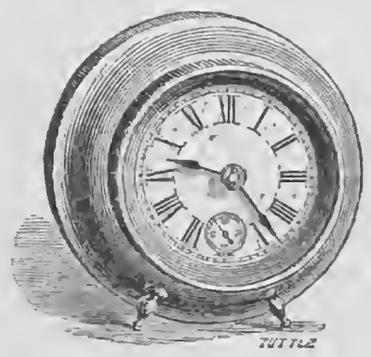
WHAT THEY SAY OF IT.

SECOND ACKNOWLEDGMENTS.

ALL THINK IT "SPLENDID."

DEAR SIR:—I send you money order for $5 and two new names, one of them being my own. This makes my second remittance. The first clock was received in good order, and showing it in our store, I was compelled to sell it to a friend who would not take nay for an answer. So I lost my "Cricket" before I had owned it an hour. I then went at it again, and have secured the additional name (with my own) I send you, although it was mighty hard work to get him to subscribe. Every one to whom I showed the RURAL likes it; but the mud has about put a stop to all business out here, and there is no money in the country. I think the "Cricket" is a beauty, and if it keeps as good time as it is handsome, it is without doubt the "boss" premium. How can you afford to offer it! Wishing you success, I am, your friend,

Milton, Kan. S. H.



"WHAT a little Beauty!" was the exclamation of all the children as they crowded around me while untying the package that contained the RURAL "Cricket." The enthusiastic expression of admiration the first sight of it drew from the juvenile members of the family, was modified a little later by my husband, who on his return home, doubtfully remarked, "Well, I hope it will be as correct as a time-piece as it is handsome as an ornament—but I don't see how they can afford to give, for so small a consideration, a present combining both beauty and utility." This was a week ago, and I resolved to defer acknowledging the receipt of the premium, until its merits as a time-keeper should be tested. In the interval it has been quite as accurate as our family clock or my husband's watch, which, according to him, is infallible. S.

Seneca Co., N. Y., Feb. 27.

WELL, through the dear old RURAL, I've got at last what I've long been—shall I say pining, hankering or anxious for?—a pretty little time-piece of my own, making my room much more cheerful and—shall I say habitable? Some time back my brother Ned got a new watch and at first we had lots of fun at his habit of pulling it out every few minutes to see what time it was, but I can tell now just how he felt, for I've been up stairs for the last two days, scores of times just to see how the "Cricket" was getting along. Several other girls also have been in to see it, and if the RURAL doesn't get many more subscribers from this neighborhood, it won't be for want of school-girls anxious to have a handsome little "Cricket" MINNIE L.

Newark, Ohio, Feb. 26th.

YOUR card received yesterday and the "Cricket" to-day, and we are highly pleased with its appearance. Yet there are many pretty things in this part of the world which are not known to possess any other commendable quality; but we hope this may not prove such. We have placed him upon the shelf, and he has started off on his round of duty with a pleasant face and bold front and a clear and distinct voice, and if he shall prove himself worthy of trust, we shall admire and esteem him highly. D. C.

Onondaga Valley, Feb. 28, 1878.

I SEND you $3.50 for another Cricket. The first which you gave me for two new subscribers, I sold for $3, so you see I now get a Cricket *and* the RURAL for myself for 50 cents. I shall try for more. E. T. B.

Glen Cove, N. Y.

THE "Cricket" is received and I was agreeably surprised, not expecting to find as neat a little arrangement for a time-piece as it is. How you can give as nice a *present* and the RURAL for the money ($3.50), rather puzzles me, as I don't see where the profit comes in. We always used to suppose the RURAL worth all the subscription, but to have a reminder of it every hour, minute and second before us, is not at all unpleasant. Surely we cannot forget when the time comes to renew our subscription. Fifty-two such papers and a clock for $3.50! It is cheaper than any reading I am acquainted with, taking into consideration the quality.

Palnesville, Ohio, Feb. 24. J. W.

I HAVE received the "Cricket" Clock, and we are entirely satisfied with it. A. E.

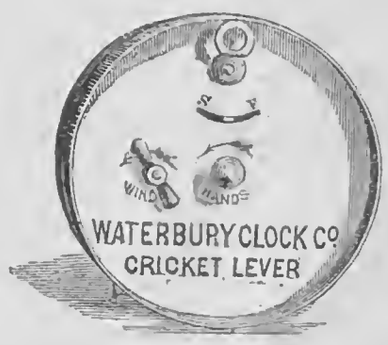
Providence, R. I.

THE Cricket is received and is a perfect little gem of a timer, and has the appearance of being durable. It is worthy of patronage with the RURAL by every family in the land. Wishing you much success. J. G. C.

Bridgeport, Feb. 25.

MR. EDITOR:—I sent you $10.00 and the names of four subscribers. I know that they were new, because they had never seen the paper before I showed it to them. I am more than pleased with my clocks, and think I shall send you some more subscribers. I got two clocks which were one more than I wanted. I sold one for $2.50, so I am more than satisfied with my work. This is my first trial at canvassing, and I was surprised to find it such easy work. You will hear from me again. S. N. F.

Troy, N. Y. Feb. 15, 1878.



I RECEIVED my clock all right and we are greatly pleased with it. Inclosed I send you Money Order for $3.50 for one more subscription and another "Cricket." A friend called in just as we received ours and we persuaded her to subscribe, and to add one dollar for the clock which is certainly worth five. Long life to the RURAL! L. J.

Glen Cove, L. I.

I HAVE carried mine about in a traveling bag from place to place; it keeps excellent time, is as "handy as a pocket in a shirt." They look to be worth more than twice what you ask for them. A. R. C.

New York City.

THE "Cricket" received, and O! what a beauty. How the RURAL Publishing Company can furnish two yearly subscriptions to such an excellent paper, and such a beautiful little clock for the small sum of $5, passes my comprehension. I am afraid you will not be able to supply the demand for the "Cricket" when your liberality is more generally known. The clock itself is worth the money, and the paper is worth twice the subscription price. Success to the RURAL and the "Cricket." Yours,

LONG ISLAND.

DEAR RURAL:—By to-day's express, the premium for new subscriber to RURAL in the form of a *beautiful* little clock arrived; it is in every way a little gem; it pleases the wife, the children, and all the household. It doubly repays for the labor in obtaining the two names. I cheerfully commend it to the friends of the RURAL as a choice and ornamental time-piece, and worth working for. W. H. R.

I RECEIVED the "Cricket" clock yesterday. It was all right. I sold it for $2.75 within an hour after receiving it, and before I got home from town. I am going to have another. Clocks will be plenty now. N. BURNHAM.

Amboy, Ill., Feb. 26, 1878.

P. S.—The Express Agent charged 30 cents. He said that to get reduced rates, expressage must be paid in advance.

[ANS.—Fifteen cents sent to us with order will prepay expressage.—EDS.]

IT is the most complete little thing we have ever seen in the shape of a clock. E. S.

Grand Rapids, Mich.

IT has kept exact time so far, and is a neat ornament for the mantel. I shall try to get one more. E. N. K.

Meadville, Pa.

I WOULD not take ten dollars for mine, if I could not get another. It has not varied a minute since yesterday. You may publish this.

Yours sincerely, C.

Dayton, Ohio.

MY premium came in good order. It arrived in time for a birthday gift to Mrs. L. You will accept my thanks. I can look with great pleasure over the many things which I have received as premiums from the Old RURAL: it would take some time to name them all.

Coxsackl, Green Co., N. Y., Feb. 25. J. H. L.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
178 Duane Street, New York City.

SATURDAY, MARCH 9, 1878.

THE offer to sell the engravings used in this journal at ten cents per square inch has brought us many requests to send to parties proofs from which to select. Now, we have over 10,000 cuts, so that it is quite impossible to comply with such requests. Besides, the price is so low that we could not afford to do so even were it practicable. Those desiring to purchase these cuts—for which we have no further use—will be obliged to select from files of the RURAL most readily accessible to them.

WE have to thank our friends for their responses to our request respecting "Hide-bound Trees." Having yet a number of excellent communications upon the subject, which, however, for the most part, are repetitions of what has already been said, perhaps it may be well to consider the subject sufficiently discussed for the present.

NEVER since we have known the RURAL have we been constrained to delay the publication of so many valuable articles. We do not say this to discourage our friends from sending future communications, but for the purpose of enlisting their patience for a few weeks.

HOW TO REMEDY ONE EVIL BY THE EMPLOYMENT OF ANOTHER.

TRAMPS and bad roads are both grievous evils in almost every district throughout the country. It is a merciful decree of fate, that when one is most harassing the other is least troublesome; for were the rural population afflicted with the worst phase of both at the same time, flesh and blood could hardly bear the twofold visitation. It is, probably, this alternate culmination of the annoyances that has prevented the idea of using one of the evils to mitigate the other. Tramps profess to be in eager search of a market for their labor, while the roads they infest are in urgent need of it; but though supply and demand, both equally importunate, are thus brought into the closest proximity, the public has hitherto been blind to the obvious method of practicing the first principles of trade, redressing two crying evils, and vastly benefiting society by employing these gad-abouts to repair the highways. In such a measure, poetic as well as prosaic justice would be admirably exemplified, for of all the incumbrances that obstruct our thoroughfares, there are few that render them more disagreeable or dangerous than these alternately cringing and truculent vagabonds. Now that the mild weather of a probably early spring is about to start these nomads from the lock-ups, charitable institutions, rookeries, and squalid purlieus of cities and villages, on their annual holiday peregrinations throughout the country, not a moment should be lost by the rural population before organizing a system by which they should be made to earn their bread; and as they have hitherto won it metaphorically "on the road," it will be meet for them henceforth to do so literally.

CLOSE OF THE EUROPEAN WAR.

THE signatures of Russia and Turkey to the treaty of peace have doubtless put a definite end to all reasonable fears either of a renewal of the terrible European struggle that has lately been suspended, or of any immediate outbreak of hostilities between other transatlantic nations. The humiliating and disadvantagous predicament in which the final settlement leaves Great Britain, will probably prompt that arrogant little island to bluster and fume a trifle longer with great self-satisfaction but little harm to others. Certain it is, however, that the hostile step she shrank from taking when sure of the grateful aid of Turkey and hopeful of Austria's powerful assistance, she will hardly venture upon now that the former has been utterly prostrated through misplaced confidence on her support and the latter has been conciliated by her enemy.

While the Ottoman Empire has been utterly ruined by the results of the conflict, and England virtually excluded from intermeddling in future in continental questions, the glory of the Muscovite has not been of a very dazzling order in view of the comparatively feeble and diminutive proportions of his swarthy antagonist and the powerful blows this pigmy at one time managed to plant on his gigantic body. The material advantages reaped by the Northern Colossus, however, are of vast present and still greater prospective importance. After crushing his hereditary foe he has converted him into a dependent and useful ally. In Servia and Roumania he has established two nominally independent States, which are really vassals to him; in Bulgaria he has set up a new principality in Turkey, that will soon be sure to follow the example of successful revolt set it by its two neighbors: he has gained a foothold on the Danube by the appropriation of Bessarabia; and, finally to crown his European triumphs, he has torn to shreds the treaty of Paris—that memento of his defeat in the Crimea. Still greater both in *prestige* and profit are the Russian acquisitions in Asia. By means of these Muscovite renown will be spread all over the East, from the Mediterranean to the Yellow Sea, while the territory appropriated assures the final subjugation of the Caucasus and opens the gates wide to the Czar's conquering legions into Persia, Central and Southern Asia, and peradventure, ere long, into British India.

THE REMEDY FOR UNJUST WEIGHTS AND MEASURES.

IN many places—especially in the newer portions of our country—there is great talk among the farmers of false weights and measures. We could give a very large number of definite examples of this kind, which have come within our observation.

Hogs fall short from five to twenty-five pounds each. Buyers take from fifteen to ninety pounds of wheat or oats from each load bought in the street. At the close of the season, one buyer in a small town had a surplus of two carloads of wheat left over. This was equally divided between the dealer and the Railroad Company. Two bags of clover seed fell short sixteen pounds; a small crock of butter three and a half pounds; three bags of barley ground at a mill fell short fifty pounds, besides the lawful toll; a load of wool shrunk fifteen pounds in going to town. Meat, tea, coffee, sugar, and all kinds of groceries, often fall short from five to twenty-five per cent. Two firms advertised kerosene at five cents a gallon less than most other dealers. They were found to make up the difference in price by the shortage in measure. At one railway depot, in two years, fifteen thousand bushels of grain were taken out of the farmers.

Most of the above examples were detected by the good sense of several farmers. They mistrusted they were being cheated. They bought large and small scales, and carefully weighed everything before going to mill or to market. The cheating is done by leaded weights; two sets of weights, two sets of trucks, and various other devices which ever suggest themselves to minds wanting to use them.

We have mentioned only a few cases in which we could give the names of the parties. What shall the farmers do about it? They might go to law, but they are a peaceful class of people, and dislike to make a "fuss." The enterprising men referred to are now buying and selling by their own weights and measures. They are saving each year more than the cost of the scales and the trouble of weighing. Grists of grain they now weigh in, and weigh out of the mills. Such farmers are looking out for their rights; many others are catching the same spirit. Heretofore they have done as do now a very large majority of the farmers in the country—they allow the buyer to set his own price, do his own weighing on his own scales, and make his own figures as to the result. Such farmers court abuse from all dealers who are in any ways inclined to be dishonest. Who says that the farmer does not need to keep his ears and eyes open, to learn the tricks of the trade? Successful men are learning to conduct their farms on business principles.

PROFITABLE WORK AT HOME.

WHERE there is a will there is a way. The old adage is nowhere more true than in finding work. The man who relies wholly on employment which others can give him, makes a serious mistake. It may be, as in thousands of instances it unfortunately is the fact, that such a one will for long intervals be thrown out of work. When the capitalist ceases to make a profit, he dismisses hired help and closes out his business. This is what has happened to many thousands of the unemployed to-day. It will always be so while men rely on others for the privilege of labor. Some means by which the mass of men may at least partially employ themselves is the only practical remedy. Whoever has a *home*, be it never so humble, has received the first means to an honorable independence. There is always something to be done to promote the convenience and comfort of the home, and, in the absence of work giving money remuneration, making the home more pleasant and comfortable is the best paying job which any man can undertake. It is a sign of shiftlessness, if not worse, to see men idle while a day's work might be well expended in battening doors and windows against winter's rude blasts, or in providing some simple conveniences long needed by the good housewife to lighten her work.

NOTES.

Weeds along the Roadsides.—The Assembly the other day, at Albany, discussed for some time a bill which was on the calendar, requiring noxious weeds to be cut along the highways. The debate took a wide range, and was participated in by a number of members, some of whom contended that once a year was often enough to have the weeds mowed down; and others thought that the more harmful sorts, like thistles, should be cut twice in a year. There was a dispute also, whether elders and alders are weeds, and whether weeds should be cut anywhere except along-side of improved lands. At last, after the botanical knowledge of the legislators had been severely tested and their wisdom well ventilated, some one said he believed there was a law now on the statute book which provided for the destruction of weeds, and he felt sure it covered the ground better than the bill they had been talking about; so the bill was "progressed," as they say in legislative phrase, and went over to another day. The revised statutes of New York do make it the duty of the overseer of highways to cause all noxious weeds to be cut twice a year—once in July and once in September—and the time so spent shall come out of the highway tax. The law was not well enforced; but since the statutes make it unlawful for stock to run on the highway, the owners of land are quite generally mowing the roadsides, and in this way the weeds are destroyed; any inhabitant can complain and compel the overseer to comply with the demands of the law, or he is liable to be fined: so that every owner of land can now protect himself from the foul seeds which might mature on the roadside and be scattered by the winds on his farm.

Caution to Poultry Shippers.—Dressed poultry often gets caught in a thaw and arrives in New York in bad order. On January 26 there was a large amount of this sort of meat which had no doubt started for market during the cold snap at the beginning or middle of the week, and arrived here in the midst of fog and mist to rapidly sour and spoil. Such meat is usually bought by irresponsible hucksters who peddle it through the streets to poor people. Some of this poultry unfit for food was offered at eight to ten cents per pound on Saturday and at night in some streets, a pair of chickens were offered at six cents for the pair, good poultry being worth from fourteen to sixteen cents per pound. The vendors ought to be arrested. They buy this stuff by the load at a nominal price of the commission merchants who dare not put it on the market. It is hard for the shippers as they must lose its entire worth, and in such open and uncertain weather as we have had this winter, their losses have been too frequent to be at all comfortable.

Teamsters' Mistakes.—Draymen seem to forget, or else they do not know, that the draft of a wagon is doubled when the wheels turn on snow, and very much greater still when the snow is deep and mealy. We could never see the advantage of overloading a team and spending so much time in getting them started when they get set, as they are sure to do, if the load is too heavy. Better take a less load and go quicker without any risk of injuring the horses. In the cities, as well as in the country, there are more or less treacherous holes which it is well to think about when an unreasonable weight is put upon a vehicle. And it is wise to remember that one team stalled on a thoroughfare will often hinder a score besides themselves.

An Easy Way to Secure the Rural and the "Cricket."—We are very pleased to know that every one who has written to us upon the subject has expressed himself more than pleased with our Clock, and that we have not exaggerated its merits in any way. One subscriber sent us two names and received the Cricket Clock. He readily sold it for $3, by adding fifty cents to which he was enabled to secure the RURAL for one year *and* the Cricket Clock. The second installment of "What they say of it" will be found upon page 155.

BREVITIES.

LET's get up a great political party to abolish politicians.

KEEP your poultry-houses *dry*. It is more important now than at any other season.

MR. B. K. BLISS has *done much* in the matter of introducing new varieties of potatoes. But Mr. J. J. H. GREGORY has DUNMORE.

WHAT THE CLOCK SAYS.

"TICK," the "Cricket" says, "tick, tick, tick:
What you have to do, do quick;
Time is gliding fast away;
Let us act, and act to-day.

"When your mother speaks, obey;
Do not loiter, do not stay;
Wait not for another tick,
What you have to do, do quick." [*Parody.*

WE find the following funny advice as to hotbeds in the agricultural department of a contemporary: "After the first intense heat passes off, throw on very fine soil, made of *well-rotted manure free* from *straw* (adding a little sand if the soil is *inclined to be hard* and some *superphosphate of bone* if you have it." The italics are ours.

THE following from Mr. VICK'S Monthly Magazine for February, is a forcible expression of what we have often tried to convey to our readers: In Europe, farming is held in the highest esteem—it secures the attention of men of the higest political and social positions. Even Royalty is not dishonored by contact with soil. For such persons to engage in commerce or "shop-keeping" as it is called, would be a disgrace. Here, farming is degraded below the shop. *Only a farmer* are words we often hear, not used as complementary terms. The farm is not a place for stolid drudgery and unthinking toil, but a field for study, thought and research—a place where not only money but honorable name may be earned. When this is true of American farms and farmers, our young men will follow the occupation of their fathers and flowers will adorn every country home.

BUSINESS NOTICES.

SEE Mr. MINER'S adv't of White Grapes and other fruits—something new and valuable.

Literary Miscellany.

PROVEN.

I.

My love spurred over the mountain side,
And "O for an adamant wall!" he cried,
"Whose summit that uppermost star should hide;
Straight over its terrible hight I'd ride,
For my heart is gladsome and young and strong,
And never a barrier could stay me long
With this love my soul o'erflowing."

II.

My love rode down to the broad sea side,
All down to the kiss of the onward tide,—
A kiss like the kiss of a toying bride;
And, "O for a mystical sea!" he cried,
"Where the waves should clamor like beasts of prey;
For I by this love could their fierceness stay
With never a tremor showing."

III

My love he came to my waiting side,
And his broad arms offered a haven wide,
So I launched my life on its beating tide,
Fearing no evil with him for a guide;
A little star touching the disk of the sun,
And the moon looked down on the hearts made one
With passionate love o'erflowing.

* * * * * * * *

IV

My love was brought to a mountain side,
Where the way was weary and rough and wide;
And "O 't is a perilous road!" he cried;
"Push on! for a woman may safely ride;
And I at the foot till you come again
Will wait in the levelling autumn rain,
Or harvest the springtime's sowing."

V.

My love was brought to a broad sea side
Where the waves grew higher at every tide;
And "Sail as 't were Heaven you sought!" he cried,
"For God shall a woman most safely guide;
And I will pray as never before,—
Will wait and pray on the desolate shore,
Where the cold fierce winds are blowing."

VI

My love was laid at my weary side;
And 't was "O for a surer hope!" he cried;
And my poor weak love on my bosom died.
Alone I had passed up Grief's mountain side,
Alone had ferried Sin's foaming tide;
And over it all God made me brave,
Yet under it all my heart would crave
A love who should share the going.

Boston Transcript.

THE MARKED HAND.

"Is this the last stoppage, guard?"

"The very last, Miss. We shall have a long run of two hours now before we reach Chenworth—no more disturbances of any kind; so just take my advice—make yourself comfortable, and have a good nap. I wish you pleasant dreams;" and the old guard nodded good-naturedly, as he locked me in.

I was glad to be alone at last. It had been very pleasant during the early part of the journey to observe the faces and manners of my fellow-passengers; but now they had all got out, and I felt quite prepared to take the guard's good advice.

It was a comfortable first-class carriage, with the usual two divisions on each side, and lighted up on this dark December afternoon by a dimly-flickering oil-lamp. I took off my hat, stretched my feet across to the opposite side, and, closing my eyes, began to think a little. First of all my thoughts took a retrospective view—back to the little parsonage on the green hillside, to the patient, hard-working father with the incessant cough, which ended at last in a quiet grave under the yew-tree, to the gentle widow-mother who followed him after a few months of hard struggling with poverty and sickness—next to stirring memories of happy school-days, and then to the monotonous life with two old aunts on the wild Yorkshire moors, and finally to Reggie's appearance on the scene, which changed the whole course of my existence.

I was on my way to spend Christmas with Reginald's family. It was my first visit to them, and I felt nervous about it for two reasons—first, because I had been so unaccustomed to visiting, and, secondly, because it is always trying for a girl to go amongst her new relatives for the first time. However, from all Reggie had told me, about mine, and from their kind letters to me, I felt convinced that there was really not much to fear.

At about this time in my reflections the borderland between waking and sleeping melted away and I found myself in a dream. The place was a church, the subject a wedding, the parties concerned were Reginald and myself. I had a hazy idea of light dresses and bright faces, and there was a feeling of great happiness in my heart; but nothing was very distinct till I heard the words, "Those whom God hath joined together let no man put asunder," and then—then I knew that something had come between Reggie and me. It was a hand, a woman's hand, peculiarly white, long and thin, with a bright red mark reaching from the wrist to the knuckle of the middle finger. I remember in my excitement striving in vain to push it away and to reach Reggie on the other side. I remember glancing down at my bridal dress and seeing it changed to one of deep mourning; and then with a sharp cry of pain I awoke.

I awoke—but I did not experience that feeling of relief which generally follows on waking from an unpleasant dream. Something was still weighing on me. I sat up and looked about. I know from the inky blackness outside and from the peculiar sound of the train that it was now passing through a tunnel. The flickering light of the lamp fell on the seat in the opposite corner of the carriage. In that seat sat a figure—the figure of a woman dressed in dark clothes and very much muffled up. She wore a thick black veil over her face, and she sat bolt-upright, as still as if she had been a statue or a ghost. I looked farther, and perceived a small traveling-bag by her side; that relieved me. Ghosts do not usually travel with luggage. She must be a human being after all. But how had she got in? How had she crossed over me without waking me? Why did she sit in that peculiar position? All these questions puzzled me, but I saw no way of solving them just yet. I was afraid to speak, so I could only sit still and wait, my eyes fixed with a sort of fascination on the strange figure opposite to me.

I glanced at my watch; it wanted half an hour to the time when we should reach Chenworth. She must show her ticket there, and I should at least see her move. The time seemed very long till the train began to slacken its speed, and I knew we were drawing up to the ticket-platform. I got mine out that I might have leisure to observe my fellow-traveler. Our carriage was near the end of the train, and I was growing more impatient every minute. In time however the man appeared at our door, holding the small lantern usual on such occasions. I handed my ticket at once; my companion was some time in producing hers, and, when she did so, a corner of her cloak fell back and displayed her left hand. It was ungloved, peculiarly white, long and thin, with a deep red mark reaching from the wrist to the knuckle of the middle finger—in short, the hand of my dream!

I cannot describe what I felt then; a cold chill seemed to run through me, and a feeling of faintness crept over me, so that I was thankful indeed when the train reached the station. My fellow-traveler got out, and I heard the welcome sound of Reggie's voice.

"Why, Nell, how cold you are! You're frozen to death, child; yet you seem pretty well wrapped up. Had you a foot-warmer?"

"Yes—I felt chilly only just now. But stay, Reggie. While you are looking after my luggage I want to speak a word to the guard. There are two trunks and a small tin bonnet-box; you will find them marked in full. I shall be back in a minute." I pushed through the crowd to where I saw the guard standing, and touched him on the shoulder. "Guard."

He turned round sharply.

"Did the train stop between Lodeford and Chenworth?"

"Oh, yes! The engine wanted water, so we were obliged to stop at a little station rather more than half-way between. You must have been very fast asleep not to notice it."

"So I was. Did any one get in?"

"Yes; strangely enough, there was one passenger—a lady."

"Thank you—that is all I wanted to know. Good night."

As I threaded my way back to Reggie and the luggage I rapidly strung events together and came to a conclusion. The lady, in getting in, must have gently moved my feet in order to reach the other side of the carriage. This no doubt partially roused me. I probably half-opened my eyes, caught sight of the hand that was touching me, and so mingled it with my dreams. Much relieved by this reflection, I was able to enjoy the drive home with Reggie; but I did not say anything of my adventure.

Cedeville Manor is a fine old family mansion. It looked stately and cold on that dark winter day, standing amidst the snow-covered walks and bare leafless trees; but I soon found the cold stateliness was all on the outside.

Inside were warmth and light, bright faces and merry voices. My welcome was even more affectionate than I had dared to hope. I was passed from one to another to be kissed and caressed, till Lady Cedeville herself finally carried me off to my room, and left me in peace to dress for dinner. When that operation was performed, I heard a light tap at my door, and on opening it, found the youngest of my new sisters-in-law, Louise. She was as sweet a girl as bright eyes, flowing curls, and a warm heart could make her. When we went down-stairs, I had leisure to observe the rest of the family.

There were Lady Cedeville, tall and dignified, but with a kind, motherly manner; Minetta, her eldest daughter, also tall and dignified, engaged to the fair-haired young Captain leaning over her chair; Marian, the second, gentle and fragile, seldom off the couch; and Louise, already described, not long emerged from the school-room. Of the sons I thought Sir Henry, the eldest, rather stern in manner, but very polite, and particularly attentive to his mother. Frank, the second son, was away at sea; and Reggie, the youngest, with curling brown hair and eyes to match, sensible about most things, but infatuated on one point, need not be more minutely described.

I spent a very pleasant evening, and that night enjoyed the dreamless sleep of good health and a light heart.

The next morning Louise came down to breakfast with a very doleful face and a pair of very red, swollen hands.

"I don't know how it is," she said, holding them up to view, "that my hands get so much redder than any one else's. I have tried glycerine, chilblain ointment, and all the rest of it, but without result—on the first frosty day I am just as bad as ever. Can no one suggest any cure?"

We all sympathised with her, and many suggestions were made, all of which Louise promised to try in turn.

"By the way," said Captain Lewis—Minnie's intended—"what became of that governess of yours, Louise, that I met here last year? She had the whitest hands I have ever seen—almost too much so, in fact. Where is she now?"

I noticed a sudden silence fall over the party at this question. I noticed Louise grow a shade paler; and every one looked fidgety till Lady Cedeville came to the rescue by saying—

"She left us at midsummer; Louise had quite grown out of the school-room by that time."

Then the conversation turned upon other topics—but Louise spoke no more, and seemed to have suddenly lost her appetite.

After breakfast she offered to show me over the house. The last room we came to was long, low, and pleasant-looking, with book-cases all round it and a bright fire in the grate. Louise drew me in and shut the door.

"Come in, Nellie," she said. "This is my old school-room. It is called the library now; but I like the old name, and I love the room better than any in the house."

She placed an arm-chair by the fire for me, and threw herself on to the rug at my feet. From talking of the school-room we went on to school-days. I told her some stories of mine, and asked her how she had liked hers. To my surprise and sorrow, the only answer was a sudden burst of tears; and then the story came out at intervals and through the sobs.

"Did you notice, Nellie, how queer we all looked this morning when Arthur asked that question about my governess?"

"Yes, I noticed, dear; but don't tell me anything that distresses you."

"No, it won't distress me, Nellie. I should like to tell you, as you are to be my sister. Listen, then. Miss King was her name—my governess; but she was not like a governess, Nellie—she was more a dear friend, an elder sister. I cannot tell you how fond I was of her. Very few people in the world came before her in my affections; she understood me so thoroughly, and was so gentle and patient with all my faults. She had had a great deal of trouble in her life, and that made her depressed in spirits, and quite strange in her manner at times. We thought nothing of it at first, but of late years it increased so much that mamma consulted the doctor, and then, Nellie, the truth came out—she was going out of her mind! We did all we could. She was sent away for a long holiday, surrounded by everything bright and pleasant, and came back again apparently quite restored. But about the time of Reggie's engagement she broke out again far worse than ever; and," added Louise, suddenly kneeling and taking hold of my hand, "her madness took a curious form, Nellie. It was love for Reggie."

I felt a queer shiver run through me at this point, but I made Louise go on and tell me all.

"Well, it was the day Reggie wrote to tell us about you. Mamma read the letter out at the breakfast table. We were, of course, in great excitement when, in the midst of our talking and laughing, I saw Miss King suddenly turn as white as death and leave the room. I followed her upstairs. She locked herself into her room, and I could hear her pacing up and down, and saying, in a voice that makes me shudder even now, 'He shall never marry—never, never, never, while I live!' There she remained the whole day, refusing to open the door or to take any food. Towards evening the sounds ceased. We forced open the door, and found her lying in a dead swoon on the ground. From that hour she was raging mad. They took her away soon after, and she is now confined in a lunatic asylum not far from this. No hope is given of her recovery—and oh, Nellie, how I loved her!"

The sobs came thick and fast now, and I let the poor child cry, not liking her the less for the warm, faithful heart which prompted such tears.

After that the days sped by swiftly and pleasantly. I never was so happy in my life. To see Reggie, to be with him all day and every day was enough in itself to account for it; but, besides this, nothing could exceed the kindness of the whole family, especially Louise, who became almost more than a sister to me. Christmas Eve drew on, and a large party of friends and relatives were invited for the occasion. In the course of the evening the conversation turned on ghosts. All were expressing their opinions, some utterly scouting the idea of their existence, others declaring, with a little affected shudder, that they "really half believed in them." I did not join in the conversation, though I noticed Reggie often looking half-expectantly in my direction. At last he quietly left his seat and took one next to me, and, when the conversation was at the loudest, he said, in an undertone:

"Nellie, do you believe in ghosts?

"Why do you ask, Reggie?"

"Because," he said, "there is a legend in the Cedeville family that, if anything extraordinary is to happen to any member of it in the course of the year, a ghost appears on Christmas Eve. The place of its appearance is an old gallery hung with ancestral portraits at the top of the house. Now I do not in the smallest degree believe in the legend, but still I have a fancy, a strange fancy, to pay a visit to my ancestors every Christmas Eve. No one in the house knows of this habit—they would only mock at it if they did; so hitherto I have always gone alone. This evening I want you to come with me. Will you, Nellie?"

"I will go," I answered, looking into his brown eyes.

An hour or two later I found myself following Reggie up curious winding stairs to an out-of-the-way back part of the house where I had never been before. Presently we reached a long, high, narrow room smelling strongly of dust and moldiness.

"Here we are," said my guide, holding the candle high that I might have a good view. "No ghost yet. Allow me to introduce you to my ancestors;" and he began explaining the curious old portraits of all ages and in all varieties of costumes.

Suddenly, as I was gazing at one old lady with tower-like headgear and a waist in close proximity to her arms, I felt my wrist grasped by Reggie. I turned quickly. He held the candle on a level with his face, and I could see that it was ghastly pale, while his eyes were fixed with an expression of wild fear on some object at the other end of the gallery. At the same moment a cold blast from the open door sweeping in blew out the light, and we were left in total darkness—only for an instant though. As our eyes became accustomed to it, we could distinguish a faint bluish light at the far end of the room, and in the very midst of the light stood the tall white figure of a woman. She was motionless as a statue, her left hand was stretched out, and the first finger pointed toward Reggie.

For a moment I thought I must have sunk to the ground as my eyes fell on that hand. I knew it so well—long, thin and very white, with a deep red mark right across it—again, most unmistakably, the hand of my dream! For about three minutes she stood so; and then, as it seemed, noiselessly disappeared. After she had gone, we remained as if rooted to the spot, till the firm conviction that was tugging at my heart broke forth in passionate words:

"Reggie, that is no ghost, no spirit! It is a woman—a living woman! I have seen her before—I know I have!"

In my excitement I would have pressed forward, in spite of the total darkness, to the spot where she had stood, but Reggie held me back.

"It would be useless now, Nellie," he said—and his voice sounded hoarse and broken. "Nothing can be done in this darkness. Wait till daylight, and the place can be examined."

"What—and have us all robbed and murdered in our beds? Let me go, Reggie—let me go!"

But he would not let me go; he held me tightly with his arms around me, and he laughed a little as he whispered—

"If any one is murdered, it will be me, for the finger pointed towards me; but I have no fear. Nellie, you are trembling like an aspen leaf, and you are as cold as an icicle; for my sake, darling, come away—for my sake!"

That plea was not to be resisted. I suffered him to lead me quietly out of the room, down the dark winding stairs, into the light and warmth of the other part of the house. Not till the next morning did we tell of our adventure, and then it was received with a provoking amount of incredulity. However, after breakfast, we succeeded in forming a party for the examination of the premises.

"Shall we go armed?" asked Captain Lewis, producing a formidable-looking revolver.

"By all means!" laughed Reggie, who seemed to have quite got over his first fear, and to be convinced that some one was playing a trick.

But no such thought consoled me, as I followed the rest of the party up to the north gallery. Arrived there, we pointed out the spot where the figure had appeared. Captain Lewis examined it carefully; he pushed away some of the pictures from one side of the room, but nothing could be seen but an old damp-looking wall. Still undaunted, he examined the other side, when presently a loud exclamation startled us all. He had lifted up one of the heavy portraits hanging at the end of the room, and, on touching what seemed a tiny black speck in the wall, a little door flew open, and revealed a small closet behind. This, again, communicated with a long passage, ending in narrow steep stairs, which were found to lead right down to another secret door opening into the back hall. One and all, we crept through the aperture, and down the passage, scarcely wide enough to admit one at a time, and so low that we were obliged to bend almost double.

When we were all assembled in the back hall, we could do little but look at each other in blank amazement, till Sir Henry came to the rescue by explaining that many old houses were built with these secret passages; he had heard that this house was quite a famous hiding-place in Jacobite times, but he had never known of this particular passage before. Still this did not explain the mystery of the preceding evening, nor did it at all relieve my mind. Inquiries were instituted, but without success—no clue could be found to the perpetrator of the "trick," as everybody would persist in calling it. The affair became a nine-days' wonder, and then died out altogether.

Not so with me however—all real enjoyment of my visit was over. I dared not communicate to any one the terrible anxiety gnawing at my heart. Night after night I lay awake reasoning with myself, but the awful presentiment of evil seemed to be hanging over me, and I could not get rid of it. People began to notice my pale looks and nervous manner. Reggie grew quite unhappy about it—and this he told me one day when we were walking out together. It was our favorite walk round by the cliffs. The sea looked grand on that day, with the dark, melancholy grandeur of a winter sea. There was something almost ominous in the sound of the waves upon the beach and the wailing of the wind among the trees.

"Tell me all about it, Nellie," said Reginald. "You are ill—I know you are. You are unhappy—miserable; to see you so makes me wretched. Whom should you tell if not me? Why won't you confide in me?

Then my resolution was taken, and I determined to tell him all.

"Let us sit down, Reggie," I answered. "We are well wrapped up—the wind will not hurt us."

So we sat down on an old rock, with the gray sky above us and the sea sobbing at our feet, and I told him all—of my dream, my strange fellow-traveler, and the unmistakable identity of the hands. He listened patiently till I had finished, and then he put his strong brave arm around me and drew me very close to him.

"Nellie, my treasure," he whispered, "you need not fear dreams, presentiments, or anything else. With Heaven's will nothing shall separate us—nothing, nothing but death."

Even as the word passed his lips a wild shriek rent the air. We started up and looked eagerly round. While we were talking the tide had been so rapidly rolling in that it had almost reached the rock where we were sitting. Many were already nearly covered. On one of these latter stood the solitary figure of a woman, frantically gesticulating and calling loudly for help. She was in imminent danger. In a few moments more she must inevitably be swept away.

Quicker than thought Reggie had taken in all this—quicker than thought he had thrown off his coat, and was even now wading towards her. In the wild selfishness of the moment I would fain have recalled him, but he heeded not my imploring gestures; a human life was in peril, and he might be the means of saving it. On and on, nearer and nearer, he progressed, till, just as he reached her, a huge billow rolling in enveloped them both; then, as it passed on, I watched for some seconds which seemed like hours the rising and falling, the struggle between life and death.

If Reggie had been alone, he could easily have battled against the waves, but the clutch of the drowning woman and his efforts to keep her head above water weighed him down and clogged his progress so that I felt both must be lost. Just at this awful moment two coastguardsmen, attracted by my cries, appeared on the scene, and in another instant four figures were in the water instead of two. Then a mistiness crept over my eyes, and, though I still stood rooted there, I knew nothing of what happened till I felt some one pull my sleeve. It was one of the coastguardsmen, dripping from head to foot, and looking very much exhausted. He did not speak but only pointed to two objects lying on the dry sand a little way off.

"It is Lady Cedeville's son," said the other man, coming up—"Mr. Reginald; who will prepare the poor mother?"

Then sight and speech seemed to return to me suddenly.

"I will!" I cried, not heeding the pitying looks of the men, not heeding anything but the madness that seemed coursing through my veins like fire as I rushed on, on, till I reached the gate of Cedeville Manor.

Lady Cedeville was walking up and down the avenue. I ran up to her and clutched hold of her hand.

Mother," I cried, using the first word that came from my agonised heart, "your—Reggie——"

I saw her turn as white as death, I saw her fix her eyes on me and ask the question which her lips refused to utter, I felt my head reeling, I felt my senses going; but I had no pity for the bereaved mother then, no pity for any one but myself, as I shrieked out—

"He is dead—dead—dead!"

It seemed to me that the trees, the earth, the sky, the whole air took up and re-echoed the cry and with it still whirring and dinning in my ears I fell down on the cold damp grass and was for the time lost to all outward things.

They told me I went from one fainting-fit into another, and it was not till two days later that I came to my proper senses again; then I found myself in my own little room, Louise sitting on a chair by the bedside. She too looked dreadfully ill, poor child. She was leaning back in her chair, and I could see the tears rolling down from her closed eyelids; but as soon as I touched her she started up and brushed them away.

"Louise!"—"Nellie, my sister!"

"Yes, we shall be sisters, Louie—sisters still." She bent over me, with a wealth of pity and love in her dark eyes. "It will not be long, Louie, I think," I said, lifting my head wearily—"not long; you know I cannot live without him. I cannot—I cannot!"

"Don't speak so, Nellie. Heaven is very merciful."

"Heaven is very merciful, therefore I shall be taken away. I shall not be left all alone in this cold world. I could not bear it, little sister. Having tasted the sweetness of love, I could not live without it now."

"You shall not, Nellie. Heaven has many ways of showing mercy." And, so saying, Louise gently drew back the curtain and stepped aside.

Had the dead come back to life? Almost, I think; for my own Reggie stood before me. That afternoon I rose and dressed. The excitement of great sorrow, succeeded by the excitement of great joy, left me weak and faint. One thing puzzled me. Louise still looked downcast and unhappy without apparent cause. She came into the room just as I was dressed, and a sudden thought struck me.

"Louie," I said, "tell me what became of the woman Reggie tried to save. Is she alive, too?" I saw she tried to evade an answer; but I would not be put off. "Tell me, Louie. I would rather hear the worst at once."

"She is here, Nellie."

"In this house?"

"Yes—all that remains of her."

"Will you let me see her?"

"Better not, Nellie."

"Nay, little sister, but I wish it."

Without another word she led the way into an adjoining room, where lay the dead body. I looked down on the calm white face, with the black hair brushed softly back, and then I looked farther—to the hands crossed on the still breast—and my heart seemd for an instant to cease beating. The left hand lay uppermost. Scarcely whiter in death than in life, with the deep red mark reaching from the wrist to the middle finger, once more, and for the last time, I saw the hand of my dream. When I looked up, Louise was standing opposite me, gazing wistfully at the dead form.

"Ah, Nellie," she said, as our eyes met, "I may well be sad! It is my late governess and dear friend, Miss Klog."

So the mystery was solved. My fellow-traveler, the apparition in the north gallery, and the woman lying dead before us now were one and the same. She had escaped from the lunatic asylum, had traveled down to Chenworth, and, knowing all the ins and outs of Cedeville Manor, had appeared in the north gallery on Christmas Eve, apparently to warn Reggie. What she intended in her madness to do, or whether she had any settled plan to frustrate his marriage, will on this earth never be known, but her words came true—Reggie did not marry in her lifetime. They buried her in the little village churchyard, and erected a plain white stone to her memory. Reggie and I often walk there in the still summer evenings. We talk of the poor young creature whose life was so sadly blotted out, and of Heaven's great mercy to us.

CORA.

When Harold Sinclair was alone he threw himself into a chair, and gave himself up to deep thought. Recalling in his mind many an incident during Lord Almane's stay at the Tryst, it seemed to him now almost impossible that he should not have suspected some attraction which detained this brilliant young nobleman in their quiet home long after he was sufficiently recovered to leave it.

"Dolt that I was to risk her happiness so carelessly!" he exclaimed. "Has he touched her heart I wonder; it is almost impossible that it can be otherwise. My poor Cora!"

Harold remained some time in this state of painful meditation, and then moved by a sudden resolve, caught up his hat and started for town, making his way to the studio of a young artist—a man of good family and considerable talent, with whom Harold was intimate.

He found George Leeson at home and busily engaged on a large painting of "Rebecca," which he destined for the Academy, and which as yet had not made much way towards completion.

"Welcome, thrice welcome, old fellow!" he exclaimed. "I was just wishing some one would look in and prevent me from working myself to death. Look at my 'Rebecca.' Lady St. Maur sat for her. Is she not beautiful? I had to put some warmth into the face, however, for her ladyship is an icicle, notwithstanding those great black eyes of hers, which look so full of softened fire. What do you think of her?"

"It is a glorious face," Harold answered, surveying the painting with a professional interest; "and rarely beautiful. I have not seen you for an age, Leeson."

"No, I was just wondering what had become of you. Well, have you made up your mind for Rome, Sinclair? I am quite willing to risk malaria, and go in the summer for such an opportunity as Martinucci offers us."

"I have not thought about it lately," Harold said, throwing himself into a chair and watching his friend's skillful fingers as he wielded his brush. "I have been over head and ears——"

"In love?" interrupted his friend, with a laugh.

"Nonsense" said Harold, testily. "In arrears of work; and you know, Leeson, I am not so free to come and go as you are. There is Cora."

"Rome would not do for her in summer," said Leeson, gravely. "That sweet bloom of hers would soon fade there. But it is a thousand pities that one should lose such a chance of studying anatomy."

"True," mused Harold, who was more intent on Lord Almane in the flesh than any anatomical studies just then. "We have had an unexpected visitor at the Tryst," he went on, after a pause. "Lord Almane was thrown from his horse, and seriously hurt at our door, and has been with us for three weeks."

"Who?" said Mr. Leeson, pausing in his painting, and looking up.

If George Leeson had a weakness it was for a title, and he was not a little proud of his relationship to one or two peers, while his knowledge of "Bourke" was profound.

"Lord Almane," answered Harold, with an affected indifference.

"Stanley St. Roger, tenth Viscount Almane," said the other, nodding his his head. "I know."

"Do you know him?" queried Harold.

"I have met him once or twice. Is not his a splendid face? Purest Norman type I ever saw."

"Do you know much of him?" said Harold, hiding his anxiety under an assumed indifference.

"Only that he is one of the handsomest men of the day, and a king of fashion," answered Mr. Leeson, with a touch of contempt. "He is a clever intellectual man, however, and tolerably well liked, I believe. Of course, he is a great favorite with the fair sex. I have heard also that he has sown a tolerable crop of wild oats, and rather materially affected his fortune, which was very large when he inherited it at one-and-twenty, having accumulated during a long minority. However, that will be easily repaired."

"How?" asked Harold.

"By a rich wife, my friend. Stanley St. Roger seems born with a silver spoon in his mouth, for he has wooed and won one of the richest heiresses now in London market. A pretty creature, too, though a little insipid. He is engaged to be married to his cousin, Lady Lucy Belmont, and the engagement was announced in the Court Journal about three months ago."

CHAPTER V.

A LITTLE MUSIC—UNDER THE ELM.

Harold left George Leeson's studio anxious and ill at ease, totally at a loss as to the best course to pursue. Marianna's words had been so significant and earnest that he felt almost certain that Lord Almane had spoken love to his sister; at the same time was it possible that he, a man bound by every tie of honor to another woman, a woman, too, his equal in rank and fortune, should have stooped to try and win an affection which he could not return?

Harold, with his simple, old-world notions of a man's honor and truth, his veneration for the sex to which his mother and sister belonged, could hardly believe that it could be so; he had liked and trusted Lord Almane much too easily to credit anything to his disadvantage.

"Marianna must be mistaken," he mused, as he went back to The Tryst. "The child would have told me if it were so; she would not keep such a serious thing from me. He could not—he could not have betrayed my trust so basely. If she loves him—I pray Heaven that she does not—it will be my fault not his. Cora, oh, Cora! I who so longed for your happiness."

Sorely perplexed and distressed was the young artist. Had both his friend and his sister deceived him, and was Cora to be the sufferer for his carelessness and blind confidence? Until his sister confided in him he was powerless to act; he could neither upbraid his lordship nor inquire what his intentions were—that momentous question which is not always so easily answered as asked. Neither could he let Lord Almane suppose that he did not trust Cora fully and completely. It was a very heavy heart that Harold Sinclair took back to the Tryst.

He found his sister and Lord Almane sitting in the dreamy twilight in the pleasant old-fashioned drawing-room. Cora, sitting at the piano, in an evening-dress of some fleecy black material, with a scarlet geranium in the shining folds of her dark hair, made a pretty and attractive picture.

The Viscount was reclining in a deep arm-chair. Neither appeared to be speaking much, but there hung over the room an atmosphere of happy silence which did not quite please the anxious brother.

Cora rose to meet him, and the innocent glance of the sweet gray eyes went like a stab to Harold's heart. Lord Almane gave him a few pleasant words of greeting.

"What a truant you are, Sinclair! Have you been painting all the afternoon, or have you been up to town?"

"I have been to London," Harold answered trying to speak unconstrainedly. "I went up to see a brother artist, whom perhaps you know, Lord Almane—George Leeson."

"I fancy I do know the name," Lord Almane replied, indifferently.

"He is painting his long-talked of 'Rebecca,' Cora," continued the artist. "Lady St. Maur sat for him; she must be a beautiful woman."

"She is exceedingly handsome," remarked the Viscount. "One of the reigning belles, and has been ever since she was presented, five years ago."

"Do you know her?" said Cora, turning to him.

"I know her very well," he answered, with a slight smile, which the darkness hid. "We meet very often, and I admire her immensely."

After this there was a short silence. Cora, sitting on a low seat by her brother, played uneasily with a scarlet blossom in her breast.

"Why don't you ring for lights, Cora?" Harold said, as he walked towards the bell and rang it.

"Blind man's holiday was so pleasant," she replied, a little confusedly.

In a few moments Marianna appeared with lights, and then the chit-chat recommenced until dinner was announced.—[To be continued.

RECENT LITERATURE.

The Poetical works of Percy Bysshe Shelley [with copious notes.] Edited by Mrs. SHELLEY: With a Memoir. Four volumes in two. 12mo., pp. 1552. $3.00. New York: Hurd & Houghton.

The publication of a new edition of SHELLEY'S poems has revived an interest in one whose brief life shines brighter with passing years, and whose memory continually grows dearer to those who are willing to judge a tree by its fruits, and a man by his deeds.

SHELLEY was born in Sussex County, England, in 1792, was the eldest son of Sir TIMOTHY SHELLEY of Castle Goring. His education was commenced while he was quite young and at 13 he was sent to Eton where he remained three years. His hatred of oppression and willingness to suffer for the right, showed itself at this early age in his refusal to fag, for which he received harsh treatment from his school-fellows, but by his determined spirit of resistance and uniform kindness he at length won their respect.

During his stay in Eton he seems to have had ambition to enter the literary field, and indeed in his 15th year wrote two romances. That they were written, and that they were crude and romantic, as might have been expected from his years and nervous temperament, is all that is remembered of them.

But he did not neglect his studies, and was well prepared, in 1810, to enter University College, Oxford. Here he devoted himself to the study of physics, and spent much time in the Chemical Labratory. Several accidents, consequent either on his carelessness or want of knowledge, aided doubtless in his abandoning this branch of education and taking up Metaphysics instead.

About this time he read the works of HUME and others of the same character. His nature was such that to believe a principle was to become its defender and champion. With the impulsiveness of youth he became so earnest in his advocacy of the atheistic doctrines, taught in the books he now devoured, as to be offensively aggressive. So clear to his immature mind, seemed the fallacy of the generally received ideas, that he set about converting the world at once—and published an argument full of false logic and indiscreet assertions calling it The Necessity of Atheism. This resulted in his immediate dismissal from the College and the refusal of his father to receive him at his home.

Such treatment was not the best for one of SHELLEY'S temperament. If at this time a spirit of kindly affection and Christian charity had been shown him, the result would doubtless have been much different. Angered by what he felt to be unjust censure and oppression by the college authorities, his father, and his friends, he went to London almost penniless, but strong in the belief that he was a martyr in a righteous cause, and determined to go on in the way he had commenced.

In London he read Godwin's "Political Justice," a work almost as radical in its way as were those of a theological nature with which he had become acquainted at Oxford. His sisters (who were at school near London) divided with him their pocket-money, which they sent by one of their schoolmates, HARRIET WESTBROOKE, the daughter of a retired coffee-house keeper. His acquaintance with her soon ripened into intimacy, and resulted in wedlock.

Influenced in some way not recorded, SHELLEY'S father had relented sufficiently to allow him a small income; but after learning that he had made a Gretna Green marriage with Miss WESTBROOKE (supplemented, however, by a public marriage at Sussex) this was discontinued. It is said that thereupon the bride's father, proud of an alliance with a noble family, furnished the youthful pair—he was 19, she 16—with the same amount his father had formerly given him.

Notwithstanding the cloud under which SHELLEY lived, he formed the acquaintance of such men as SOUTHEY, LEIGH HUNT, DE QUINCEY—men who could perceive genius and goodness and right-mindedness in one who had some opinions with which they could not agree, and whose society could not fail to be of service to him in various ways.

He seems to have lived but a short time in any place, until in 1812 we find him again in London. Here his first child, IANTHE ELIZA, was born. An estrangement—for some cause not known—had been slowly growing, which culminated in 1813; and his wife left him and returned to her father. Soon after a second child was born, who died in 1826.

SHELLEY'S admiration for the work on "Political Justice," and others of the same character, induced him to seek the acquaintance of their author, WILLIAM GODWIN—whose wife was MARY WOLLSTONECRAFT, known as one of the earliest advocates of Woman's Rights. She held much the same views of marriage as SHELLEY expressed in his "Notes to Queen Mab." That her daughter, Miss GODWIN, was also a believer in the doctrine of elective affinity, may be presumed from the fact that she eloped with SHELLEY in 1814. They visited Switzerland and other parts of the Continent, returned to England in 1815, were again in Switzerland in 1816, and returned to England in the same year, bringing with them their child. He then learned that his first wife had committed suicide by drowning. No cause for the act has been made known. The effect on SHELLEY was such as for a time to deprive him of reason.

Later in the year 1816, he and MARY WOLLSTONECRAFT GODWIN were legally married, and about the same time his father, having succeeded to the ancestral estate, made him an allowance of £1,000 a year.

After the death of his first wife, SHELLEY desired to regain possession of his children, who had lived with their mother, but was denied by the Court of Chancery, on the ground that he was an atheist and as such was not a proper person to have control of children. During his residences in England, from 1815 to 1818, he wrote several of his poems among which were Alastor and the Revolt of Islam.

In 1818, seeing how fruitless were his endeavors toward regenerating society, and fearing the courts might take from him his son by his second wife, he left England to make his future home abroad. The remainder of his life was mostly spent in Italy studying and writing.

While he was yet at Oxford at the age of 18 he wrote Queen Mab—a production which was full of his sentiments and ideas at that time. He did not publish it, and only circulated a few copies privately. In 1821 some persons without his knowledge or consent and much to his displeasure printed an edition. He endeavored to have it suppressed by the courts but without avail, being told that the only notice a court could properly take of an atheistical work was to punish the author.

SHELLEY was drowned in 1822 by the capsizing of a pleasure boat in which himself and a friend were making a trip from Leghorn to Lerici. His body was washed on the shore of Tuscany. In accordance with the sanitary regulations of that State which direct that everything washed on the shore from the sea should be burned, to prevent infection, his body was cremated in the presence of LEIGH HUNT, Lord BYRON and Mr. TRELAWNEY. The ashes were carefully gathered and deposited in the Protestant cemetery at Rome. Thus at the early age of thirty he passed from earth.

Few lives have been so little understood and appreciated, and few memories so unjustly defamed as that of SHELLEY. The errors of his boyhood have been counted as crimes. Be it remembered he was only eighteen when he wrote Queen Mab. Shall the impetuous imaginations of youth always stand against him? Shall the ideas of marriage recorded by a boy of eighteen, be used to blast his character during his whole life?

SHELLEY'S soul reverenced what he chose to call the "Spirit of Nature"—in distinction to the God of anger, a merciless God, as taught him in the churches; but this spirit was his God eternal, invincible, and immortal. He could not conceive that matter more than spirit had any beginning. But is it not time that we remember a man can not believe just what he pleases; that there are honest convictions in the minds of one, diametrically opposed by the convictions of another just as honest. We do not approve atheistic or Free Love doctrines as expressed in Queen Mab and the notes thereto. Neither, so we believe, did SHELLEY in his later days. That he did once is evident from the fact that, rather than retract them he gave up home, society, wealth, and probably a title and a seat in Parliament. "By their fruits ye shall know them." What was SHELLEY'S life? Those who best knew him bear witness to his gentleness, kindness and christian charity. One has written of him: "It was the cardinal article of his faith that if men were but taught and induced to treat their fellows with love, charity, and equal rights, this earth would realize Paradise." He looked upon religion as it is professed, and above all practiced, as hostile instead of friendly to the cultivation of those virtues that would make men brothers.

To promote "peace on earth and among men good will," was one of the chief aims of his life; with oppression of every kind, domestic political, or religious he waged war to the utmost extent of his powers. He believed "the place and time in which to commence the regeneration of mankind were here and now, rather than await the future life of which we have no absolute knowledge."

There have been several lives of SHELLEY written, all well worth reading, but we doubt if from any of them one can get so full and clear insight as to the real life and spirit of the man as from these volumes of his poems recently published, to which we commend the attention of the public. Here, in notes, are his own explanations of his views, and the editorial notes by Mrs. SHELLEY, full and abundant, leave little to wish for, unless it be that his prose writings could be given to us in the same beautiful style. L. A. R.

LITTELL'S LIVING AGE. The numbers of The Living Age for the weeks ending February 23d and March 2d have the following noteworthy contents: A French Critic on Goethe, by Matthew Arnold, Quarterly Review; Natural Religion, part IX., Macmillan; An Oxford Lecture, by John Ruskin, Nineteenth Century; March of an English Generation through Life, Quarterly; French Home Life, Blackwood; Macleod of Dare, by William Black, and Within the Precincts, by Mrs. Oliphant, both from advance sheets; The Great Fourfold Waterfall, Frazer; Doctor Lavardin, a sketch, Macmillan; Shakespeare in France, Nineteenth Century; Erica, translated from the German of Frau von Ingersleben; Pleasant People, Saturday Review; Antoine Cesar Becquerel, Nature; The Cruelty of Pecuniary Crime, Spectator; Walking in Winter, Pall Mall Gazette; The Emotions due to Christmas Bills, Spectator; and the usual select poetry and miscellany. The back numbers containing the first instalments of "Erica," and a story by Miss Thackeray, are still sent gratis to new subscribers for 1878.

For fifty-two numbers, of sixty-four large pages each (or more than 3000 pages a year), the subscription price ($8) is low; or for $10.50 any one of the American $4 monthlies or weeklies is sent with The Living Age for a year, both postpaid. Littell & Gay, Boston, are the publishers.

DON'T rob your neighbor of his good opinion of himself. Crush a woman's self-esteem, and you make her cross-grained and snappish. Do the same with a man, and you only make him morose. You may mean to create a sweet, humble creature, but you'll never do it. The people who think best of themselves are apt to be the best. Women grow pretty in believing they are so, and fine qualities often creep out after one has been told one has them. It only gratifies your own momentary spite to force your own unfavorable opinion of him deep into another's mind. It never, never did any good. Ah, if this world, full of ugly people and awkward people, of silly people, and vain people, knew their own deficiencies, what a sitting in sackcloth and ashes we should have! The greatest of all things that a man can possess is a satisfactory identity. If that which he calls I, pleases him, it is well with him; otherwise he is utterly wretched. Let your fellow-beings alone; hold no truthful mirror before their eyes unless with a pure intention to uproot sin. So may a mirror without a flaw never be prepared for you.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

AN UNCROWNED MARTYR.

No outward sign her angelhood revealed,
Save that her eyes were wondrous mild and fair—
The aureole round her forehead was concealed
By the pale glory of her shining hair.

She bore the yoke and wore the name of wife,
To one who made her tenderness and grace
A mere convenience of his narrow life,
And put a seraph in a servant's place.

She cheered his meagre hearth—she blessed and warmed
His poverty, and met his harsh demands
With meek, unvarying patience, and performed
Its menial tasks with stained and battered hands.

She nursed his children through their helpless years—
Gave them her strength, her youth, her beauty's prime,
Bore for them sore privation, toil and tears,
Which made her old and tried before her time.

And when fierce fever smote him with its blight,
Her calm, consoling presence charmed his pain:
Through long and thankless watches day and night
Her fluttering fingers cooled his face like rain.

With soft magnetic touch, and murmurs sweet,
She brought him sleep, and stilled his fretful moan,
And taught his flying pulses to repeat
The mild and moderate measures of her own.

She had an artist's quick, perceptive eyes
For all the beautiful; a poet's heart
For every changing phase of earth and skies,
And all things fair in Nature and in art.

She looked with all a woman's keen delight
On jewels rich and dainty drapery,
Rare fabrics and soft hues—the happy right
Of those more favored but less fair than she.

On pallid pearls, with glimmer cool and white,
Dimming proud foreheads with their purity;
On silks which gleam and ripple in the light,
And shift and shimmer in the Summer sea.

On gems like drops by sudden sunlight kissed,
When fell the last large brilliants of the rain;
On laces delicate as frozen mist
Embroidering a winter window pane.

Yet, near the throng of wordly butterflies
She dwelt, a chrysalis, in homely brown;
With costliest splendor flaunting in her eyes,
She went her dull way in a gingham gown.

Hedged in by alien hearts, unloved, alone,
With slender shoulders bowed beneath their load,
She trod the path that Fate had made her own,
Nor met one kindred spirit on the road.

Slowly the years rolled onward; and at last
When the bruised reed was broken, and her soul
Knew its sad term of earthly bondage past,
And felt its nearness to the heavenly goal.

Then a strange gladness filled the tender eyes,
Which gazed afar beyond all grief and sin
And seemed to see the gates of Paradise
Unclosed for her feet to enter in.

Vainly the master she had served so long
Clasped her worn hands, and with remorseful tears
Cried, "Stay, oh, stay! Forgive my bitter wrong;
Let me atone for all those dreary years!"

Alas for heedless hearts and blinded sense!
With what faint welcome and what meagre fare,
What mean subjections and small recompense,
We entertain our angels unaware!

Golden Rule.

TALKS ON TIMELY TOPICS.—No. 6.

ROSE GERANIUM.

Perforated Card Fretwork.

FOR all pretty toilet accessories, boxes, receivers, baskets, and their kindred, we regard fretwork as extremely beautiful. Though of trifling expense and speedily executed, it has not the tawdry effect of some of the cheaper classes of fancy work.

The gilt card-board is quite handsome in its place—never more so than when fretted out in good designs and placed as a mat over a group of photographs in some neat, dark, home-wrought frame; or it is pretty as a border for boxes of white Bristol. But our own personal fancy is in favor of pure, ivory-white, either placed over silver or rose color. For the benefit of the uninitiated, we will try to describe the method of preparing it.

Lay a strip of card upon a smooth, poplar board. With your instrument, which should be narrow and sharp—a steel awl, ground at the point to a keen, flat blade, is excellent—proceed to cut down the depth of one perforation, quite along the edge. This will give you an army of tiny heads, crowded close together. Turn your blade and, cutting crosswise, remove each alternate one. This is pretty in itself! But we will carve farther, although we haven't the slightest prospect of carving our way "to fortune," or to anything more startling than a new fancy production!

You see the host of heads lying upon your board! Now, commencing in the next row, remove a duplicate for each—a mate in chart. Draw a bit of bright pink under your work, and it will look through even, square rows, in a way that will delight you.

Chip again—this time removing a little, somewhat triangular-shaped snow-flake, which will count three "heads" lengthwise and two downwards. To be very succinct, this "snow-flake," when it lies in your palm, must contain a cluster of four heads, grouped together as though you would build a pyramid with three stories at the base and one at the crown. We trust we have made our meaning plain.

After this pattern is wrought, if your ambition is gratified and you have worked quite around the edges of a suitable sheet, you can line it with color and arrange for a cornucopia; if the card be an oblong square, a design may be embroidered in the center and the whole applied to a box; or a space matching some bright chromo may be cut from the middle, a border fretted out like the first, and you have a cool-looking front for a small paper-receiver.

But if you desire a delicate, lace-like border, suitable for an infinity of petty purposes, we will go back to where we left off one pattern. We will go a step deeper and, turning this way and that, work around as closely as possible, scallop-fashion. Immediately below the deepest portion of each triangle, we must spare a single, isolated head. When the work is all complete and our border separated from the sheet, you will be literally amazed that you never thought of doing it before.

Very well, you didn't! Now, cut another strip and by fitting them together, various ways, you will unearth the mystery of making corners and also teach yourself a beautiful design for the body of a cross to be laid on pink for a book-marker; or, if wrought sufficiently large, placed over rich black velvet and framed. [*Note.*—If your finances admonish, you will find good black card-board a very respectable substitute.]

Small squares or circles, of narrow pattern, lined with silver paper and laid over white card (Bristol), will be found effective. And upon the same foundation, unlined, and laid fold over fold, a result can be produced which suggests the finest carving upon marble. Care must be used, however, that the tints and quality of the papers exactly match.

We have in our fancy, many exquisite patterns of leaf, letter and Mosaic, which defy the most deft flatteries of our pen; however, having once commenced, your own imagination will guide you to innumerable happy results.

THAT DRESS WHICH DID NOT IMPROVE.

MY DEAR MISS RIPLEY:—I wrote you last fall about my American silk dress which, after vast opportunities, had failed to improve. I was sorry to give an unfavorable account of any domestic manufacture; but truth demanded the statement I made; for, up to that time, that dress had not improved; and all this winter it has been in disgrace, relegated to a second-best-hand, which must have been mortifying after its seven years of first place, and no wonder it looked gruff and grim. Well, last week I concluded to see if anything could be done for it; and once more ripped up the skirt, then tried a new plan.

I put a tablespoonful of extract of logwood into two quarts of boiling water, dissolved it carefully, added the size of a Lima bean of copperas, dipped the silk in, wetted it carefully, folded and slightly wrung it out breadth by breadth, then dipped these, still dripping, into sweet milk, folded, wrung them lightly; half dried them before the fire, turning, folding and clapping them so that they should be evenly moist, then ironed them.

This process was troublesome, for the silk stuck to the iron unless it was quite hot, and this would scorch the silk; but I took irons as hot as seemed safe, ran them quickly over the silk, at first, then more slowly as they cooled; had some one hold one end of the breadth while I held the other to keep it stretched, I got them all smooth and nice; and, now, justice requires me to say that my silk does improve with judicious wear and care, and looks better to day than it did when first made up, and is thicker owing to the fact that it has shrunk from a dimi-train to a walking dress which clears the ground. It was too much trouble to rip up the basque, so I mixed the black dye and milk and sponged it, and it has a softer lustre than the skirt. It was not ironed, and the milk when cooked by the heat does not aid the lustre so much as when dried without cooking. So American grosgrain does improve with use, if it is used right, and the Cheney Brothers are not mere boasters.

True, thin silks do seem to resent being washed on a wash-board, in potash ley, hot and strong with plenty of soft soap; but one can scarce wonder at this, and it would certainly be well to omit that part of my treatment in any experiment made on these goods. I rather think it would have been better if I had removed the oil and paint with benzine or some other contrivance of that kind and kept the tar off it altogether without greasing it to get it out.

My present anxiety about "that dress of mine" is as to its future. Now that it has actually begun to improve, no knowing where the process will end. I would like to keep it in the family but have no grand-children and think of bequeathing it to the matron of some orphan asylum to be handed down with the office.

I have written these articles as though it were all a jest, because the endurance of that dress has long ago become comical, and a subject of surprise and merriment to my friends; but my statements are below, rather than beyond the simple facts of the case. In seven years and four months of such an amount of wear as few dresses get, the woof has worn through on the edge of two sharp folds which were exposed to unusual friction, but even in these spots the warp holds its own and my dress of '71 is a good and handsome dress to-day. People of moderate means, make a great mistake in buying showy, foreign goods when, for a less price, they can get an incomparable article of home manufacture.

JANE GREY SWISSHELM.

MARK TWAIN IN A NEW ROLE.—The Girl of the Period will no longer be compelled to bow at the shrine of Worth, of costume designing fame. America has produced a genius who promises to eclipse the great man of Paris in his ability to evolve miraculous toilets. In the March number of the Atlantic, Mark Twain, (the aforesaid genius) gives surpassing evidence of his talent in this direction, and for the benefit of our readers we reproduce the following description of a costume in which he arrays his heroine. "Her dress and adornment were marked by that exquisite harmony that can come only of a fine natural taste perfected by culture. Her gown was of a simple magenta tulle, cut bias, traversed by three rows of light blue flounces, with the edge turned up with ashes-of-roses chinelle; over-dress of dark bay tarleton, with scarlet satin lambrequins; corn-colored polonaise, *en panier*, looped with mother-of-pearl buttons and silver cord, and hauled aft and made fast by buff-velvet lashings; basque of lavender reps, picked out with valenciennes; low neck, short sleeves; maroon-velvet necktie edged with delicate pink silk; inside handkerchief of some simple three-ply ingrain fabric or a soft saffron tint; coral bracelets and locket-chain; coiffure of forget-me-nots and lilies-of-the-valley massed around a noble calla."

DESCRIPTION OF CUTS.

3392 is model of a sweeping cap. It is quite an addition to ones "sweeping toilet" and while protecting the hair from dust quite as effectually

4752

3392

as the odd bits of clothes women affect so much, it has the additional advantage of being infinitely more becoming.

No. 1.

At 4752 is shown model of gentleman's slipper, and No's. 1 and 2 are designs in embroidering for the same. If any ladies like this design I can

No. 2.

have it stamped for them on a piece of paper for 10 cents, or have the slippers stamped, for 25 cents. Price of cap pattern, 10 cents; slipper pattern, 10 cents.

TALK ABOUT MY JEWELS.

No. II.

MARGUERITE.

I AM beginning to learn that my children are to me mirrors—reflectors of myself in many ways. I do not refer to my outward appearance, but in heart and actions. I see GERTIE doing and hear her saying many things for which I correct her and wonder who taught her, but afterward find out that she was only patterning after her own mother.

People are constantly saying to us about our children, as they do to every one—often when they are only adopted ones—"They are just like their father!" Perhaps in half an hour the remark will be made by another that the children are the image of the mother.

I had been told that baby FRED looked like me until I fully believed it. Among the callers to see him was one lady who exclaimed, "Oh, he looks exactly like his father!" "Do you really think so?" I asked. "Yes, indeed. Any one can see that," she answered. "*He is white.*" I laughed to myself as she ran briskly down stairs, apparently unconscious of the compliment (?) she paid me. Since then I have not tried so much to trace the family resemblance, as to attend to the cultivation of the heart.

To the parents children are a bundle of joy and cares. Joy when the little arms twine about your neck, and the kisses are lavishly given you in return for yours, while the little prattler says, "I love you, dear Mamma." Cares when the sudden thump, thump, thump, tells you that FRED is falling down stairs; or when he climbs into the rocking-chair and leans over the back until it tips, and he falls screaming, to the floor; or when papa lies helpless in his room, and you leave him an instant to follow the truants to the pantry to find them pounding vigorously with a dasher in a six gallon crock of packed eggs.

One is ready to believe under such circumstances, that they are really "little troublesome comforts" until one thinks that there is danger of losing them, and then for the word "troublesome" we substitute *precious*, and then it does not express more than a shadow of the love that binds them to the heart. GERTIE came to me yesterday, saying: "Mamma, my throat is awful sore." What mother is not fearful of sore throat? My heart gave a quick beat, and I asked, "Where is your throat, GERTIE?" Placing her little hands across her stomach she said, "Here it is, Mamma."

The Querist.

ANSWERS TO CORRESPONDENTS.

Short-Horns or Durhams.

J. J. A. P., Cassopolis, Mich., asks:—"Is the Durham breed a family of the Short-Horns?" ANS.—No. It is simply an old name applied to the Short-Horns and associated with them—that is with the "Improved" or pedigreed Short-Horns. The ancient breeds out of which the breed came which we know as the Short-Horn, are natives to the North and East of England, particularly to the Shires of Durham and York. They are the Holderness, Teeswater, Yorkshire, and Durham, and it is from this connection that the breed has been known in this country as the Durham or Durham Short-Horn.

About Water Pipes.

W. H. W., Chenango Co., N. Y.—I have a spring about 120 rods distant from my dwelling house and barn, from which water has formerly been conducted in or through pine logs, which are getting very much out of repair and must needs be soon re-laid with modern pipes or those of some other material. About two-thirds of the distance from spring to house is pretty steep decent, the remaining distance water backs up. Any size caliber from ⅝ of an inch to 1¼ inches will answer my purpose. Now, I would like information on the following points: (1) What would be the best material, all things considered, to re-lay it with; iron, wood, lead, earthen or water-lime? (2) If wood is used, which would be the best kind of an augur to bore them with, viz: what is termed a pod or a screw-augur: if a screw augur; would one work the best with a square or flaring bit; or in other words, which is the most improved or approved kind? (3) Can logs or wooden pipe be purchased, and at what price per foot or rod and where? (4) If iron is to be used, which is best, the common or that which is galvanized? (5) If earthen, of what dealer purchased and at what price per rod or foot? (6) If water, lime, or cement, how should it be mixed and laid? (7) What is the best method of constructing a bench or frame where pump logs or wooden pipe is to be bored by hand, and the best kind of augur for the purpose?

ANS.—Will some of our readers who have practical experience with regard to the various questions here propounded, oblige us and our correspondent by furnishing the desired information? Our own experience is limited to the use of one kind of pipe only in this connection, and it would doubtless be useful to many of our readers to learn the respective merits of the different ones mentioned.

Diseased Hogs.

J. J. D., Woodson Co., Kansas.—I write to the RURAL to learn if it or any of its readers can give me any assistance in regard to my hogs. Last fall they were doing finely, but now most of them look gaunt and mopish and, in some of the worst cases, the skin around the hind legs looks loose and wrinkled. All of them look more or less scurvy and some are losing the hair in patches. Quite a number of the pigs have died and, on opening some of them, I found the intestines full of worms from five to ten inches long, of a yellowish color, and pointed at both ends. The hogs have a range of 60 acres of timber land with a creek running through it, also good sheds for shelter and they have had plenty of corn in the ear. I have fed them salt, sulphur, ashes, coal, copperas, turpentine, and charcoal, but as yet have found nothing to help them. If the RURAL can give a cure for this disease or to remedy it, we will be thankful if it will print it.

ANS.—Give more turpentine for worms. Use tobacco water, carbolic acid or soap for a wash. Have any of our readers fuller experience in this predicament?

Liquid Manure Tanks.

J. W. S., Attica, O.,—Will the RURAL please tell me (1), what kind of turnip seed J. R. of Freedom, Wis. used, and how much he put on one acre of ground? I saw his statement in issue of Jan. 12th, 27th page. Please tell me also (2), how to make a "liquid manure tank," and (3), how the urine will find its way in where the common plank floor is used.

ANS.—Construct a pit just as you would a cistern, either at, or to, a lower level than that of the dung heap, and let it be of sufficient capacity to contain not only the liquid excrements of animals, that may flow to it through a drain directly from the stable, but also the drainings of the dung heap. The bottom and sides of the tank should be rendered impermeable to water by means of a thick layer of clay, or much better, by a lining of brickwork and hydraulic cement. The manure is in this way prevented from penetrating the ground and the drainage from the roofs of farm buildings, rain and waste water is carefully excluded. In all cases, liquid manure tanks should be covered, both to exclude rain water and prevent the escape of their volatile riches. In addition to this, means should be taken to prevent the escape of ammonia by the use of what are known to be fixers of ammonia. Sulphuric acid and sulphate of iron, when they can be had at a cheap rate, are by far the most efficient materials for this purpose, one pound of of oil of vitriol being, on an average, sufficient for 150 pounds of liquid manure. The acid should be first diluted with water before being poured into the manure tank. Gypsum is another "fixer," but when it is used the contents of the tank should be frequently stirred up, as it is not easily soluble in water, while on account of its specific gravity, it readily settles at the bottom of the tank. Sulphate of magnesia also serves the same purpose.

(3.) Behind the stalls of the animals in the stable, there should be a slight trough or depression to receive the urine &c., that escape from the litter, and from the trough there should be a drain to convey the liquid voidings to their appropriate tank.

About Ewes Adopting Lambs.

R. N. Stockmeyer.—In past years I have suffered considerable loss by the death of lambs soon after their birth, and the refusal of the ewes to adopt other lambs; can the RURAL help me to avoid such losses in future, by suggesting some means of inducing the bereaved ewe to adopt another lamb? I have tried several plans, but with only partial success.

ANS.—Among the many methods of inducing ewes which have lost their lambs, to take to other lambs, the following two are said, on excellent authority, to have proved very successful: First; put the bereaved ewe in a small pen away from the rest of the flock. Hold her while the lamb suckles, and milk a little of the milk on the lamb. Repeat this four or five times a day, especially the last thing at night and the first thing in the morning, and almost invariably the ewe will take the lamb in a couple of days, if not sooner. Second; cut off a portion of the skin of the dead lamb and tie it over the neck and shoulders of the living one, wool side out, and the dam of the dead lamb will at once adopt the living one.

Subsoiling.

F. C. Mansfield.—I see a great deal in the papers about subsoiling. Is it beneficial for all lands, and if not, on which should it be applied?

ANS.—The object of subsoiling is to loosen the soil beyond the reach of the ordinary plow, and in this way subject it to the action of the air, allow the roots to go down and the moisture to come up. If the subsoil is a loose gravel allowing a free circulation of air, there is no use for a subsoil plow. If it contains substances injurious to plants, the first crop at least, would probably be injured by the loosening. If it is so wet that the roots of the plants cannot go down into it, it would not be worth while to subsoil it. Well-drained lands are most benefited by the operation, and, in nearly all cases, pay well for subsoiling. By subsoiling a few furrows and comparing the crop on them with that on the rest of the land you can best determine whether subsoiling will pay.

Sowing Clover.

Mrs. Mary McC.—Will the RURAL please tell me the best time to sow clover; and what fertilizers should be applied to it. Which is the best kind for plowing under?

ANS.—The best time to sow clover is probably in August. It should be sown on well-mellowed ground with a dressing of plaster, say ten bushels to the acre. The pea vine variety makes a very coarse hay, but it is probably the best for plowing under green. In the spring clover does very well sown upon winter grain or with spring grain, but it does better by itself. For light lands plowed in the spring to be sown with clover, suitable top-dressings are plaster, ashes, any fine compost, or Peruvian guano, made fine and mixed with plaster and soil, or superphosphate of lime.

Applying Fertilizers to Spring Wheat.

J. M. Davis.—Would it pay to apply a top-dressing of bone-dust or superphosphate to winter wheat in the spring?

ANS.—The increase of wheat alone would probably not pay for the manure; but besides causing an actual increase, bone-dust would so benefit the land for succeeding crops, that in the end the outlay would be amply returned. For immediate effect on the wheat, one of the best applications is a mixture of Peruvian guano and superphosphate, 150 lbs. each per acre. Sow it as early in the spring as possible. Sift the guano to get out all the lumps; then break them up and pass them through the sifter, as no lumps larger than a Marrowfat pea should be sown. Besides the increased yield of the wheat crop, the extra straw and clover resulting from this treatment, will be a valuable consideration.

Remedy for Heaves in Horses.

H. L. K.—Will the RURAL please publish again the recipe for the cure of "Heaves in horses"—Nitric acid and milk. It has cured some cases hereabouts. Indeed I never knew it to fail if taken in season. A RURAL reader in Mich. has a valuable horse that has heaves; he has never read that recipe, and he offered $50 for a cure. There may be many that take the RURAL, who are like him in regard to this recipe; and for the sake of that noble animal, the horse, please publish it again.

ANS.—The recipe here referred to was originally published on the authority of a Michigan farmer, in the RURAL for Sept. 14th, 1872. Since then several assurances as to its efficacy have been received, quite as strong as that from our present correspondent: give once daily a teaspoonful of aqua fortis, nitric acid, prepared as follows: mix it with a teaspoonful of sour or skimmed milk, mix this with bran and the bran with the grain fed. The catarrhal affections of the throat make rapid amendment under this treatment, which should be continued if necessary until a pound of acid is given.

Guano and Ashes.

C. L. M.—Would it be advisable to mix ashes with guano, as a manure for potatoes?

ANS.—No, as they would set free more or less of the already formed ammonia, especially if they were moist. Both might, however, be advantageously applied to potatoes, though care should be taken not to mix them before the application.

Miscellaneous.

A. Hoys.—Do you import Bermuda Grass seed? If so, what is the cost per bushel or half bushel? If you do not import, can you tell me who does?

ANS.—We have repeatedly stated in these columns, that *our sole business* is the production of the RURAL NEW-YORKER. Bermuda Grass is propagated by roots and joints. It does not produce seeds in this climate.

W. J. Gould.—Will the RURAL please tell me whether land plaster loses it manurial qualities by keeping?

ANS.—If it is kept dry, no change will take place in it to lessen its manurial value, and after months it will be just as good as if obtained fresh from the mill.

S. E. B., Pierson, Mich.—I wish to purchase two or three head of Jersey cattle and do not know any dealer in them. Would the RURAL please inform me of the names of two or three, and oblige.

ANS.—Col. M. C. WELD, 189 Water Street, N. Y. Messrs. SMITH & POWELL, Syracuse, N. Y.

Dennis Nelligan, Monson, Mass.—Having seen in the RURAL NEW-YORKER mention of a plant called Dipladenia Williamsii, I should like to get the seed of it, also the seed of Crown Imperial or Fritillaria, if they are house-plants. Can the RURAL please tell me where they can be purchased?

ANS.—Mr. GEO. SUCH, South Amboy, N. J., could probably supply Dipladenia and also bulbs of Crown Imperial. The latter is a hardy spring bloomer—the former a stove climber.

E. D. J., Auburn, N. Y.—Where can I procure a hand-mill that will make fine flour from the whole grain? I wish something that combines cheapness with excellence in work. Would I need a small bolting attachment? I suppose the ordinary coffee-mill does not grind fine enough?

ANS.—Yes. Write for circulars to Blymyer Mf'g. Co., Straub Mill Co., Cincinnati, Ohio, and to Nordyke, Marmon & Co., Indianapolis, Ind.; U. S. Wind Engine and Pump Co., Batavia, Ill. A postal-card will secure you complete information.

H. B. Knower, Westminster, Worcester Co., Mass.—Being a new subscriber to your paper I would like to ask through its columns, where I could get the Chinese Yam for seed; and what would be the price per pound, or if you would furnish them?

ANS.—We sell absolutely no seeds. Write to R. H. ALLEN & Co., 189 Water Street, N. Y.

Subscriber.—I value the recipes in the RURAL very highly, and wish to preserve them for future reference. I also wish to preserve my papers as nearly intact as possible. Could you not arrange to print the recipes on the back of some advertisements, or other matter of no value or interest for preservation, so that when cut out, the paper although marred in appearance, will not be intrinsically injured?

ANS.—We are always happy to receive suggestions from our readers. The above suggestion is good, but for reasons that it would not be interesting to explain, impracticable.

T. W., Kalamazoo, Mich.—Would the RURAL please tell me the address of Mr. WILLARD, who seems, according to its opinion, to be one of the most experienced men in the country on dairy matters?

ANS.—Little Falls, N. Y.

W. F.—Will the RURAL please tell me which are the best hens for winter laying.

ANS.—Brahmas are generally considered the most prolific breed in winter; though with this opinion there are some who disagree. Perusal of the valuable articles on poultry, that appear, from time to time in the RURAL, will give our correspondent full information concerning the merits as well as the best treatment of the different varieties of fowls.

S. H.—In the issue of the RURAL for Feb. 23, is a description of a "Cheap Poultry House," by S. RUFUS MASON. As I am about to construct a poultry house (a cheap one if I can) I would like if Mr. MASON would kindly give me, through the columns of the RURAL, a little further light upon the subject. What is the object of the two rows of posts, four feet apart? Is this what you call "the wall" which is to be filled in with straw? Is the roof to be perfectly flat? How are the windows arranged? If you could give a rude sketch of the house it would be a considerable help.

News of the Week.

CONDENSED NEW YORK TELEGRAMS.

TUESDAY, Feb. 26.—Vice-President Wheeler is ill. There is a rumor in Washington that a writ of ouster has been prepared to contest Hayes title to the Presidency. Louisiana has declared against all forms of repudiation and in favor of paying the State debt.

The Russians are massing their troops around Constantinople. The Czar while guaranteeing to Turkey that the Russians shall not approach nearer to Constantinople than San Stefano, declares that he has great difficulty in restraining the Grand Duke Nicholas from entering the city as a conqueror. Russia wants the Conference to meet, the first time, on on appropriate day—the first of April.

WEDNESDAY, Feb. 27.—Gen. Gourkha with 30,000 men, is marching on San Stefano, on the outskirts of Constantinople. The Russians are pressing Turkey to be allowed to enter the city; but the latter persistently refuses. A levy of 75,000 Bulgarian troops, just ordered, will be commanded by Russian officers.

THURSDAY, Feb. 28.—It is probable that the State Legislature will pass a law rendering the canals free. Gov. Halliday of Va. vetoed the bill virtually repudiating a portion of that State's indebtedness, and his veto has been sustained by the Legislature.

In England, Lord Napier of Magdala, of Abyssinian fame, has been appointed Commander-in-chief of any expeditionary force England may send against Russia, with Sir Garnet Wolseley, of Ashantee renown, as his chief of staff. Still talking earnestly of peace while actively preparing for war. The new Pope discourages visitors and pilgrims from speaking on political matters.

FRIDAY, March 1.—The amended silver bill was yesterday promptly passed by more than the needed two-thirds majority over the President's veto in both houses of Congress.

Despite the report of a better understanding between Great Britain and Russia, the former is straining every nerve to expedite preparations for war. The Porte has yielded to nearly all the Russian conditions of peace. Both Powers profess warm friendship! All see now what we said *last week*; that there is little use in a Conference and it is doubtful whether it will be held. The Italian Ministry has decided the "Papal Guarantees" granting the Pope certain immunities and a large annual income, are constitutional laws which Parliament cannot interfere with.

SATURDAY, March 2.—The Silver Bill will cause the coinage of three and a half or perhaps, four million dollars a month, and will increase the volume of currency, thus making money more free and it is to be hoped more easily to be got hold of by deserving folks like our subscribers and ourselves. Benjamin Franklin Wade, better known as "Old Ben. Wade," ex-Senator, and once acting-Vice-President of the United States, has just died at half-past six this a. m. at Jefferson Ohio, in his 78th year.

The Czar is impatient of the delay in signing the treaty, guessing that England is causing it, while pushing on her warlike preparations. Count Andrassy is about to ask 30,000,000 florins to prepare the army for emergencies. Canada will send 10,000 troops to the war in Europe, should England become involved in hostilities there. The Cuban insurrection, after a nine years' struggle, is now ended; the insurgents are all surrendering to the Spaniards who are treating them kindly. Much wrath and many charges of treachery and cowardice from some of the brave Cuban patriots who have been fighting carpet battles in this and other American cities, while a few of their courageous compatriots, a lot of run-away slaves and a number of foreign adventurers have been robbing, pillaging, sacking and now and then fighting in the "Ever-Faithful Island."

SUNDAY, March 3.—Glowing reports from the Black Hills; a reach of 60 miles of the richest mineral deposits yet found on this continent!

The British fleet on the Bosphorus are in great trepidation lest the Russians should send torpedoes amongst them. The Sultan has ordered the Governor of the Dardanelles to allow no more men-of-war—British, French or Austrian—to enter the Sea of Marmora. Russia has no objection to Austria's occupation of Bosnia and Herzegovina; but Austria fears that if she extends her territory in the south, Prussia may demand a smaller but more valuable slice of it at the north. King Humbert of Italy, has been invested with the English Order of the Garter. Ex-President Grant is expected at Rome from Egypt, on the 15th.

MONDAY, March 4.—The treaty of peace between Russia and Turkey was definetely signed on Saturday. Great rejoicing at St. Petersburg and Constantinople, and a sense of relief widespread throughout Europe. The Grand Duke Nicholas visits Constantinople to-day. The terms of the treaty are not promulgated, but it is understood that Russia makes considerable concessions: The Turkish fleet is not to be surrendered, Russia has abandoned her claims to the Egyptian and Bulgarian tributes, nor is there any interference with the portion of the Turkish revenue pledged to foreign creditors The money indemnity will be as large as formerly reported, but will take the form of territory in Asia, including Kars and Batoum, not Erzeroum. Bulgaria will have no port on the Mediterranean, and Salonica as well as Adrianople will still belong to Turkey. Numerous questions are left undecided till the Conference or Congress shall assemble, and Russia is then expected to recede from some of the extreme terms she has imposed in that expectation. England and Austria grumble and protest, especially the former, but what can they do about it? Pope Leo XIII was privately crowned yesterday at the Sistine Chapel in Rome, the cardinals, prelates, diplomats, and only a few other persons being present. Cardinal Franchi has succeeded as Pontificial Secretary of State to Cardinal Simeoni against whose reappointment several Catholic Powers and some cardinals protested on account of his reactionary tendencies.

Manufacturers of Clothing and ladies' suits find the New Davis Sewing Machine adapted to the full range of their work, trimming, binding, sewing thick and thin goods, over-seams, without any difficulty, and requiring no basting or change of tension. The DAVIS SEWING MACHINE Co. are enlarging their manufactory at Watertown, N. Y., to enable them to supply the increasing demand for their machines.

Reliable help for weak and nervous sufferers. Chronic, painful and prostrating diseases cured without medicine. Pulvermacher's Electric Belts the grand desideratum. Avoid imitations. Book and Journal, with particulars, mailed free. Address PULVERMACHER GALVANIC CO., Cincinnati, Ohio.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 2, 1878.

BEANS AND PEAS.—Receipts of beans past week, 2,293 bbls. Depression prevails in the general bean market. Mediums have not had the steady call that would have been noted if the winter had been colder, and the spring month finds us with an offering to some degree oppressive. The Cuban demand for marrows has been interrupted for several weeks and with this principal traffic restricted, prices are weak. White Kidneys are also quiet, they are apt to be dull when marrows are slow. Red Kidneys cannot be quoted in a large way; neither can Pea beans, Black hold their late slight advance. Plenty here. Canadian peas have a steady place at 83c. Green peas show no improvement, $1.15@1.20. Southern B. E. peas, $3.25 per two bushel bag.

We quote:—Beans, medium choice, $1.70@1.70; other, $1.45@1.55; marrows, choice, $1.85@1.90; other, $1.70@1.80; pea, $1.75@1.80. White kidney, choice, $1.70@1.80; other, $1.85@1.95; red, choice, $2.25@2.50; other, $2.35@2.40. Turtle soup beans, $1.50. Lima, $1.

BEESWAX.—Has been in freer demand for shipment and brings trifle better prices; Western and Southern quoted at 27½@28½c.

BROOM CORN has a freer demand from consumers and holds firm.

Green brush at 6@7½c.; green hurl, 5@6½c.; medium green, 5@6¼c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—March is here, and so is a good deal of unsold butter; and when there is danger of unsold butter becoming unsound as well, its owners are not apt to have very set ideas as to prices. The stock of medium grade, or what would be really termed common, in many other average crops, is daily taking in additions from current receipts, and there is a marked inclination to sell all stock below fine to good. It will be difficult to sell full dairies after this date, unless very seductive concessions are promised. It is very likely that holders of State dairies will carefully cull the table tubs and save the best firkins, in order to participate in the 25@35c. range, and let the remnant take its grease or export chance. A late spring may help some grades of stock now neglected. Western factory sells readily at the prices which receivers adopt. They keep them enough under serviceable State grades to attract close market and ordinary grocery buyers.

We quote State creamery, 25@35c.; fancy pails, 30@32c.; other 25@28c.; creamery, good to choice, 25@35c.; half tubs, fine, 28 30c.; extra, 33@37c.; other, 22@27c.; Fall Welsh 27@29c.; Welsh tubs, dairy, 25@27c.; other, 20 23c.; full dairies, fine, 28@30c.; common, 20@24c.; firkins, 20@27c.; poor State, 14@21c.; Western creamery, good to choice, 40@42c.; poor to good, 25@32c.; factory, choice, 20@21c.; good, 16@18c.; common, 7@11c.; rolls, 12@18c.; grease, 6½@7c.

Receipts for the week, 18,397 pkgs.

Exports past week, 925 pkgs

On March 6-8 the National Butter, Cheese and Egg Association will assemble at Chicago. This organization now numbers 700 members.

CHEESE.—The steady fair requirements for export, and a falling off in receipts, with stocks steadily diminishing, give a firm market, and prices not changed.

Exports for the week, 21,285 boxes.

Liverpool cable, 69s. Gold closes 101¾.

Receipts for the week, 10,167 boxes.

Fancy factories, 13¾ 14c.; good and prime, 13@14¾c.; fair lots, 12¾@12¾c.; poor, 10@10½c.; 7@10c., skimmed. Farm dairy, 12¾@13c. for good to prime; 11@12c. for fair lots; 8@11c. for skimmed; Western factory, cheddar, 13@13¾c. for fine 11@12c. for good; 6@10c. for poor.

COTTON has fluctuated sharply in sympathy with the English views.

Latest prices are for March, 10.88@10.89c.; April, 10.91@1092c.; May, 10.04@10.04c.; June, 11.15@11.16c.; July, 10.22@10.23c.; August, 11.28@11.29c.; September, 11.11@10.13c.; October, 10.95@10.97c.; November, 10.87@10.89c.; December, 10.89@10.91c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	8	8	8¼	8¼

Stained.

Good ordinary, 8 1-16c. Strict ordinary, 8 13-16c.; Low middling, 9 5-16c.; Middling, 9 15-16c.

DRIED FRUITS.—For medium and good grades of apples, peaches and small fruits generally, there is a steadier market, with increased demand from shippers.

Apples—State quarters, old, 5¾@6¼c.; new, 5¾@6¾c.; Western quarters, old, 6@6½c.; new, 5¼@5¾c.; Southern, new, prime sliced, 7c.; fair to good, 5@5¾c. Peaches—Peeled, new, 9@10c.; unpeeled halves, 4¾ 5c.; unpeeled quarters, 3¾@4c. Pitted cherries, 15@17c. Blackberries, 9@10c. Raspberries, 26c. Plums, 15c. and Southern at 12c.

EGGS.—Receipts for the week, 11,142 barrels. The demand is light. A good many consumers discard eggs just before Lent, as many are apt to get a surfeit of them before the Fast is over. Prices are easy, but not droop any, and if the heavy surplus of held stock were out of the way, strictly fresh would show some firmness. It is feared that the market will be perplexed with limed and State all the spring.

Near points, 16@16½c.; State and Pennsylvania, in good order, 15½c.; Western best, 15½c.; do. Southern, 15@15½c.; inferior and off quality, 10@13c.; State and Canadian, limed, 9@10c.; Western, 9@11c.

FEATHERS.—Live white prime Western geese, 45@47c., mixed, 30@40c.

FEED.—Is more freely offered and easier. Sales 40 pounds ave., $18.00@19.00; 60 pounds ave., $18@18.50; 80 pounds ave., $18@18.50; 100 pounds, $18@20; and rye at $19@19.50.

FLOUR.—The news from the other side has been of a threatening character, and has led to a larger business here, with prices stronger.

Latest prices are $4.25@4.85 for poor to fancy superfine State; $4.85@5.25 for common to fair extra do; $5.25@ .60 for good to choice do.; $4.25@4.85 for superfine Michigan, Indiana, Iowa, &c., outside for choice; $4.85@5.25 for shipping extra do., the inside price for poor, and $5.25@5.00 for good to strictly fancy extra do.; common to choice white wheat extras, $5.50@6.75; fancy do. at $6.75@7.75; red and amber winter wheat, good to choice family, at $5.25@6.75; round hoop Ohio at $5.10@5.50, and trade brands of do. at $5.60@7.00, the latter for choice; St. Louis, $5.50@6.35 for poor to fair extra and $6.35@7.25 for good to fancy. (with a few brands of very fancy quality quoted up to $7.50@8.00); Minnesota clear, $5.00@6.15; Minnesota "straight," common to fancy, at $5.75@6.35, and patent poor to very choice, $6.35@8.50, with a few fancy at $8.75@9.00; unsound stock at $2.35@5.75; city mill extra at $5.00@6.40 for fair to very choice for West Indies; do. for England $4.95@5.10; do. trade and family extras, $6.50@7.50; do. South America, $6.50@7.50 for fair to fancy; No. 2 at $2.75@4.

Buckwheat Flour—Quoted at $2@2.60. Corn meal is selling at $2.90 for Western yellow and $3.15 for Brandywine.

FRESH FRUITS.—Apples are quiet but firm. Russets are now put out for general use. A few good rod remain, but they are tender after the soft season they have gone through. Baldwins and extra Greenings, $5@5.50; "Seeks" and Spitzenbergh, $6@7 50; Russets, $4.50@5.; rough and rejections, $2.50@3.00. Cranberries have advanced; fancy bls., $9.00; good, $7.50; do. crate, choice, $3; good, $2.12@2.12; fair, $1.50@2.25. Florida oranges, $3.50@5.50—choice Indian River exceed the extreme. Peanuts rather more active; spring revives the demand; prices as yet no better. Best hand-picked Virginia, $1.30@1.40; good to fancy, 85c.@$1.20. Hickory nuts not wanted even at 75c.@$1. Pecans, Texas, 8@10c. per pound.

FURS AND SKINS.—The nominal recent rates are tamely quoted. No demand outside of hatters' stock.

GRAIN.—The markets have been sharply affected by the news from abroad, and the most active business is towards the close with prices of wheat especially higher.

Latest sales are of No. 2 red at $1 26@— ungraded red and amber State, $1 38@—; white, $1 15; No 1 Northwest spring, $1 31; No. 3 Chicago, $1 20½; No. 2 red for January at $1 28¾; No. 2 Milwaukee spring, $1 30. Rye is a trifle steadier; sales of Western at 71@72c.; State at 73@7 c. Barley, 86c for No. 1 Canada; 86@88c. for six-rowed State. Corn is weak and quiet. Latest sales are of New York No. 2 at 59½@60c.; steamer mixed, February, 52½@53c. Oats of New York extra white, at 36½@38½c.; do. No. 1, Febuary, 35½c.; No. 2 white 35½c.; mixed Western, 35½@36c.; white Western, 35@38c.

HAY AND STRAW.—Prime hay is plenty and dull, but shipping stock has a fair sale, and brings very regular prices.

Bale hay, 65@70c. for shipping, and 70@85c. for retail qualities; clover, 40@50c. for prime. Straw, 50@55c. for long rye; 50@55c. for short rye, and 40@45c. for oat.

HIGHWINES are higher—$1.08½@1.09 regular.

HONEY.—The season for comb may be deemed over, especially as new maple sirup is at hand, and there is not trade enough to make quotations.

HOPS.—Exports for the week have been 4,500 bales. This large movement not only absorbs receipts, but draws upon the accumulation and prices are strong, and on the medium and low qualities a trifle better.

State choice to fancy, 11@13c.; good to prime, 8@10c.; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Californians, 12@14c.

LEATHER.—Hemlock sole, 20@21½c. for light, 20@22c. for middle, 20@22c., for heavy, 18@19c. for good damaged.

MAPLE SUGAR.—Vermont and Ohio both send good-looking stock, but as we have remarked, buyers do not take hold freely until new crop is in large stock. Quoted at 14@16c.

OIL-CAKE.—Western is quoted at $30 ₮ ton and $29 bid.

POULTRY AND GAME.—Live poultry is in free supply but buyers will not operate largely in it as fair receipts of dressed over-stock or at least fill the market.

Fancy Phila. and N. J. turkeys, 9@10c.; good, 8@9c.; large or Toms, 7@9c.; chickens, choice, 8@9c; good, 11@13c.; common, 6@7c.; ducks, choice, 10@—c.; other, 13@14c.; geese, fancy, 11c.; other, 7@9c. Capons large 18@20c. small and slips, 15@16c.

Dressed poultry is winding up its remarkably unprofitable season at easy figures. There is no regular call for Western even at the cheap figures. One or two market days towards the close of the week start a demand, but buyers whose trade requires daily supplies can obtain about all the want from Philadelphia and other near points.

N. J. chickens, 13@14c.; Fowls, 8@9c.; Turkeys, @10c.; Toms, 6@8c.; Ducks, N. J., pair, 87@$1.12; Geese, N. J., $1.75@2.00; Western, $1.00@1.37.

Game is reduced to few kinds. For the first time in several years there was no surplus of fancy birds left to be disposed of covertly. Pigeons and wild ducks in good demand with the other items dropped from the list.

Hares and rabbits, pair, 20@25c. Canvas-back ducks, $2.12@2.25; Red-heads, $1.50; Mallard, 60@75c.; Teal, 50@50c.; Quail, prime, $2.75@3.00; soft, $2.25@2.50. Partridges, pair, 75c.@$85c. Grouse, $1.00@1.50; poor, 90c.@$1.10.

PROVISIONS have been declining on large stocks. Mess pork, $10.90@11. for spot lots; $10.80@11.00 for March and April. Bacon at 5 7-16c. for long clear and 5¾c. for short clear. Lard—Western steam at 7-55c. for spot, 7-52½c. for March, 7-62½c. for April. Tallow at 7 9-16c. for prime. Stearine, 8c. for prime Western. Beef hams at $16.50. Beef—New extra mess, $12.00@12.50; plain, $11.00@11.50; new packs, $14.75; family mess, $17.50; extra India mess, $28 for city brands; do. Philadelphia, $26.00.

SALT.—Ashton's at $2.50; Higgins', $2.40 and other sack lots at $1.10@1.15; Liverpool ground, 60@65c.

SEED.—Clover, 7¼@7¾c. for Western; 7¾@7¾c. for State. Timothy, $1.25@1.40. Rough flax, $1.55.

SUGAR.—Refined at 10½c. for cut-loaf; crushed, 10c.; powdered, 9¾c.; granulated, 9¾c.; soft white, 8½@9c.; soft yellow, 7¾@8¾c.

TOBACCO.—Export demand has been very fair and home demand increasing, as expected after the interruption occasioned by the strike.

KENTUCKY LEAF.

	Light.	Heavy.
Common lugs	3 @ 3½	3 @ 3½
Good lugs	3¾@ 4	4 @ 4½
Low leaf	5 @ 5½	5 @ 6½
Medium leaf	6 @ 7	7 @ 7½
Good leaf	7½@8¾	9 @10
Fine leaf	10½@12	11 @12¾
Selections	—@—	13 @15

VEGETABLES.—Potatoes are in good demand for home use and seed purposes. Grocers expect an improved demand when Lent sets in, and are consequently replenishing. The shipping demand for Southern use is for prime red. Bermuda stuff, $4@4.50 for potatoes, 85c. ₮ box for tomatoes—5-quarts. Beets, $2 ₮ crate. Florida peas come in bad order.

We quote Peach Blows $1.75@1.87, bulk and double-heads. Early Rose, $1.75@1.87; Peerless, $1.25@1.50; Nova Scotia, $1.90@2.00; Sweet, $2.25@2.50. Cabbages, 100, $3.00@4.00; red, 5@6. Marrow squash, bbl., $1.50@2; Hubbard do., $2.10@2.20. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 62@75c. Red and yellow onions, $1.25@1.50; white, $1.25@1.75. Celery, doz., 75c.@$1. Hot-house mushrooms, ₮ lb., 20@40c. Radishes, 100 bunches, $1@1.50. Lettuce, small, dozen, 75c.; large, $1.50@$2. Cucumbers, doz., $1@3. Rhubarb, doz., $1. Spinach, Southern, $1.75@2.25 ₮ bbl.

WOOL.—There continues a sluggish condition of trade, manufacturers buying sparingly, and absence of speculative demand. Prices are rather weak on other than medium stock, but quoted essentially as last week.

LIVE STOCK MARKETS.

NEW YORK, March 4, 1878.

BEEVES.—Receipts for the week, 8,948 head: do., last week, 10,001 do. The supply, though smaller than last week, was ample for trade. There is always more or less curtailment in butcher's supplies as Lent nears. Nothing was left over, but as a rule, prices were a trifle easier than for last week. The quality of the stock shows no general improvement, and the report to the effect that a large crop of common or medium grades is to be worked off this season, seems to be given with considerable authority, when looking at the style of bullocks that have filled the market most of the time. A few exceptional fine steers brought 10c. at the latest sales, and the range for other stock was 8@10c. Considerable stock was taken for slaughter for export.

COWS AND CALVES.—Light arrivals more than fill the demand. The nominal quotations are $45@70 ₮ head for good to choice, with very common as low as $35@30.

VEAL CALVES.—There is a moderate demand for live at 5@8c., the latter for near points; coarse heavy calves, 4@5c. Hog-dressed calves at Washington Market, fair to prime, 9@10½c.

SHEEP AND LAMBS.—Receipts for the week, 19,725 head; do., last week, 19,013 do. Receipts continue light, but seem fully equal to the demand, the market, as a whole, seeming weak. Quotations for sheep, 4½@6½c. ₮ lb.

SWINE.—Receipts for the week, 32,442 head; do. last week, 31,408. Country-dressed pork—State and New Jersey, 5@6c.; Western dressed, 4¾@8¾c.; city, 5¾@5¾c.

Reading for the Young.

WHAT THREE LITTLE KITTENS DID.

THREE little kittens, so downy and soft,
  Were cuddled up by the fire,
And two little children were sleeping aloft,
  As cosy as heart could desire;
Dreaming of something ever so nice,
Dolls and sugar plums! rats and mice!

The night wore on, and the mistress said,
  "I'm sleepy, I must confess,
And as kitties and babies are safe in bed,
  I'll go to bed, too, I guess."
So she went up stairs just a story higher,
While the kittens slept by the kitchen-fire.

"What noise can that be?" the mistress said;
  "*Me-ow! me-ow!*" "I'm afraid
A poor kitty-cat's fallen out of bed!
  The nice little nest I made!"
"*Me-ow! me-ow!*" "Dear me! dear me!"
  I wonder what can the matter be!"

The mistress paused on an upper stair,
  For what did she see below,
But three little kittens with frightened air,
  Standing up in a row!
With six little paws on the step above,
And no mother cat to caress or love!

Through the kitchen door came a cloud of smoke!
  The mistress, in great alarm,
To a sense of danger straightway awoke;
  Her babies might come to harm!
On the kitchen hearth to her great amaze,
Was the basket of shavings beginning to blaze!

The three little kittens were hugged and kissed,
  And promised many a mouse:
While their names were put upon honor's list
  For hadn't they saved a house?
And two little children were gathered tight
To their mother's heart ere they slept that night.

Youth's Companion.

LETTERS FROM BOYS AND GIRLS.

How It Is Done.

DEAR UNCLE TRUE:—One of the mountain cousins calls on Lily La, for information, about the decorations of her Christmas tree; I expect that means myself, although she did not get the name quite right. I am Lee, instead of La, but that is no matter.

Have the corn all popped nicely; and by the way, did the cousins ever notice how much better corn pops on a shining cold day, with the wind blowing a hurricane, than it does in a mild warm day? Make some candy, either of maple or granulated sugar; the white sugar looks nicest, but the maple tastes the best, so I generally use it. The way I make it is, to two pounds of sugar, pour in one small teacup of good vinegar, and let it boil till a drop from the spoon will sink in a little ball to the bottom of a cup of cold water. I cut out crosses and anchors and wings from white pasteboard, and spread the candy all over the surface of one side, then stick the corn in. You have to work lively, or the candy will get cold, and it will stick then; but you can keep it over. I make corn balls in the same way, only do not have any paste-board; but put a little flour on my hands, and squeeze the corn and candy together in a round ball. They are just as nice as can be. For festoons, we string the corn with a fine needle and white thread, and they look lovely among the dark green branches, as well as the other ornaments, and one does like to see pretty things on one's Christmas tree.

I wonder if all the cousins know how to make nice candy? I think it is fun to make it, but better sport to eat it; and then, we do not get any thing in it that is hurtful or poisonous. If they would like, I will get the receipts that grandmother had from a Southern lady for making molasses candy, sugar and cream candy, lemon drops, and some other kinds, and it is real jolly to make them, and pull them too. Now about that glove box on brackets. I can tell you how to make the glove box, and the boys can make the brackets to set it on. In my letter to Uncle True, I said we had glove boxes, and brackets. I expect changing that little word from a conjunction, to an adverb, is what they call a typographical error, yet I think that a nice bracket to set a glove box on, would be a very fine arrangement, and I intend to propose to my brothers to make one, purposely to use in that manner. I think these brothers are the nicest institutions in the universe. What girls ever do without brothers, is a hard conundrum for me to puzzle out. They are perfect comforts over at our house; the only trouble is, they get to be young men so quickly!

LILY LEE.

Another Wild One.

DEAR COUSINS:—Here is another *wild* cousin who has read the cousins' letters with a great deal of interest and would like to join the ranks,—that is if you do not object.

I feel like saying some *dreadful* things about that "Slayerofconceit," but suppose I must not. I should judge, however, that he is one of those boys who thinks himself a little wiser than mankind in general, and women in particular. What rubbish has crept into that fellow's head! And you, "Solomon Sap," what is the use of being frightened away by little girls, for as "Sam" says, it is a trick of the girls to try to scare a fellow. The girls are not so easily scared! Now, there is "Rocky Mountain Joe"—who says he can sew with a thimble, and do housework equal to any girl, and asks "Wild Fern" what she can do in the line of out-door work. Come girls, let us all tell. I for one can milk, feed cows, pigs, chickens, horses and calves, and harness and drive a horse as well as any boy. I think that "B. B." is wrong about "whistling girls;" for its my belief that "whistling girls and hens that crow, take their comfort as they go." Write again, "Adele W.," your letters are capital, and will not "Hawaiine" please write as often as she can? Dear me, how long this letter is getting, and how mixed up, too, and if it does not find its way into UNCLE TRUE'S basket, you may hear again from

WILD CHERRY.

Wishes to Say a Word or Two.

UNCLE TRUE AND COUSINS:—I should like to put in my voice and say a word or two. To begin with I, for one, will sign "Mad-cap Molly's" pledge, and hope many more will do the same.

I have never read "Solomon Sap's" or "Slayer-of conceit's" letters, but I think from the way the Cousins write about them, that one needs the sap drawn from his head and the other the conceit from his. I should like to ask Katie and Susie if the initials of the club that the boys got up in opposition to E. E. C. were not B. Q. C. instead of B. O. C.? I should like to know how many signers "Wild Fire" has secured for his pledge. One word to "Young Canadian": I think your letter was too short if anything, but I see you got all the desired information. I wish to ask "Yankee Bill" if Josh Billings ever wrote upon the interesting subject of old Bachelors?

"Rocky Mountain Joe" wants to know what one of the Cousins ("Wild Fern") can do in the way of out-of-door work? Well, I am not "Wild Fern," but I will tell what I can do: I can catch a horse, harness and hitch him to the wagon; can take care of cows, and—but I guess I have said enough on that subject. I, for one can say that I do not drink any spirituous liquors, nor wine, nor use tobacco in any form. I hope the Cousins will have a pleasant winter, with plenty of snow and good ice. BROWN BADGER.

Wis.

An Earthly Paradise.

DEAR UNCLE TRUE AND COUSINS—I am not so young but that I have been younger, and not so old but that I expect to be older. Liking to talk, and thinking you would be glad to hear me when you know what I have to say, I write to tell you that we have a delightful country. In our reading books we are accustomed to find sketches from tourists among the Pyrenees, the Appenines and the Alps, describing the scenery as delightful, entrancing, but I doubt much whether the world anywhere presents finer, grander, or more delightful scenes for the pencil of the painter or the pen of the writer than can be found among our hills and valleys, and you may be glad to know that at this season of the year you may find here game in profusion, and in summer, if familiar with hook and line, you may fill your basket with as fine speckled trout as swim, and in hunting or fishing you will breathe as pure air and drink as clear spring water as can be found on this earth. If you don't believe it or do, come and see. Y.

Emporium, Pa.

A Visit to the Indians.

DEAR COUSINS;—The Indians of the Cattaraugus Reservation, which is not far from here, have been holding a council and dance the past two weeks. Our teacher and twenty of the boys and girls went in a sleigh to see them. They were not dancing that afternoon, but we had a splendid time. I wish Uncle True and all the Cousins could have been with us. They were playing a game which we did not understand, but they laughed and talked and seemed to have a great deal of fun over it. Some of us boys were not satisfied, and went the next day. We saw them dance the war and several other dances. I have not heard from "Jumping Jack" since he escorted the two young ladies out. I am afraid they were too much for him. When I write again I will tell about our school. SAM.

Collins, N. Y.

Miss Lottie Returns Thanks.

DEAR EDITOR:—I had thought of not sending another letter to the RURAL, as no *little* girls seem to be writing; but last week, while reading the letters, I was delighted to see my name mentioned by a young lady from Toledo, O., and I thought I should certainly write and thank her for remembering me so long. When I wrote my first letter to the RURAL, I was not quite eight years old; now I am nine, and am going to school. I have six studies besides Writing, and after my lessons I have lots of fun. Would like to tell you all about our games and amusements, but I cannot write a very long letter. Again I thank Miss E. K. for thinking of me, and hope to hear from her soon. You little friend, LOTTIE KING.

Accepted.

DEAR RURAL COUSINS—I am anxious to become one of the "Cousins." Will you accept me as such? I live on a farm and enjoy country life very much.

I am a girl and sixteen years of age. I have been to boarding school for a year and a-half. We have just begun to take the RURAL. We have never taken a paper in which the boys and girls take such an active part as in the RURAL. Encouraged by these letters I have tried to write to you. If I am accepted, perhaps you will hear from me again. GINA H.

Lewisburg, Pa.

Yearns for Excitement.

DEAR COUSINS:—I have just been reading Carrie B. H.'s letter, wishing for something exciting, and I quite agree with her. But cannot she commence it by telling the rest of the Cousins (who had to stay at home) about her trip! I think it would be quite interesting. Will M. B. P. tell about her fancy work—that is, some of it? Ed. E. K. told ago and night, but did not say anything about books. I suppose he did not think them of any account. I would like to hear about Toledo. NELL S.

Mercer Co., Pa.

The Usual Kind.

DEAR UNCLE TRUE AND COUSINS—If you will allow me to claim relationship. I have been a reader or the RURAL for some time, and I like it very much. I am always anxious to read the Boys' and Girls' Letters.

I think "Slayerofconceit" has a pretty hard row to hoe; but I imagine he has conceit enough to come out winner. I should have tried to write you ere this, but for the thoughts of that terrible waste-basket. If this should find its way to the Letter Column, I shall try to write you again.

EDWIN.

From Rhode Island.

DEAR RURAL COUSINS—I want to claim relationship. I like your letters about as well as my father does the letters about cows and fruit. I hope they will teach him to raise some good pears and grapes, because I like them: don't you? I have a little flower garden, I call my own, but my father does the work and I pick the flowers. He says he will get me some new seeds from the RURAL next year. LIZZIE S. WATSON.

A Murphy, but No Ribbon.

DEAR RURAL COUSINS:—As the Editor was so kind as to print my first letter, I thought I would try again. We had a Christmas tree in the church and we had a very fine time. I think that perhaps "Yankee Bill" is trying to surpass "Josh Billings." I belong to the "Murphies," but here they do not give blue ribbons. Until you hear from me again, I remain, WILLIE W. R.

"All O. K."

DEAR RURAL COUSINS:—I have been watching with much interest your letters back and forth, and have enjoyed them very much. I would like to join you. I am very much pleased with two or three Cousins, and would like to hear oftener from them. So, with your kind permission, I would join you with this, my introduction, and remain yours, hereafter, "O. K."

Expresses Satisfaction.

DEAR RURAL COUSINS: I have been reading the letters from the Boys and Girls with considerable interest. This is my first attempt at expressing my satisfaction and I think I will stop right here.

X.

The Puzzler.

GEOGRAPHICAL ENIGMA.

I AM composed of 24 letters:
My 3, 7, 6, 12, 10, 6 a city of Europe.
My 18, 10, 24, 15, 6, 17, 22, 5 a city in the United States.
My 23, 10, 1, 6 are mountains in the United States.
My 7, 14, 19, 10 one of the United States.
My 1, 15, 11, 15, 6 12 an island in Europe.
My 10, 6, 20, 15, 23, 19 7 a North American lake.
My 21, 22, 6, 6, 22, 24, 24, 22 a river in the United States.
My 13, 7, 23, 23, 22, 6, 24 a lake.
My 8, 7, 6, 19, 6, 4 a gulf near the Pacific Ocean.
My 16, 7, 11, 4, 1 a city in Madagascar.
My whole is an old saying.
☞ Answer in two weeks. ALICE.

HIDDEN BUILDINGS.

1. DID you shove Leonard's chair?
2. I advise you to shun evil, lads.
3. John shot larks for sport.
4. You are a staver, Norman.
5. It is a fact, or Youngs would not have told me.
6. Does Mat owe Robert yet?
7. Where is that heater, mother?
8. Give me a stem, please.
9. Don't you think Amos queer sometimes?
10. Died: Henry Scott, aged 90 years.

☞ Answer in two weeks. S. C.

DOUBLE CROSS-WORD ENIGMA.

My first is in cranberry but not in berry,
My second is in pumpkin but not in cherry;
My third is in whortleberry but not in peach,
My fourth is in persimmon but not in leech;
My fifth is in crab apple but not in blueberry,
My sixth is in watermelon but not in mulberry;
My seventh is in tomato but not in soup,
My whole are two kinds of fruit.
☞ Answer in two weeks. DR.

CROSS-WORD ENIGMA.

My first is in jay but not in martin,
My second is in lark but not in robin;
My third is in ostrich but not in sparrow,
My fourth is in woodpecker but not in swallow;
My fifth is in condor but not in mavis,
My sixth is in lapwing but not in ibis;
My seventh is in pewit but not in bunting,
My whole (a bird) you'll find by hunting.
☞ Answer in two weeks. FLORIDAN.

AT REST.

"The eternal God is thy refuge, and underneath are the everlasting arms."

It is the evening hour,
  And thankfully,
Father, Thy weary child
  Has come to Thee.

I lean my aching head
  Upon Thy breast,
And there, and only there,
  I am at rest.

Thou knowest all my life;
  Each petty sin;
Nothing is hid from Thee,
  Without, within.

All that I have or am
  Is wholly Thine;
So is my soul at peace,
  For thou art mine.

To-morrow's dawn may find
  Me here or there—
It matters little since Thy love
  Is everywhere.

N. Y. Observer.

WORDS.

"For by thy words thou shalt be justified, and by thy words shalt thou be condemned."—*Matt.* xii. 37.

HAVE you ever thought how important your *words* are—that every word you speak on earth will be remembered either to justify or to condemn you at the great day of judgment? We are all apt to speak the thoughts of our hearts, whether they be good or bad, and we soon forget that which we have said; how differently we should speak if we were always to remember that every word is noted down in the book of God's remembrance! Solomon, the wise king, knew the great importance of words, and in almost every chapter of the Book of Proverbs he speaks of the evil wrought by them, and the necessity for guarding our lips. St. James, too, speaking of the tongue, says it is "a world of iniquity."

Does it cost you more to speak kindly than it does to speak unkindly? How often does your brother or sister come to ask you something, and is driven back with the cross word that brings the tears to their eyes, when a smile and a kind word would have smoothed away the difficulty and made them happy. How much happier we should all be if we always spoke kindly and considerately to one another; instead of this, we are too ready to find fault with each other, to speak of each other's shortcomings, forgetful of the words, "Speak evil of no man," and so cause more unhappiness than I can tell you; and many a sorrowful heart has been made more sorrowful, many a hard trial harder to bear, by unkind words. Try to speak kindly now that you are young, and thus you may help others, as well as do good. Remember it has been said, "Speak of the faults of others only in prayer;" and "for every fault we find in others, find ten in ourselves."

We very often speak of the troubles that come to us, but we more often forget to mention the blessings we enjoy; and yet if anybody would fairly count both troubles and blessings, he would find the last to be far the greater number. Those persons who are always grumbling, finding fault with others and themselves, are not pleasing to God; their words will condemn, not justify them; but those who speak much of God's mercies, and who accept His dealings with them in a right spirit, who seek to cast sunshine on all they do by the bright words they say, shall have their reward.

Praying Christians are always holy Christians. We often speak of the friends we love; ought we not often to speak of God? Let us do so in prayer, and the words will be blessed to us; for they always bring a blessing from above.

If we have anything we value very much on earth, we like to tell other people about it, and often talk about it; and so, if we know anything of how sweet it is to love Jesus, we shall be very anxious to tell our companions and friends.

These are some of the words we ought to speak; are such words as these often on your lips? Or do you speak unkind, selfish, quarrelsome, and idle words? Remember, that all such will bring you into condemnation.

There are two very solemn reasons why we should be careful about what we say; one is, that God hears every word and, as I told you before, notes it down in His book, so that nothing is lost. We may speak unkindly to others, and they may forgive our words, and possibly forget them; but God remembers them. We may speak unkindly of others, and they may not hear what we say, may know nothing of it; but there is One above who does know, and He will judge us for it. We may say things that are not true now, and no one on this earth may discover our sin; but "lying lips are abomination to the Lord," and assuredly the Lord will punish their possessors. Let us remember, then, that God hears our words, and let us strive that He shall hear none but words of love; for these too are written down in His book, and those who have such words written against their names, God promises shall be numbered amongst his jewels.

The other reason is, because our lives are so uncertain that each word we speak may be our last. If we know that before to-morrow came we should be speechless, should we not be very careful what we said to-day? We do not know this, but we do know that it may be so. CARRIE H.

PERSONAL ITEMS.

Eighteen million dollars in judgments are down to Tweed's account in the courts, and the proceedings to declare him a bankrupt have failed.

King Humbert is reported to be seriously indisposed. He has been subject to blood-spitting for a long time, and recent fatigue and excitement have aggravated his complaint.

Mr. Wm. B. Astor has just bought for $10,000 General Phillip's, a horse which has won many races in the Gulf States, and which, the Galveston News predicts, will be at four years old the fastest horse of his age in the country.

Three weeks ago the aggregate sum which John T. Raymond, the actor, had paid Samuel L. Clemens, better known as "Mark Twain," for the right to apply the name of "Colonel Sellers" to one of the cleverest of original creations, was $100,000. The play, "The Gilded Age," has therefore proved a bonanza to Mark.

Pecci, now Pope Leo XIII., is tall, with a fine head, high forehead narrowing at the temples, a long face, and straight features. He has a large mouth, prominent chin, cheerful, open countenance, and large, well-shaped ears. He has a fine sonorous voice, great dignity, even austerity of manners in public life, but privately is affectionate, unassuming, sociable, and witty.

New Publications.

TO ADVERTISERS! We will send free to all applicants who do any newspaper advertising, the THIRD EDITION of
AYER & SON'S MANUAL FOR ADVERTISERS. 184 8vo. pp. More complete than any which have preceded it. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists have been carefully revised, and where practicable prices have been reduced. The special offers are numerous and unusually advantageous. Be sure to send for it before spending any money in newspaper advertising. Address N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

THE PEOPLE'S TRIBUNE, established 1864, published at Jefferson City, Mo., should be in the hands of every lawyer in the land. Publishes in each issue (weekly) decisions of the Supreme Court of Missouri. Lawyers are thus enabled to read opinions months in advance of the Reports, at comparatively little cost. Only $1 50 per year. The TRIBUNE is newsy, reliable, and an excellent family paper. Address REGAN & CARTER,
Jefferson City, Mo.

SPARKS AND SPLINTERS.

It's observable that one-armed men always shake with the left hand.—*Com'l Adv.*

Precocious boy (munching the fruit of the date tree:) "Mamma, if I eat dates enough will I grow up to be an almanac?"

Our ancestors the monkeys couldn't have been so ignorant after all, Mr. Darwin. They were all educated in the higher branches.

"Boiling hair in a solution of tea will darken it," says an exchange; but some people don't like to have their tea darkened in that way.

Sunday-school teacher: "Who was the strongest man?" Boy: "Jonah: because the whale couldn't hold him after he got him down."

Senior is questioned: "What is the name of the lady to whom you are engaged?" Senior blandly responds: "Which one?"—*Oberlin Review.*

That Terrible Scourge,

Fever and ague, and its congener, bilious remittent, besides affections of the stomach, liver and bowels, produced by miasmatic air and water, are both eradicated and prevented by the use of Hostetter's Stomach Bitters, a purely vegetable elixir, indorsed by physicians, and more extensively used as a remedy for the above class of disorders, as well as for many others, than any medicine of the age. A languid circulation, a torpid state of the liver, a want of vital stamina, are conditions peculiarly favorable to malarial diseases. They are, however, surely remedied by the great Preventive, which, by invigorating the system and endowing it with regularity as well as vigor, provides it with a resistant power which enables it to withstand disorders not only of a malarial type, but a host of others to which feeble and ill-regulated systems are subject. The Bitters are a safe as well as searching eradicant, and have widely superseded that dangerous drug, quinine, which palliates but does not eradicate malaria.

BLISS' SELECT GARDEN SEEDS

$250 in Premiums.

PRINGLE'S NEW HYBRID SPRING WHEATS.

CHAMPLAIN.—A bearded variety—a cross between the Black Sea and Golden Drop. Its strong and vigorous straw, growing 6 to 12 inches higher than its parent varieties, stands erect, frequently bearing heads from 5 to 6 inches in length, containing from 60 to 75 kernels each.

Price, $1 per lb.; 3 lbs., $2.50, by mail, post-paid.

DEFIANCE.—Another variety of the highest promise, which displays great productiveness, vigor and hardiness. It is a beardless, white chaff wheat, with heads frequently 5 to 6 inches long, very closely set with large white kernels, frequently numbering 75 to 80 to the single head.

Price, $1 per lb.; 3 lbs., $2.50, by mail, post-paid.

In order to induce Wheat Growers to give these new sorts a thorough trial, we offer **$250 in premiums** for the largest quantities grown from 1 lb. of seed, also for the 20 largest heads. For particulars see Circular.

Two New Varieties of Potatoes.

BLISS' TRIUMPH.—An extra early variety, ripening a week to ten days earlier than the Early Rose—and one of the most attractive in appearance. Superior quality and very productive.

TROPHY.—A new and exceedingly fine, medium early, red-skinned variety, resembling the Snowflake in appearance and quality. It might with propriety be called a Red-Skin Snowflake.

This variety was exhibited in London at the great International Potato Show, in October last, and received a first-class certificate.

Price of each, $1 per lb.; three lbs. to one address, $2.50, by mail, post-paid. See Potato Catalogue.

Bliss's Illustrated Seed Catalogue and Amateur's Guide to the Flower and Kitchen Garden. 220 pages, including several hundred finely-executed engravings, and a **beautifully-colored Lithograph. 35 cents.**

Bliss's Illustrated Handbook, for the Farm and the Garden, and abridged Catalogue of **Garden, Field and Flower Seeds, Fertilizers,** Agricultural Implements, etc., etc. One hundred pages, many illustrations, 3 cents.

Bliss's Illustrated Catalogue of Plants, for the Greenhouse, Conservatory, Lawn and Flower Garden, and

Bliss's Illustrated List of Novelties for 1878, mailed free to all. Address

B. K. BLISS & SONS,
34 Barclay Street, New York.

USE Dr. C. B. HOWE'S CONCENTRATED Syrup, for the Blood, Liver, Kidneys, &c. It will cure Catarrh, Consumption, Bronchitis and Throat Diseases; also Scrofula, Tetter, Salt Rheum, &c. Sold by druggists; or send $1 to the above address, at Seneca Falls, N. Y., and get, by return Express, one bottle free of charge. The cure is guaranteed, or no sale. Send for Circulars, terms, &c.

STOCKBRIDGE
MANURES

Originated by Prof. Stockbridge, Prof. of Agriculture in the Massachusetts Agricultural College.

Made for each crop, furnishing the plant food which each requires. They have been used for five years with such success that in 1877 they were applied on over 10,000 acres with excellent results. **Send for Pamphlet. Mailed Free.** Also for sale, Agricultural Chemicals.

Arboricultural.

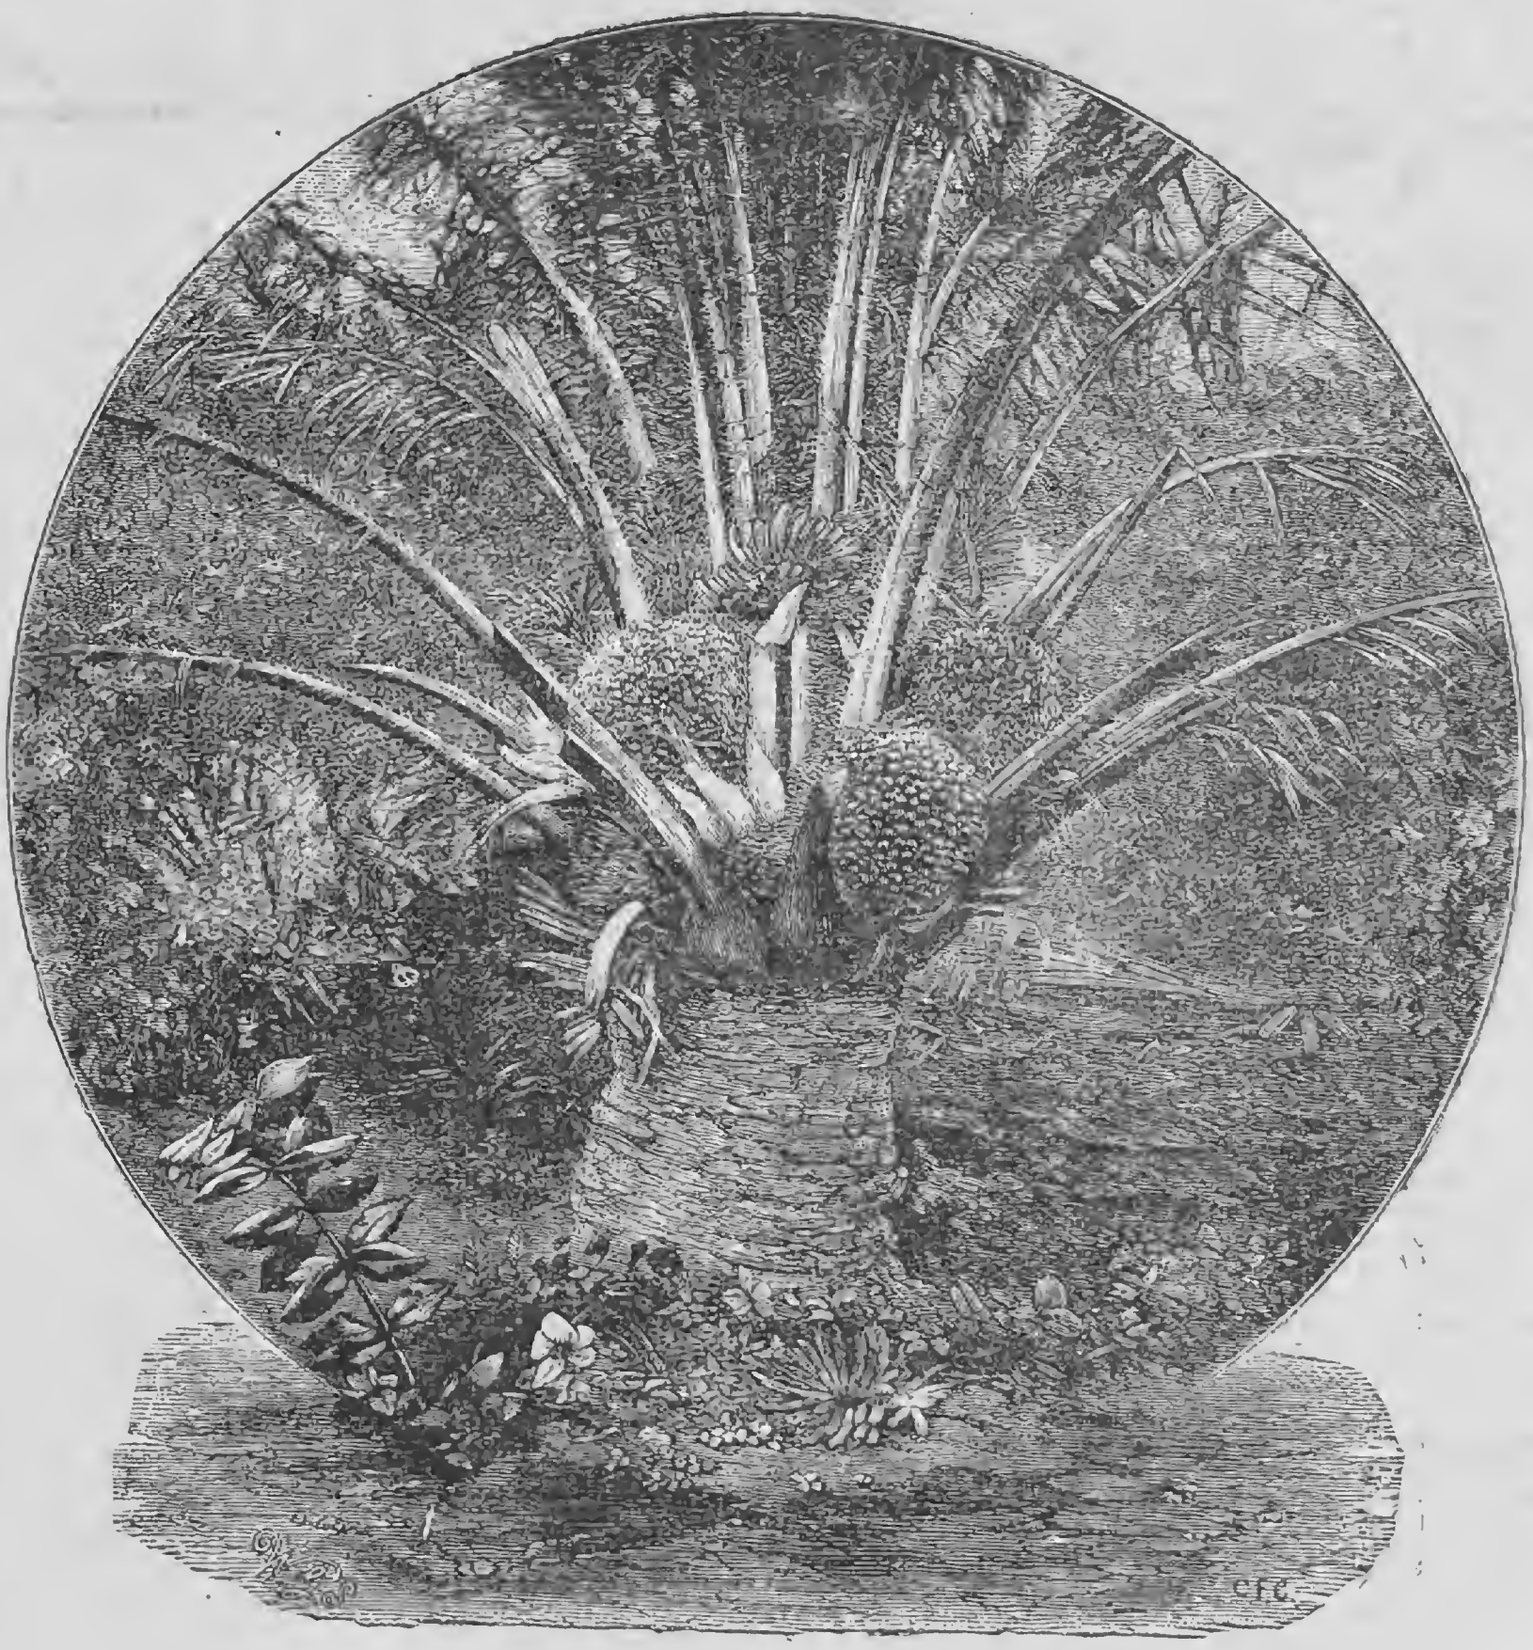
THE OIL PALM TREE AND ITS PRODUCT.

Of the multitudinous species of the Palm family, the products of a few only have found their way into American and European commerce, the most valued being those of the Cocoa-nut, the Date and the Oil Palms. Of these the appearance of the last is the least familiar to most persons as, unlike the others, it has never hitherto been accurately pictured in scientific and popular works. In Western Tropical Africa there are vast regions thickly covered with the members of this species, and it is from this torrid region, especially from the River Bonny, that the largest quantities of palm oil find their way into the American markets. The trade with the natives is carried on chiefly by barter, glass beads of various forms, sizes, and colors being among the principal articles of exchange.

The trunk of the tree from which palm oil is obtained is seldom over thirty feet high, and is surmounted with a tuft of long pinnate leaves garnished with prickly petioles. The flowers are dioecious, and borne in dense heads, sometimes two feet long and two or more feet in circumference. In these closely crowded spadices the fruit is so compactly clustered that the bunches bear a strong resemblance to large pine-apples. The individual fruits are about an inch and a half long, somewhat pear-shaped and when fully ripe of a bright orange color. They consist of an outer soft, pulpy substance from which the best oil is obtained, inside which, forming about one-fourth of the whole, is a very hard, stony shell inclosing the seeds, and yielding, when crushed, a clear, limpid product called palm-nut oil. The fruit, when sufficiently ripe, are gathered by men, boiled in large earthenware pots by women, and then crushed in mortars. They are next placed in large clay vats filled with water, and women tread out the oil which rises to the surface and is skimmed off. It is then once more boiled to get rid of the water, and packed away in barrels or casks for exportation. It still retains the coloring matter of the fruit, which is removed by subsequent processes in numerous factories in Europe, either by bleaching in shallow pans on the surface of hot water or by various chemical methods of treatment. As each drupe affords only about one-sixteenth of an ounce of pure oil and each tree only three or four pounds, an immense amount of labor is required to procure the product and a vast area of forest is annually destroyed to supply the demands of commerce.

Good palm oil is a fatty substance of the consistence of butter, of a rich orange color, a sweetish taste, and an odor like that of violets or orris root. It is now extensively used in the manufacture of candles, soap, and also as an axle grease, chiefly for the wheels of railroad cars. At a temperature of from 75° to 95° F. it melts to a very thin fluid, and the older it is, the greater the heat required to liquify it. By age and exposure it becomes rancid and assumes a whitish tinge. It is perfectly soluble in ether, slightly so in cold alcohol, but readily dissolves in hot alcohol, though on cooling it solidifies. It consists of margerine, oleine, and a solid fat like stearine, which is called palmatine, and constitutes two-thirds of its weight.

Palm oil is used more extensively for the manufacture of candles than for any other purpose and the process, though somewhat lengthy, is highly interesting. Having been melted by a jet of steam introduced into the casks, and freed from all impurities, it is mixed with from one-seventh to one-sixth of its weight of sulphuric acid and briskly agitated for about two hours in copper boilers in which steam maintains a temperature of about 350°. The sulphuric acid and the glycerine, which is an ingredient of its component fats, are in this way decomposed and escape partly in the form of carbonic and sulphurous acids, and partly by subsequent washing. The impure acids are then distilled in copper stills steam-heated to a temperature of 600°. The dark residue in the boilers is made to yield still more oil by heavy pressure and the black refuse that remains is used for fuel. When cooled, the distilled fat is broken into cakes eighteen inches long and at about an inch and three-quarters thick. These are spread upon squares of cocoa-nut matting and are then piled on top of each other and submitted to hydraulic pressure at a temperature of 75°. The fat obtained may be run at once into candles for the European and American markets, but for tropical use, it is again submitted to pressure at a temperature of 120°. The engraving is from a



THE OIL PALM TREE.

photograph presented to the Kew Museum, published in the London Gardener's Chronicle and deemed worthy of reproduction here reproduced as above.

Farm Topics.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

ORNAMENTING THE HOMESTEAD.

I HAVE often wondered at the lack of interest displayed by farmers in the matter of adorning and beautifying the home and farm. Men of no other occupation have the resources that they possess. Every wooded slope, every swamp, every piece of timber land furnishes ample material for the decoration of the lawn, the garden, and the roadside. The Sugar and Black Maple, the White Ash and the Linden, are easily attainable by nearly all rural readers for roadside planting, and those who think they cannot afford to purchase Spruce, Fir, or rarer specimens for the lawn, or as a protection to outbuildiugs from the rigorous blasts of our northern latitude, can easily and cheaply procure an excellent substitute among the smaller specimens of Hemlock, Balsam, or even Pine. Nothing, to my mind, impresses a more desolate aspect than the farm-house upon the hillside, destitute of any artificial protection save the skeleton trunks and branches of a few stunted and ill-favored apple or cherry trees. A heavy belt of evergreens on the north and west side of all the buildings where practicable, a clump or a single tree here and there upon the lawn, arranged and grouped in accordance with nature, not set after any prescribed rule, would relieve the monotony of the view amazingly, and afford an immense amount of protection from the searching winds of winter.

And the road-sides? They too should be the object of our attention. True, the law prescribes a remedy for the lack of shade trees within the bounds of the highway in this State, in that twenty-five cents shall be deducted from the road tax of every landholder for every tree he shall plant and protect until growing nicely. I, however, would not wait for this, or be influenced on this account, in a matter which is of as much interest and satisfaction to myself as to other people. Ten chances to one, the highway requires *all* the tax and perhaps an appropriation from the Commissioner besides, in order to make it passable. For small hedges about the lawn, I consider planting seed the surest and easiest mode, digging trenches where the hedge is desired, and filling them with soil from the woods. I would plant in the fall, as soon as the seeds mature. Some people claim the proper time for setting Balsams to be in June; yet that has not been my experience. Whenever I planted this species at that time, I have always lost more than I saved. Some people will claim they have no time for such "fol-de-rol;" that the more important features of the farm demand their exclusive attention. Farmers make a great mistake here. It will be money in their pockets when they sell or desire to sell their farms—should such an event ever occur—and if not, then it will amply repay them by the genuine, heartfelt enjoyment they will thereafter derive from the change. And as for time, let them rise a little earlier mornings, spend less time at the blacksmith shop and in talking to passers-by, and they will find ample time both to transplant evergreen and deciduous trees, and to assist the good-wife in beautifying the garden and house. I have found it profitable and more safe to select small trees for planting than large ones. They branch lower down, and in taking them up there are not so many roots to be removed. The idea that one will have large trees sooner by selecting large ones, is erroneous. The small ones grow much faster, and make better-shaped trees. Balsams and Hemlocks grow thin tops in the forest, but transplanted to open ground, become thick and compact.

MAPLE-SUGAR MAKING.

The season of making maple-sirup and sugar is at hand, and a delicacy so easily obtained by the majority of farmers, should be found in many more houses than it is. I claim to be something of an epicure myself, and I defy any one to produce an article that will entirely fill the place of light buckwheat cakes, sweet yellow butter, and delicious maple sirup. It is unnecessary for me to say much in regard to the manner of securing the sap and extracting the sweetness therefrom, for S. J. B., in the RURAL of February 16, has given us a detailed and comprehensive account of the means employed. I differ from him in one particular, however—that is in regard to the manner of tapping the tree. Formerly I considered an auger best, but shall hereafter use an ax, cutting a small notch; two blows are amply sufficient. I shall use the spiles recommended by him; but only slightly bent and driven into the tree underneath the notch. They should be ground sharp on one side before bending. It is unnecessary to girdle trees, as some do: the two blows of the ax, if rightly applied, will induce as great a flow as though a large chip were removed. Trees properly treated will retain their vitality for many years; and although there will not be as great a flow of sap, it will be much sweeter than at the first season's tapping. Let all RURAL readers who are fortunate enough to possess sugar maple trees, make a little sirup, at least; and this spring enjoy a few meals that a king might envy.

REMEDY FOR SCURF ON PIGS.

Some time since I purchased a three-months-old pig that had become covered with a thick, black scurf, caused probably by sweating, for there were several in the pen together; or perchance it might have been from eating buckwheat, with which it had been fed occasionally. During the warm days, I have poured buttermilk over its back, and the scurf is all removed and the pig doing finely. The remedy is simple; yet I have never known it to fail, even when the disease was of so long duration that the animal's back was raw with sores.

TOO MANY FENCES.

I have often wondered at the preference of farmers for small fields. One often sees two, three, or five acres inclosed by an old, zigzag rail-fence, and the whole farm, in many instances, cut up into small sections; whereas, one-third the amount of fencing would be just as satisfactory and much more pleasing to the eye. Cultivated as it usually is, nearly a rod in width of the land is left for the propagation of briars, weeds, and thistles. From what experience I have had, I arrived at the conclusion, some time since, that the old-style, seven-rail staked and ridered fence was the most expensive that could be built. Post-and-rail fences or board, are much neater, require less room, and are not nearly so liable to get out of repair. And in regard to small fields; we all, of course, need *some;* yet that does not compel us to divide all our land in the same manner. Seventy acres of ground calculated for a grain crop, all inclosed in one field, is worth nearly double—one-third more at least—than the same area divided into four small fields: that is, considering the difference in time required to cultivate each, and the waste land taken up by the unnecessary fences. Large fields are more handy to till, are a saving of both land and fencing materials, look much better, while it requires less time to keep the fences in good condition. This last consideration I am sorry to say, is even by many otherwise good farmers, seriously neglected.

FARMERS' INSTITUTES IN MICHIGAN.

PROFESSOR W. J. BEAL.

THE last of these for this winter, has just been held at Climax, in Kalamazoo County. This is the third winter that a series of six Institutes has been held by the Agricultural College in various portions of Michigan. From the first, they have increased in interest and in attendance. Besides those held by the College, others of a similar nature are to be held in various portions of the State. At present we know of five such Institutes in preparation. Some of the most interesting topics presented by Professors of the College were:—Cost and Price of Farm Products, Rotation of Crops, Relative Value of Different Varieties of Michigan Wheats, Experments in Testing Seeds, Economy of Farm Management, Hessian Fly, Practical Education, Use of Steam in Agriculture, Veterinary Science for Farmers, The Agricultural College, Tile Draining, Starting an Apple Orchard, Healthy Homes for Farmers. Many valuable papers were presented by farmers and their wives.

The Institutes were well attended, and consisted mostly of farmers and their families. At each session there were usually present from 200 to 600 persons. In some cases delegates came fifteen, twenty, or thirty miles, and in one case a man rode a day and a half in a stage-coach to get to the railway which took him to the Institute.

The programmes were all good, and called out profitable discussions. In some cases the agricultural bore was present with his long speech or his paper filled with common-place sayings. However, the bores were so well managed that they rather proved a source of amusement than annoyance.

Farmers seem well pleased with their occupation. Certainly, any other business carried on as many farms are carried on, would lead to loss and failure. Judging from the Agricultural Fairs, the meetings of the Grange and Institutes, the farmers of Michigan are waking up and making rapid progress in every department of agriculture. They have not yet arrived at perfection. We hardly dare venture to give the meager number of agricultural papers taken by the farmers, even in the best portions of the State. A reliable person of much intelligence said that in his neighborhood, in the garden of Michigan, not over one farmer in twenty took an agricultural paper, and not one-half took any paper which pretended to contain any agricultural information. If this be true, the farmers' millennium is still a long way in the future; for no farmer can keep up in these times without one or several papers devoted to his business.

I could quote several pages from the State and local papers, stating in the most enthusiastic terms the delight of their editors in attending the Institute.

CARBOLIC ACID IN CASTRATION.

PROBABLY most readers of the RURAL, who raise stock, have been troubled by animals getting fly-blown subsequent to castration. Such will be glad to hear of any effective preventive or remedy. Dilute carbolic acid with thirty times its weight of water, and apply well to the wounded part after the operation.

Last year I cut a boar in warm weather, and, as the parts appeared unduly swollen, I examined the wound and found it badly affected with maggots. It struck me that carbolic acid would most effectually destroy them and restore healthy action. I thoroughly syringed the wounds with the diluted acid and it afforded immediate relief, followed by speedy closing of the wounds. I now constantly use it after castration, and find it most beneficial, preventing putrefaction and undue formation of pus.

Monterey, Cal. EDWARD BERWICK.

Horticultural.

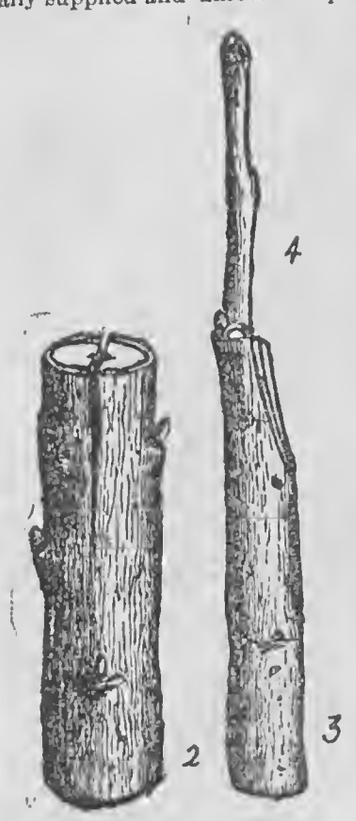
NOTES FROM THE RURAL GROUNDS.

Northern Spring-time.

AGAIN we have spring. One year of life gone another spring-time arrived. Have we a sharper appetite and a keener relish for the green things that are soon to spring up about us, for the floral beauties that soon will follow? This is one of the pleasures that those who live in lands of perpetual verdure never know. The long night of rest to plants has nearly ended. They have had their repose and as if thoroughly refreshed—as if indeed wearied with rest—they are ready to awake again to work and growth.

EARLY WORK.

The first work of the enterprising horticulturist is to select from all plants accessible to him, those most useful, most beautiful, the best adapted to the situation, soil and climate in which they are to grow. This done, he is to provide all necessary care and culture for their future well-being. It is time that the preliminary steps were now taken. All needed information as to hot-beds and cold-frames may be found in any catalogue. We may now say a word as to the preparation of the borders where the young plants are to be placed and to remain during the season. Unless the soil is rich, either naturally so or from previous manuring, manure must be liberally supplied and unless composts have



been previously prepared, perhaps old stable manure is best for general purposes. Spread this at the rate of a barrowful to every fifty square feet, and as soon as the earth will crumble in the hand, spade it under. But let this be done carefully, thoroughly digging close to the margins so as to insure that the edging plants shall have a due share. At the same time the sods forming the grass borders should be cut sharply, thus preserving a distinct, perfect outline. If the soil of the plot is of that kind which readily bakes, good results would flow if pure sand were added and well mixed with the soil previous to applying the manure. Leaf mold or sandy muck would answer the same purpose. Much tedious after-work may be saved if, while the manure is being dug under, such perennial weeds as show themselves—as Dock, Sour Grass, Plantain, &c.—are pulled out and destroyed.

But whether the soil needs manure or not it should be turned over, pulverized, cleared of all stones and litter and raked to a clean, tidy, level surface, so to remain until the plants are set in it, when another going-over will be necessary. Those who prize their beds of hardy herbaceous perennials, will see that manure is spread over them in the fall. Of course such plants can not be spaded up now, unless it is desirable to transplant or to divide the roots. But all chips, sticks and rubbish may be raked off, the manure incorporated with the surface soil, the margins rectified and a sightly, cared-for appearance obtained.

DO NOT UNCOVER TOO EARLY.

All plants, such as Clematis, Ivy, Pansy, Hydrangea, Rhododendron, Rose, that have been protected with evergreen boughs, hay or straw, should so remain until all fear of cold snaps shall have passed. A good deal more harm often results from uncovering too early than many inexperienced persons suppose. And the more the covering or protection, the more there is to be feared. Too much is generally used. Some suppose that plants are covered to keep them warm. This is so far from true that they are protected rather to keep them cold, or at least to preserve, as far as may be, a uniform temperature. The same may be said of Strawberries, Grapevines, Raspberries, etc.

THOROUGH WORK.

We advise all of our readers to send to nurserymen and seedsmen for their catalogues. The catalogues of to-day are of much value to those who wish to select judiciously and to plant with a knowledge of the requirements of the plant. Compare these catalogues and study them. Make selections and forward your orders as soon as you can do so intelligently. Then make or provide, substantial labels and mark them neatly and plainly. Choose positions and dig ample holes, wheeling away the inferior earth and wheeling back good earth. Throw it in lightly to await the arrival of the plants. Then without hurry or slight, the work of planting may be performed in a systematic, satisfactory manner. Respecting

LABELS.

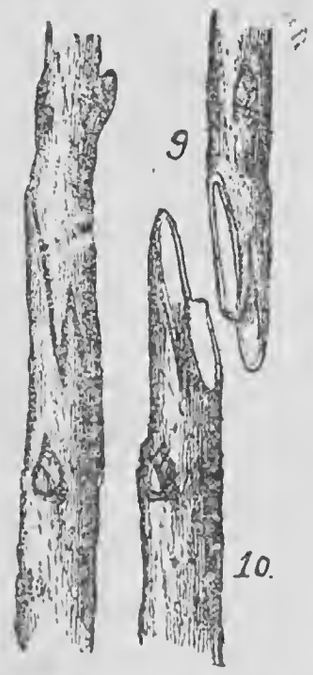
we have a word to say. Five years ago, we had labels made of pine wood of different lengths and widths, but all of the same shape. One end was cut wedge-shape to go into the ground readily. They were given two coats of white paint and with a "penny" paint brush and black paint, the names were painted upon them. The wedge-end was then dipped in warm tar, and after scraping off the superfluity, with a flat stick, sand was sprinkled upon all sides. They were thus in a day or so enveloped in almost stony and impermeable coverings. We have used these labels for five years and they are still apparently uninjured by moisture and exposure.

GRAFTING.

Few have failed to notice where the branches of trees have intersected and remained in contact for some time, that a union has occasionally taken place between them. From such occurrences, very likely the first hint was given to the early horticulturist that what nature thus accomplished might also be artificially effected. Scores of methods have since been devised and practiced, though for the most part, differing but slightly from those known in Pliny's time and by him described. The inexperienced, to whom alone these notes are addressed, will, we hope, by the aid of the accompanying illustrations, be enabled with a little practice, to graft as successfully, if not as rapidly, as old gardeners.

The difference between grafting and budding is in name alone. In the former we use a part of a branch (cion), in the latter a bud which is but an undeveloped branch. Bud-grafting and cion grafting are more appropriate and less confusing terms. If we cut off a piece of

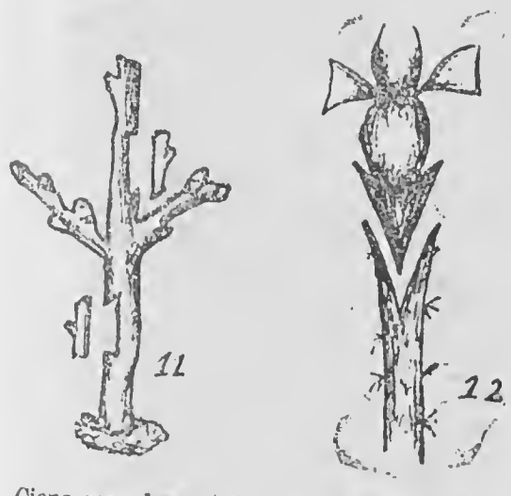
a shoot of a gooseberry bush and place it in soil, roots readily issue from the extremity and the shoot becomes an independent plant. This, before it has made roots, is called a cutting. If the end, instead of being placed in the soil, is cut smoothly wedge-shape, (Fig. 1), and placed into a slit made in the stem of a currant bush, it is then called a cion, and the stem into which it is inserted is called the stock, (Fig. 2).



Instead of deriving nourishment from its own roots, the like parts of both having grown together, the currant is to the cion what the roots and soil were to the cutting. Between cions and stocks which thus become, as it were, soldered together, a close similarity of nature and structure is essential. We may generally work different varieties upon the species—as a Baldwin upon other apples—less often different species upon each other, as an apricot upon a plum, rarely different genera upon each other, as a lilac upon a privet.

The corresponding parts of the cion and stock should be placed in contact or rather the layer which seems to divide the bark and the wood, but which really unites them, should be placed in contact, for which reason the wedge-end of the cion should be cut as nearly as possible to conform to the slit of the stock which is to receive it.

This is the one important thing about grafting. As the annual growth takes place between the wood and the bark, it is plain that this is precisely where the two parts will begin to grow together. Many novices think it necessary that the outside bark of cion and stock should be placed together. But except when the entire bark of each is of the same thickness the outside bark of the cion will always be perceptibly within the other.



Cions may be cut in the fall and preserved fresh in sand through the winter. Or they may be cut now and so preserved until needed. The best time for grafting varies with different plants and the season. No infallible date can be given. The best time is just after the buds begin to swell, and we feel assured that the time for cold snaps is over. The plum and cherry may be grafted earlier, the apple and pear later, even after the buds have broken. Root grafting, largely adopted by nurserymen, for the apple and some others is performed throughout the winter, the roots having been taken up in the fall, washed and carefully packed in boxes of moss. We have not space to describe this in detail. Fig. 17 is the cion, 18 the root-stock, 16 shows the operation completed.

CLEFT GRAFTING

is the method, which we advise the experimenter to adopt in his first essays, especially where the stock is much larger than the cion. Fig. 1, is the cion ready to be inserted into the cleft of the stock, Fig. 2, or one on either side as in Fig. 5 and 6. When but one cion is used, it is better to pare off the other side as in Fig. 3 and 4.

Splice grafting is the next easiest and most effectual method when the cion and stock are the same or nearly the same size and neither is more than an inch in diameter. The wedge of the cion Fig. 8 fits into the notch of the stock, Fig. 7. Both are pressed firmly together and bound with yarn, bast or tape, and then covered with grafting wax or any other tenacious, yielding substance that will not be washed off by rain and that will exclude air from the covered parts.

Two years ago we grafted the Weeping Privet (a variety of Ligustrum vulgare) upon what we call the California Privet (L. oyalifolium) to ascertain which would succeed best, the splice or cleft graft. Eight of each were tried. All lived, however, and seemed equally strong and vigorous. Figs. 9 and 10 show a form of splice grafting which is more effectual than binding plain surfaces together, in that the tongue holds them more securely when bound. Fig. 11 represents a mode of

SIDE GRAFTING

which may be practiced when one has acquired a little skill and desires to display it. Grapevines may be grafted by this method when dormant, near the ground, and covered over with earth until the next spring.

Fig. 12 shows how many species of the Cactus family may be worked upon each other, Pereskia aculeata being often used as the stock. Pelargoniums of different colored flowers and foliage may also by the same form of cleft grafting, be worked upon a single stock, and very interesting plants secured.

Figs. 13, 14, 15 show a mode of herbaceous grafting, as in grafting the tree Peony upon the tubers of the herbaceous Peony, or the Dahlia upon its own tubers. In Fig. 19 we have a modification of side grafting the cion of which may

be cut smoothly concave, or with a tongue as at D. The lower end (C.) is immersed in a vessel of water or moist soil, and may thus derive an auxiliary support while above, it is uniting to the stock. In Fig. 20 we have precisely the reverse of the method shown by Fig. 12. The cion (*a*) is made to fit over the stock (*b*), the completed operation being shown at C.

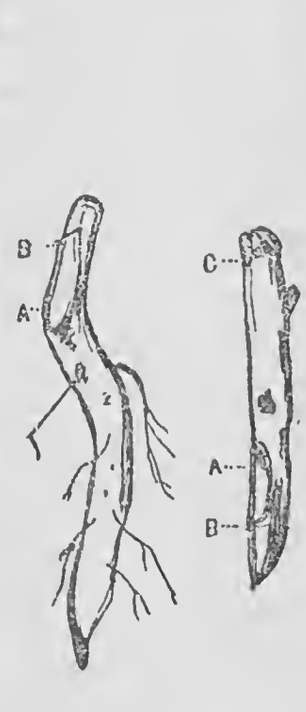
REMARKS.

We have often thought that when the simplest parts of a simple thing are described at length, much mystery is thrown over all, and the beginner applies himself to a study of what he already knows. Let him bear in mind that he is merely to place like parts of one stem upon those of another; that all cuts are to be made as smooth as possible and the union securely bound together. This, with what has been said, and the aid of the accompanying illustrations, should enable any child, twelve years of age, to do ordinary grafting successfully.

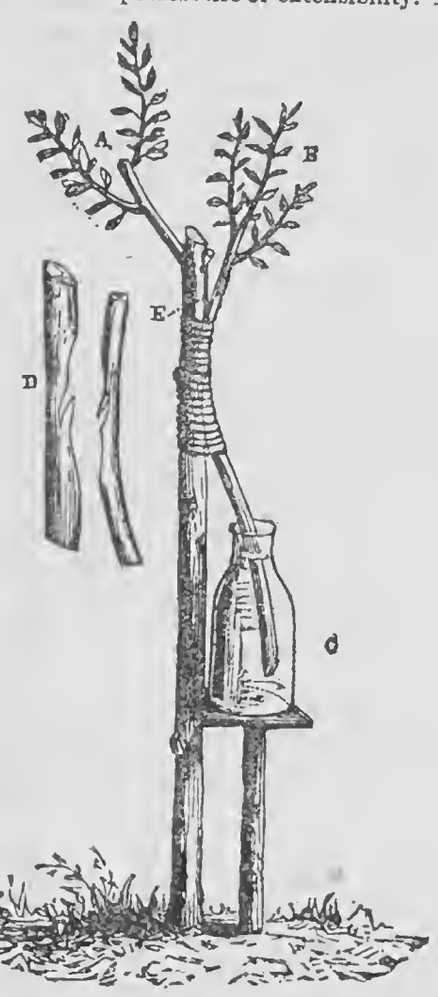
"HIDE-BOUND" TREES.

T. H. HOSKINS, M. D.

It seems to me that the use of this term is unfortunate, because it misleads the hasty thinker into the supposition that there is a real analogy between the living and elastic skin of an animal and the dead and rigid bark of a tree. Only the inner layers of the covering of the trunk and larger branches possess life or extensibility. The



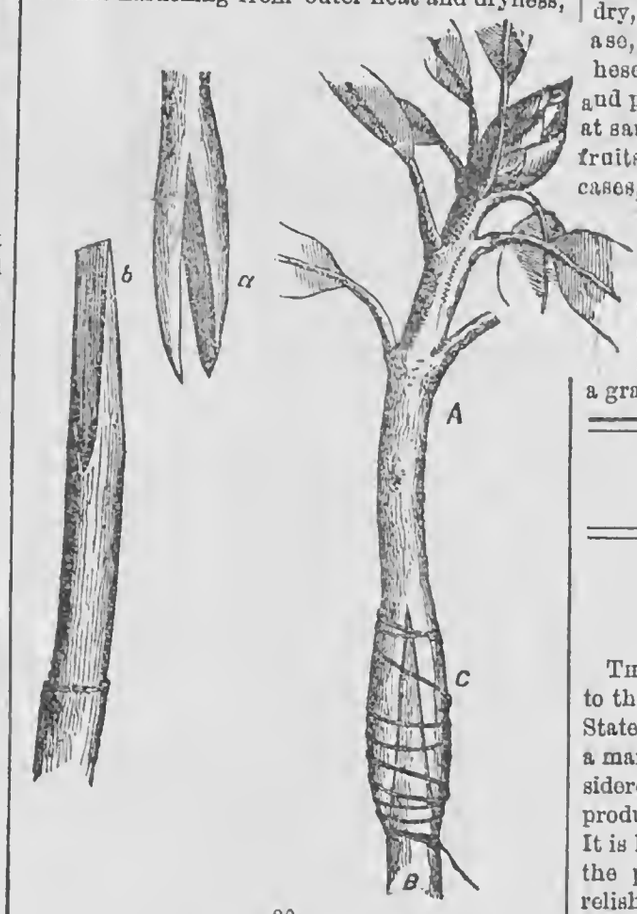
18. 17. 16.



19.

outer bark yields to the growth of the tree, not by elasticity but by rupture, and if the chemico-vital action developed in the tree is feeble, it may be unable to "burst its cerements," and thus enlarge itself in the natural way.

When the tree is continuously thrifty, it "keeps things moving," and during the growing season pushes open the texture which envelopes it by a continuous pressure which does not allow of that hardening from outer heat and dryness,



20.

and from interstitial deposits of mineral matter, which finally incases the weakly tree with an armor that it cannot throw off, and which still further enfeebles it by its constricting action upon the sap vessels.

Until it was brought out in the recent correspondence of the RURAL, it had not occurred to me that any one would undertake to relieve this constriction by slitting the bark at any other time than early in the growing season. A very little reflection would teach one that as "the time to catch bears is when bears are around," so the time to relieve this pressure on the growth of the tree, is when the tree is growing. There can be no question that slitting the bark in the fall or winter would produce an injurious, rather than a useful effect. It is no doubt true, also, that only under exceptional circumstances is a good orchardist who attends to his trees and keeps them thrifty, obliged to resort to this sort of surgery.

Newport, Vt., Feb. 22.

THE PRACTICE OF SEED PLANTING.

S. RUFUS MASON.

The presence of warmth and moisture, and the absence of light are the necessary conditions under which healthy germination takes place. Peas germinate at a comparatively low temperature, have very tender, succulent roots and stems, and are quickly destroyed by excessive heat; therefore, in a sandy soil they must be planted four inches deep, but in a heavy clay, only two and a half to three inches. In deep planting, it is not necessary to compact the soil over the seed, as the sun cannot penetrate so far, early in the season, as to dry the young roots. But all small seeds to be planted early, should have a sufficient covering firmly trod down by the feet, to exclude the drying effect of both sun and wind. This "treading in" secures moisture as well, and does not prevent the warmth of the sun from reaching the seed. If the 1st of April allows the ground to work mellow and free from wet, plant Peas four inches, Beets two inches, Carrots one inch, Lettuce one-half inch, Radish one inch, Parsnips one inch, Onions three-quarters, Turnips one-half inch deep, and tread them in firmly. This calculation is made for a medium light soil; if the soil is very light, plant deeper; if very heavy, plant shallower.

Beans, Sugar Corn, Melons, Squashes, Cucumbers etc., should not be put in till May 10th, and then about one-half inch deep upon hills level with the surface (with a depression around them) on light soil; or in hills raised above the surface, for heavy soil. All these seeds require much warmth and moisture to start them. Make the ground quite firm as before.

As Cabbage, Cauliflower, Tomato and Pepper seeds are always started in boxes or hot-beds, I shall not consider them in this article.

With these general ideas, the soil of the garden is the next item. Let every farmer have two gardens, side by side if he likes, but totally separate. Plow the ground early in the season, haul on enough manure to cover it five inches deep, plow again so as to turn it all under six inches; then haul on two inches more and mix that just below the surface with a shovel plow, cultivator or any suitable tool. This gives a stratum of rich soil at top, warm and light to induce prompt and healthy germination, and another two or three inches under it, as a support to the plant when summer heat becomes powerful. If the season should prove wet, the feeding roots will form in the top stratum; if dry, they will seek the lower one and in either case, strong growth will be certain. Let one of these gardens be devoted to vegetables entirely, and plow it every spring, adding manure on top at same time; the other patch plant with small fruits, bushes, vines and asparagus. In both cases, rows should run north and south. The fruit patch will require stirring with the plow or cultivator once in two years. Remember one thing in the outset: if the crop to be grown is weeds, just prepare the soil, plant the seeds, and "let it alone," and no matter what vegetable seeds are put in, a grand crop of weeds will follow.

The Garden.

THE TOMATO.

CHARLES B. DECKNER.

The writer has devoted considerable attention to the cultivation of the Tomato, first in the State of Wisconsin and for twelve years past on a market garden near this thriving city. Considered either as a fruit for the table, or as a product for market, it is worthy of high esteem. It is healthful in its effects, and as agreeable to the palate as it is inviting to the eye. As a relish, it is at the breakfast-table the peer of that delight of the epicure,—the cantaloupe. Served fresh from the vine, it is palatable and wholesome, while it may be served as a cooked dish in half a dozen different styles. In the vegetable season, no table is complete without it, and no canned fruit is more acceptable in winter. Add to the good qualities already mentioned, the immense yield of the Tomato, and it is not surprising that the subject of its culture is receiving so much attention.

HOW TO PLANT AND WHEN.

The time for planting varies with the climate. The March season of Georgia is the April of New York State. Every section must be governed by the usual closing of its season of frost. Two months prior to the last expected frost, seed may be sown in hot-beds, or if—as is the case with the great majority of families—no hot-bed is on the premises, then in small boxes which should be placed on the window-sill in some room which is kept warm. This will furnish plants which, properly cared for, will be about ready to begin bearing by the time the sunny days of spring have arrived, when they can be transplanted into the garden. One paper of seed will be sufficient to supply an ordinary family. Twenty-five Tomato vines, properly cultivated will supply an average boarding-house for a season.

IT IS BEST TO TRANSPLANT

from the boxes or hot-beds when the plants are two inches high, that they may have space in

which to grow. In the hot-beds or in large boxes, four inches should divide them each way. In the house, small flower-pots may be used, one plant being set in each pot. The expense is nothing, and the enhanced earliness of the crop of fruit secured, will compensate handsomely the care required. In the hot-beds, if considerable growth has been obtained before it is warm enough to transplant into open air, additional space should separate them: say eight inches. Transplanting into the garden should be delayed until all danger of cold, wet weather and frost is past. The plants will fruit sooner if nursed under glass until the first blossoms appear. I have profited by keeping them thus protected until first fruit had developed. After the last transplanting in the hot-beds, leaving the plants eight inches apart, they require but little attention. The glass may be removed when the temperature of the atmosphere will permit and only replaced when the nights are cold, or the weather cold and wet. In severe weather additional protection should be afforded by covering the glass with boards, cloth, straw or hay. The great point of success in cultivating the Tomato is in keeping it from the effects of frost and cold, wet weather.

THE SOIL

best suited for the Tomato is a dark, warm, sandy loam. If it is rich from having been fertilized the previous year, a light application of ashes or guano will stimulate a quick growth. If the land is poor, apply rotten stable manure heavily.

HOW CULTIVATED.

Having been properly prepared, the land to be planted should be laid off in squares, four by four or four by six feet. I prefer the latter dimensions. At the corners of the squares, or where the lines intersect, dig out a hole sufficiently large to admit the plant with the soil clinging to the root. From their winter residences transplant the vines into these holes: rake the surrounding soil and compress it firmly about them with the foot, and they are established in their summer quarters.

The space between the rows, six feet apart, may be planted with some vegetable of short duration, such as peas, beans, radish, lettuce, etc. It is necessary that the vines, when well started to growing, should be tied up to stakes, some three feet high, as when allowed to fall upon the ground, any part in contact with the soil will take root, thus diminishing productiveness.

To secure a well-flavored Tomato, the fruit should be protected from exposure to the sun. This can be accomplished by clipping the extremities of the branches. If allowed to grow very long, the vines shed their lower leaves leaving the lower fruit exposed. The clipping invigorates the vine and produces heavier fruitage as well as fuller foliage to protect the fruit.

VARIETIES.

My experience has proven the Trophy superior to all other varieties for combination of the qualities desirable for family use. It is large, smooth and well flavored. If there is an objection to be urged against it, it is that it does not ripen so well at the stem as some others. But when size is not sought after, and earliness of maturity is the chief desideratum, Hathaway's Excelsior is the most desirable variety. It is a medium-sized, smooth, red Tomato, of excellent flavor, and ripens fully a week earlier than any other. Next in earliness, (and it is a good Tomato too), is the familiar Early Smooth Red.

ROT

is caused by long spells of warm, wet weather, and also by heavy dews, succeeded by warm, sunny days. It will not occur from the latter cause, however, when there is a free circulation of air among the vines. To secure this, the vines should not be crowded too near together, nor should weeds be allowed to grow about them. The fruit affected with rot should be removed from the vines, as worms sometimes infest it, and if not removed, the worms will soon find their way into and destroy the sound fruit.

The Tomato has another enemy in the worm. There are two kinds which are destructive. One is essentially, in habit, like the tobacco worm, and can easily be detected and destroyed. The other cuts its way into the green fruit, burrowing therein until the fruit is decayed, when it moves on to another. But where vines are properly raised and trained from the ground, there is little damage to be apprehended.

Atlanta, Ga.

BRUSSELS SPROUTS.

Why is this delicious vegetable so little known? Its cultivation is easy, the seed which must be of a good strain, should be sown in the spring, in the same manner and time as for winter cabbage. When the plants are of sufficient size, transplant to about a foot apart each way. In ordinary seasons they may be had for the table from first of October to Christmas. The plant is quite hardy, and its numerous small heads become very tender when touched by frost. Boil and serve as you would cauliflower.

WATERING PLANTS IN POTS.

No. II.

WILLIAM FALCONER.

Most plants require more water in spring and summer than they do in winter; but many want water in winter and none in summer; others, water in summer and none in winter; and in the case of several others, the water supply should be guided by the conditions of growth. But be it summer or winter, or under natural or artificial conditions, plants usually require the most water when they are in active growth. True, the woods and fields are sometimes inundated in winter when plant-life is dormant, and often comparatively dry in early summer when vegetation is busiest, in which cases the flood may be harmless on account of its low temperature, perhaps in some cases beneficial in prolonging the season of "rest," but at any rate, I'd prefer unflooded land as productive of the happiest results.

Many plants, require to be kept moist all the year round, as Palms, Camellias, Azaleas, India-rubber trees, Myrtles, Mahernias, Dracænas, Daphnes, Acacias, Heaths, Epacrises, Jerusalem Cherries, and evergreen, herbaceous and shrubby plants generally. But even these require less water when they have completed their growth than when they are growing or flowering. Calceolarias, Cinerarias, Stevias, Chinese Primroses, Chrysanthemums, Carnations, and such like plants, whether treated as annual, biennial, or perennial, require plenty of water at all times while they remain in pots. The same may be said of Cyclamens, and Calla Lillies, though many good growers lay the pots on their sides to dry these off after they have done blooming.

GROW IN SUMMER AND REST IN WINTER.

Achimenes, Gloxinias, tuberous-rooted Begonias, Gloriosas, some Gesneras, Cissus discolor, Amorphophallus Rivieri, spotted-leaved Caladiums, and the like, don't require a drop of water for three or four months during the winter time, but most of them drink heartily while growing. I may also say that the finest Lilium speciosums I ever saw grown were potted in November, kept dry in a cool green-house till their shoots peeped above soil in March, when just a little water was given near the edge of the pot, gradually increasing it as growth proceeded, till heavy libations were applied. This proves that though these lily bulbs are wintered in moist earth in the garden, in pot culture they should be kept dry, and so it is with many other bulbs. Fuchsias, Lemon-scented Verbenas, Coral Plants, Crape Myrtles, Lantanas, and several other shrubby plants if not young and sappy, winter quite well when kept dry and cool—say in the cellar, shed, under the green-house stage or in any other safe out-of-the-way place. Poinsettias require the same treatment for two or three months after they have done blooming; only they require warmer quarters, say 45°. Araujia, climbing Clerodendrons, Allamandas, Stigmatophyllums and some other hot-house climbers start to grow more vigorously in spring, and blossom more concentrated and lavishly if subjected to a long winter's drouth.

GROW IN WINTER, REST IN SUMMER.

By September Oxalises are transposed from the bureau drawer to flower-pots; the Elephants-foot Creeper sends forth a shoot; "Smilax" runs, Tropæolum tricolorum shows its stringy vines, the Canary Islands Bell-flower (Canarina campanulata) begins to grow, and a host of Cape bulbs, as Lachenalias, Ixias, Babians, and the like are buried, for a New Year to Easter show. During the summer time these receive no water, but little after they are potted till roots are forming, then gradually more, till the flowers are gone and the foliage turns seedy, when water is gradually withheld and ultimately stopped.

BEDDING PLANTS.

Bedding plants as cuttings in store pots or boxes, require very little water in winter, only enough to keep them from wilting, but towards March, when growth begins and demands for food increase, more water should be given in proportion; but always bear in mind that too little is better than too much. The variegated Mesembryanthemum, Othonna, blue leaved Kleinia don't require a drop of water from Christmas till Easter unless good growing conditions are theirs. Coleuses, Achyranthuses, and Alternantheras, winter better and endure in safety a much lower temperature if kept very dry than moderately moist. Of course, in warm greenhouses a little water may be beneficial through the winter months, but in other cases drouth is preferable. From the middle of March onwards when growth is desirable, more water is necessary as it also is in the case of newly potted plants.

SEEDS.

Seeds should be sown in moist earth and care taken to prevent it from drying rapidly. This is done by keeping the pots in shady places, covering them over with shaded glass, paper, or some damp moss or grass, till germination appears. After this, gentle sprinklings are preferable to sudden splashes, and to prevent a too frequent repetition of the operation, if the pots be stood in saucers, and thus be fed underneath instead of above, the lives of many delicate seedlings will be saved. Young seedlings should never get dry, nor should they be kept sodden.

CACTUSES AND OTHER SUCCULENTS.

Most of these can be wintered in dry airy cellars or rooms, providing they be kept rigidly dry, but, like other plants, while they are growing they like plenty water. Cape of Good Hope species, as those of Aloes, Sempervivums, and Crassulas, like a little water in winter if their quarters be good, as many of them bloom at that season. Unless to remove dirt or vermin, syringing does them little if any good, and in the case of densely hairy or spiney kinds, as many Mamillarias, Cereuses, and Echinocactuses, showerings overhead, in winter whatever, are quite hurtful. Of course there are exceptions in the case of young stock or that in exceptional quarters. A humid, muggy atmosphere is killing to Cacti. Cotyledon farinosa, pulverulenta, and other powdery-leaved kinds should not be wetted overhead, neither should Kleinia tomentosa nor others of that class.

FERNS.

Filmy ferns require a close, damp atmosphere and daily dewings overhead, summer and winter. Some growers say—keep them in a saturated atmosphere but don't wet the leaves; well, that is gospel for winter in England, but I must see, in results, the superiority of such doctrine before I'll adopt it in America. All ferns are very thirsty while growing, and some Pterises, Aspleniums, Dicksonias, Cyatheas, Polypodys, Todeas, Woodwardias, and the like, enjoy a shower-bath on summer afternoons. Maidenhair (Adiantum) Gold and Silver Ferns (Gymnogrammas, Cheilanthuses and Notochlænas), and a few other powdery or downy forms are much more injured than benefited by wetting their leaves. Many ferns while at rest suffer a deal of drouth with impunity: indeed, Adiantums, Pterises, Onychiums, and some others may be cut over in the fall and stood on a damp floor, in a cool green-house without getting a drop of water till February, and they will rise in March and April clean and bright. Too much drouth would kill them or irreparably weaken them. We have some very beautiful Pælleas from California, and which are found in dry, rocky or sandy places; indeed, collectors of them have assured me that they undergo severe drouths for a considerable period, but as pot plants they are about the most particular genus I know of as regards moisture; subject them to half the drouth an Adiantum could bear and they die outright.

BULBS FOR THE FLOWER GARDEN.

W. C. L. DREW.

ZEPHYRANTHES.

These are handsome little bulbous plants nearly related to the queenly Amaryllis. They were formerly, for many years, classed under that genus, and are even now frequently sold as a species of Amaryllis under the pseudonym of of A. Atamasco. They are now recognized as a distinct genus by the best botanical authorities.

The Zephyranthes are alike valuable for pot and border culture. For pot culture they are particularly valuable as they flower, if properly treated, in from twenty to thirty days after planting. For this kind of culture, the bulbs may be planted at any time during the winter, in six-inch pots filled with a moderately rich, light loam, four bulbs in each pot. Plant the bulb so that at least one-third of its length will be above the surface of the soil; water and set in a warm, dark closet for seven or eight days; then remove to the window or green-house, setting the pot as close as possible to the glass.

For border culture, keep the bulb dry until about the first of May; then plant in light, rich soil, being careful not to entirely cover the neck of the bulb. Plant the bulbs in clumps of three each for a good display. Set in this way, the bulbs will flower three or four times during the summer.

The flowers are produced on foot stalks about ten inches high, and are finely adapted for bouquet making. They are like miniature Lilies in shape and are very beautiful. There are several varieties in cultivation, all desirable. Z. candida is a very hardy variety, in many localities enduring the winter in the open ground; the flowers are snowy white.

Z. rosea is a very pretty plant with rose-colored flowers, frequently with longitudinal variegations of white; this variety is often sold as Fairy Lily. Z. Atamasco is a white variety, the flowers having a pearly appearance. Z. Vilmoriensis is a comparatively new variety, large white blooms. Z. chloroleuca has a pretty orange yellow flower and is unique.

SCHIZOSTYLIS.

This is a very neat plant of recent introduction. As yet it is rather scarce, and in view of the number of good things which have been neglected by amateurs, it is not likely that it will ever be very extensively cultivated. The flowers are very pretty and resemble somewhat those of the Ixia, the bulb requiring similar treatment. The flowers which are borne in long spikes, are of a velvety texture, the color being a bright scarlet crimson, much darker towards the center of the flower. I am acquainted with only one variety, S. gigantea. It is well worth cultivating.

EXCHANGE.

Another season of buds and flowers will soon be here, and often during the long winter days have I formed plans for my flower garden and seen, in imagination, the bright floral treasures I hoped to cultivate the coming season. I was very successful with my exchange last spring. I received much that was valuable; and O! the interesting letters from Rural friends have been like so many pleasant conversations that will long hold a bright place in my memory. And you, dear Rural, I sincerely thank you. Long may you live, and carry your pure, elevating influence to every fireside throughout our land, and gladden the hearts of many thousands. I will give a list of the different varieties of seed I have for exchange:—Aquilegia double, blue; Digitalis, new spotted; Fenzlia dianthiflora; Pansies, best varieties mixed; Phlox Drummondii; Poppies, double, mixed colors; Salpiglossis, scarlet finely spotted; Sedum Aizoon, yellow flowered; Sweet Williams, mixed; Lavender. In exchange, I should like to get any of the following seeds or *plants*:—Daisies (double), Gypsophila, Pentstemon, Statice, Pampas Grass, Wistaria (plants), and Holly (the variety that bears the berries used for winter trimmings) To those wishing a few flower seeds and having nothing to send in return, if they will send me a stamped and addressed envelope, I will forward them seed by return of mail. Mrs. C. Cox.

North Bass Island, Ottawa Co., O.

Miscellaneous.

"THE SNOW—THE BEAUTIFUL SNOW."

S. B. PECK.

The lumberman's winter has just begun. Thus far, there has been no snow to help him. He has waited with the best grace he could, till patience was nearly exhausted and hope almost abandoned. He could have watered his roads and trusted to "Jack Frost" to pave them with ice; but the thermometer, instead of favoring this process, has, except for a very few days, persisted in staying above 32° since the beginning of the old-fashioned winter.

Now the prospect brightens. Mercury, like Lucifer, has fallen, and down comes the feathery snow, lubricating the roads, lying like a fallen tree, where it falls—for no winds penetrate the forests; the roads are broken as the snow falls; the wet places and the frozen lakes to be crossed are tramped to promote congelation, till the whole path becomes a solid bridge. "Then comes the tug of war." The woods swarm with men, horses, and oxen, all ready and eager for the fight. The blows of the sturdy axmen echo from over the hill; the soft whispering of the saw is heard; near by the scaler's hammer whacks the owner's mark into the log's end, and echo says, "Whack!" Now the monarch pine of a century comes roaring as he brushes his fellows, and crackling, crashing, thundering, plunges down, shaking the earth. No sooner is he prostrate than axes and saws are upon him, stripping him of his branches and cutting him into huge pieces, ready for his over-land and water journey to market. Bushes crackle under the tread of teams, chains rattle, cant-hooks grapple, and off goes a burly log over hummocks, bushes and fallen trees, propelled by the sturdy and patient oxen, and is laid snugly beside its fellows upon two parallel skids, ready for their transit by the more supple horse teams. Men "jump at the conclusions," and the inevitable "bobs" are loaded with a number and weight that would make any one but a logger stare; but the trained horses flinch not, and soon convey the monstrous load beyond our sight.

Anon comes a booming sound, like that of distant cannon, and we know that the logs are tumbled against their fellows, down the river's bank. And so this round of motion, muscle and sound goes on. The bluejay screams at it, the partridge retreats whirring to the thicket, the deer with sprightly bounds, seeks the swamps; but men and teams "pursue the even tenor of their way" till darkness drives them to their rude, but hospitable shelter.

The flora of America—and perhaps of the world—presents no sight more grand and magnificant than the unbroken pine forests. Tow-

ering up almost out of sight, with their tufted tops gently waving in the breeze, as if making obeisance to Æolus, with their needle leaves fluttering like a frightened bird, they inspire in the heart of a stranger an awe unlike that produced by Niagara or Yosemite; but more pleasing to the eye and more gratifying to the greed of the lumbermen, who change this scene of beauty and grandeur to one of ruin and desolation. Time dries the severed branches and refuse timber, the parching winds and scorching sun fit them for torches, the inflammable pitch oozes from the ax wounds, and a fire is started perhaps by a hunter or a smoker, or by the tears of pitch acting as a lens, and the entire mass of living and dead vegetation falls a prey to the all-devouring element, leaving only here and there a blackened mass of charred timber. Time goes on, nature, ever abhorring a waste as well as a vacuum, starts up innumerable embryo trees; briars, brakes, and thistles spring up under the stimulus of the ashes, hiding the desolation until another class of occupants, possessing more refinement and sociality, shall take possession of the premises, and fit them for the permanent abode of man, and for the enjoyment of society.

Muskegon, Mich.

PINUS AYACAHUITE.

[The following, kindly furnished by Professor Sargent, would have been published in the Rural of February 2, page 71, which presented an engraving of Pinus Ayacahuite, but owing to miscarriage, the letter reached this office only in time for this issue.—Eds]

This is a large tree growing from 100 to 150 feet high, a native of the mountains of Mexico, and botanically closely related to our White Pine, which it somewhat resembles, or perhaps in part, color of the bark and cones it is more like the P. excelsa. It was introduced in 1840 into Europe by Hartweg, and is said by Carriere to be hardy in the climate of Paris. I don't remember to have seen it there or in England, and possibly the severe winter of 1860 may have killed it, as it did nearly all the Mexican conifers, which before that time were exceedingly fashionable in Europe. Pinus Ayacahuite would succeed in southern California and western Texas, and possibly in Atlantic and Gulf States south of Georgia; but probably nowhere else in the United States. As an ornamental tree it is hardly superior to our White Pine. C. S. Sargent.

Botanic Gardens, Cambridge, Mass.

DIOSPYROS KAKI.

Mr. Hollister presented to the California Academy of Sciences a specimen of Japanese persimmon, grown in an orchard at Santa Barbara. He remarked that the tree is highly ornamental, a prolific bearer, and as hardy as a pear. The fruit is of a bright yellow or orange-color, and seems more like a little ball of wax than a fruit. He thinks it will be the greatest acquisition to the State ever introduced. It grows, he says, to a large size, attaining, in some cases, a pound each in weight. It is well adapted to the soil of California, and may be cultivated the same as an apple. The grafted tree bears in about four years; seedlings require double that time, and are not reliable.

CATALOGUES, &c., RECEIVED.

Ward's Dairy and Breeding Calender. Price 10 cents.

L. W. Goodell, Amherst, Mass. Catalogue of choice selected seeds and bulbs—free.

John Saul, Washington City, D. C. Catalogue of new, rare and beautiful plants, Dahlias, Chrysanthemums, Geraniums, Fuchsias, Carnations, Verbenas, Phloxes, etc. 100 pages illustrated. Plain copy free. Ten cents with a large, showy, colored lithograph of the Pelargonium, "Mrs. John Saul."

J. M. Thorburn & Co., 15 John Street, N. Y. Catalogue of French Hybrid Gladioli, and other spring Bulbs. All of our readers who intend to select any of the above, will do well to send for this.

John S. Collins, Moorestown, N. J. Wholesale price list of small fruits, fruits trees, berry crates and boxes. "Great American" and all the best strawberry plants. Free.

The Bellevue Nursery Co., Paterson, N. J. An Illustrated Catalogue of 80 pages.

Guimes & Garrow, Pittsburgh, Pa. This is a modest, but a good catalogue of 32 pages, enumerating fruits, flowers and seeds. It presents an excellent list of Grapevines, Strawberries, Raspberries, Blackberries, and Currants; fruit trees, evergreens, bedding, plants, Roses, Gladioli, vegetable seeds. Special offers are made which seem very liberal. It will be sent free to applicants.

B. K. Bliss & Sons, 34 Barclay Street, N. Y. Illustrated Spring Catalogue and Amateur's Guide to the flower and kitchen garden. A work of 204 pages. The colored frontispiece is exceptionally pretty and well worthy of a frame. Among Godetias, Carnations, Petunias, Ipomœas, Pansies and many others there shown with much fidelity, we recognize the strange calyxes and flowers of the Shell Flower, (Molucella lævis) that the Rural New-Yorker popularized last year, and which is now for the first time offered for sale. We take much pleasure in commending this work to our readers, knowing that it is worthy of being bound and retained as a book of references as well as for present use. The price is but 35 cents.

Also, Illustrated Hand Book for farm and garden, and abridged catalogue of garden, field and flower seeds, 100 pages. Price 3 cents.

Also, Illustrated Catalogue of Plants for greenhouse, conservatory, lawn and flower garden. Also Illustrated List of Novelties for 1878. Mailed free to all.

Rural Architecture.

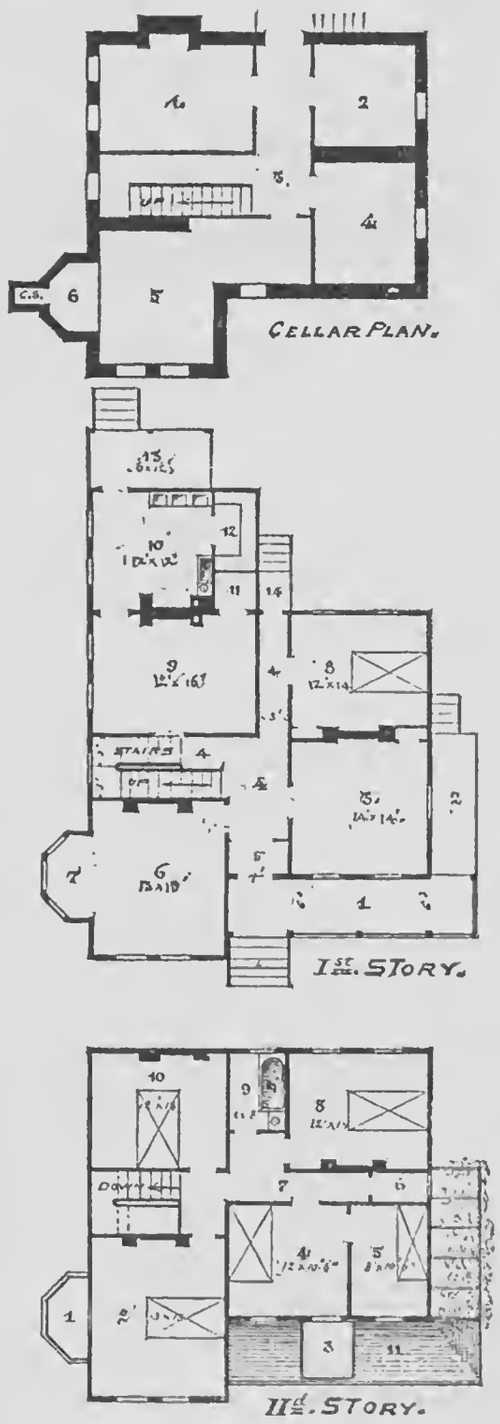
A CHEAP, CONVENIENT HOUSE.

As the Rural devotes some space to architecture one of its friends would like to ask it to

ELEVATION.

furnish an illustration and ground plan of a house to contain a parlor, hall and stairway, and sitting-room and bed-room off of same, with dining-room, kitchen and pantry in the rear. The house to be two stories high with

PLANS.



square or hipped roof. A plan, and front elevation of a house as above described will greatly oblige. A. H. Beihtler.

Marysville.

Ans.—In compliance with the request of our correspondent we publish to-day designs for a country residence, which we hope will meet his approval. The elevation represents a two-story house with cellar and a veranda in front, bay-window, on the side, and kitchen extension. The divisions of the differentstories are as follows, viz:

Cellar plan: (1) Washroom; (2) Vegetable cellar; (3) Passage; (4) Provisions; (5) Wood; (6) Coal-bin with Coal Chute. *First Story*: (1) Veranda; (2) Trellis-walk; (3) Sitting-room; (4) Hall; (5) Vestibule; (6) Parlor; (7) Bay-window; (8) Bedroom; (9) Dining-room; (10) Kitchen; (11) Closet for dining-room; (12) Pantry; (13) Veranda; (14) Stoop with back steps.

Second Story: (1) Balcony; (2) Bedroom; (3) Balcony; (4) and (5) Bedrooms; (6) Linen-closet; (7) Hall; (8) and (10) Bedrooms and (9) Bath-room with water-closet.

For any additional information regarding our architectural designs, inquiries addressed to this office will be cheerfully answered.

Everywhere.

RURAL SPECIAL REPORTS.

Harborton, N. J., Feb. 28.

Roads bad; prices of grain low: times dull. Corn, 47c. per bushel; oats, 25@28c; wheat, $1.10@1.20; hay, $12 per ton, prime timothy; dressed hogs, $4.75@5 per 100 pounds (lower than they have been for over twenty years); veal calves, 7½c. per pound.; butter, 30@32c. per pound. Fresh milch cows are about all that will bring good prices. They bring from $50@60 each at vendues. Grain in the ground looks well, where not sown too early last fall.

D. J. B.

El Dorado, Feb. 23.

We have had no mail for a week, but rain, rain in endless quantity. The Sacramento was higher than ever before known, the railroad track between here and Sacramento was washed away, also the bridge, so we had to get along without our usual mail for a week. I never knew the ground so full of water. In Sacramento there was great fear of a flood, in fact, at one time the water was a foot or so high all around the Capitol building. A good year in California is certain, while a few are washed out of everything, the majority are jubilant.

W. C. L. D.

Marshall, Mich., March 1, 1878.

Spring opens fine. We have had a very open winter; not over five days of sleighing. The roads have been almost impassable, but are now drying up so as to allow light loads to be drawn to market. Farmers are generally holding wheat. They could have got $1.30 for it last fall; it is now worth only $1.10, and the market falling. I must go for two or three of your "Cricket" clocks this spring. L. W. G.

Bryn Mawr, Pa., March 7.

The weather hereabouts is remarkable—flowers blooming in the open air and the season seeming to be a full month in advance of its usual forwardness. My husband asked me tonight if I wanted my hot-beds made "right off." I am too much afraid of a March "nip" to be in too great a haste. M. W. F.

Carlisle, N. Y., March 4, 1878.

The weather here at present is very disagreeable, high winds and rain. Wheat is looking well. It is worth 90c. to $1 per bushel; cattle and hogs are selling very well; the former, for yearlings, $30 per head; the latter from $3 to $5.

M. H.

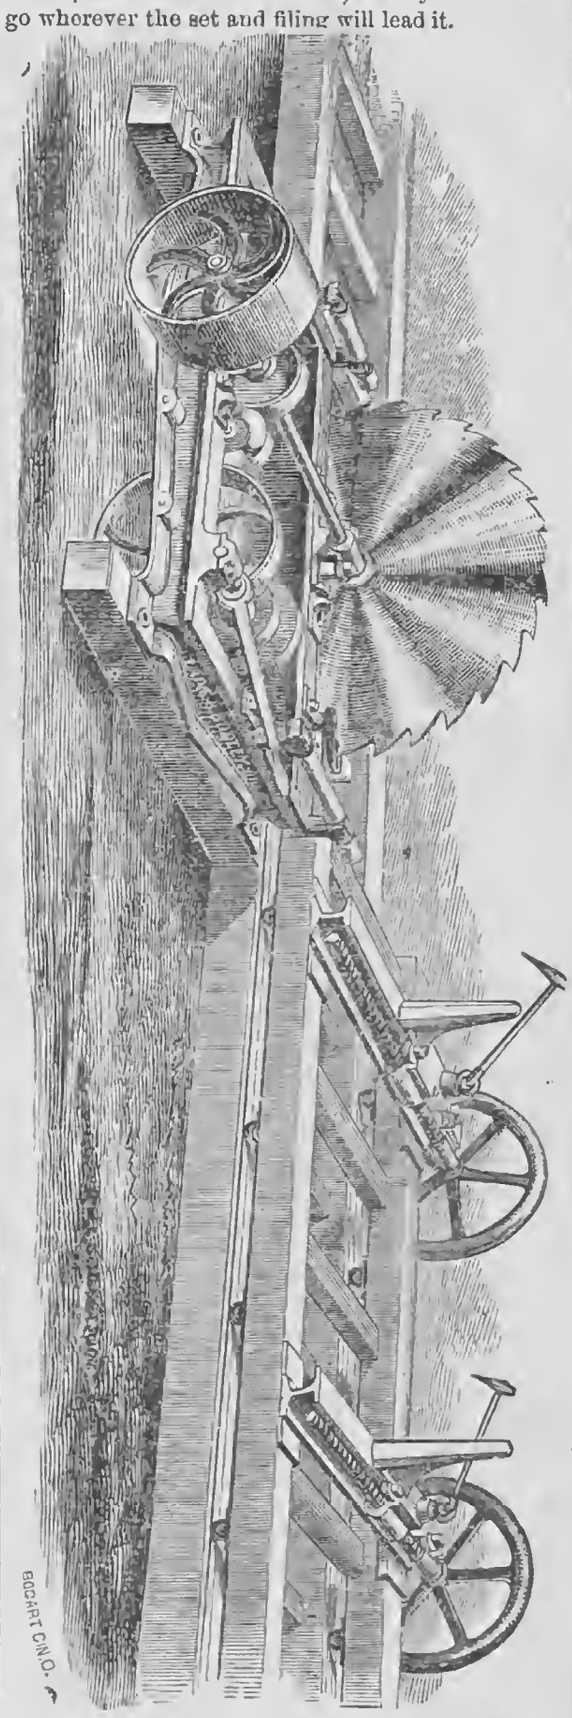
Industrial Implements.

FARM AND PLANTATION SAW-MILLS.

The cut on this page represents a cheap saw mill, to be run by light power, such as agricultural engines or horse power. As the agricultural engine is in use in regular farm work but a small part of the year, it is desirable to find other employment for it. This mill is constructed to meet this want. It will furnish profitable employment to two or three men in cutting fallen timber and supplying the neighborhood with lumber, at a much cheaper rate than it can be obtained in distant cities.

The frame of this mill is of solid cast-iron, strongly braced, and will swing a fifty inch saw. The journal-boxes of the saw mandrel are of ample length to give a good support, and are lined with Babbitt-metal. The saw mandrels are made with great care. The pulleys are truly turned and balanced. The feed and backing works are the best friction device in use. The carriage is 18 feet long, base of head block of wrought iron and the knee is moved by independent screws. The design and material used are all first-class and made with great care.

Many of these mills are running, and with a ten-horse portable engine are cutting from 2,000 to 3,000 feet per day. The quantity of lumber cut per day will depend on the character of the wood and the skill of attendants. Any careful man can soon acquire the skill necessary to run this mill and make good wages. Any person that can file a sash or muley saw, can soon learn to keep a circular saw in order, as any saw will go wherever the set and filing will lead it.



This saw mill is sold for the low price of $188, without saw; and a saw can be furnished for $50 or $60, according to the size.

For further information address the Lane & Bodley Co., Cincinnati, Ohio.

The following interesting item is from the St. Louis Texan:

Judge Tiffany's refrigerator car line has recently entered into a contract with the International and Great Northern railway to furnish all the refrigerator cars necessary to transport the fruit crop of Texas to St. Louis, Chicago and other Northern points. Fruit cooling houses are to be built at Columbia, Houston, Round Rock, Austin, Palestine and other fruit shipping stations as required. The cooling house at Palestine is now under process of construction, and at the other points named the buildings will be erected in time to receive the present year's crop.

The remarkably liberal offer made by the Syracuse Plow Co., on another page, is worthy, and will doubtless command wide attention. This plow is extremely popular and deservedly so. The offer states that for a period of thirty days from date of the announcement the makers will ship free of all freight charges, every plow purchased by those availing themselves of this offer. This coupled with the low price of the plows, considering their workmanship and reputation, is most liberal, and could only be afforded by a company of the standing and resources of the Syracuse Plow Co.

Frequent inquiry prompts us to state that the firm of Russell & Co., Massilon, Ohio, should *not* be confounded with the firm of C. Russell & Co., Canton, Ohio. The latter firm has lately suspended, while R. & Co., on the contrary, are as vigorous as ever, and continue to manufacture and sell the celebrated Massilon threshers and Agricultural steam-engines.

The Boomer & Boschert Press Co., Syracuse N. Y., has shipped to the Paris exposition a complete Wine Press. Those who remember he fine exhibit of this company at the Centennial may be able to judge of the completeness of the French exhibit.

Domestic Economy.

CONDUCTED BY EMILY MAPLE.

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

It is the gray dawn of a March morning, cool and clear. The frost has made slight fantastic shapes upon the window panes in the kitchen, for the fire is out. But it is not cold, and the canary wakes up and shakes his feathers with a lively twitter, while we proceed to clean out the ashes and soot before lighting. It is less trouble in the end, and quite a piece of economy to do this rather distasteful bit of work oftener than is the general rule. I draw on a pair of old gloves long at the wrist, have a good turkey's wing fastened to the end of a stout stick, and a poker with a bent end. Thus equipped, soot and ashes are lifted easily, the latter with an old trowel, into the ash-pan, and all placed in a large brick bin in the cellar. The "siftings" from the kitchen fire are treasures for the garden in summer; for we burn dry Maple and Elm, with a mixture of Cedar and Pine when we wish an extra blaze, and save every particle of this valuable fertilizer.

But while I am talking to you, my hands have been busy, and the kettle is now sending forth a long column of steam for our coffee. Do you think this a pernicious drink in the morning? Well! perhaps it is not according to the laws of hygiene, for we like it strong; but the "guidman" must have his Java, and I do not say "nay." We use the coffee-pot with a single strainer, grind the berry after the kettle boils, and throw it in dry; use no egg or egg-shell to clear; simply pour on the *boiling* water, shut the lid quickly, and let it simmer *but not boil*, for three or four minutes. Our coffee is then a rich amber color, pleasant to eye and taste, while the tight and quick closing of the lid (and if one could take the trouble, a cork in the spout,) and the standing to settle without any stirring, retain the aroma that is lost if the coffee-pot is exposed to an after pouring on the water.

Does it seem fussy over small details? Ah! my dear, life is made up of little things, and on these a great deal of our happiness depends. The fire has burned down to a bed of clear coals; rake them down, and you can make a few slices of toast, for there is nothing like the coals of a wood fire for giving the *flavor* to this breakfast dish. Didn't know toast had *flavor*? Then you have never tasted it made at a coal stove, when by carelessness it imbibed a taste of the gas. And now we can close the dampers; the rest of the breakfast is ready, and with a fresh stick the fire will smolder till needed.

METHOD OF HANGING UP THE WASHING.

"When we build, I am going to have a place in the house where we can conveniently hang the clothes to dry." This has been one of my sayings every stormy washing day since we went to housekeeping until recently. "When we build," however, is still an indefinite time in the future; but I have found a way of hanging the clothes in-doors during the drying process, which is so simple and easily done, that I want the RURAL housewives to know of it. Thus I decided to tell them while comfortably hanging a large washing in our dining-room yesterday, while the wind and snow were holding a grand carnival outside.

All that is required are four strong nails, a line, and two windows or doors opposite, or nearly so. Drive a nail in each corner of the casing of either doors or windows, and tie the rope so that there are two lines passing from window to window parallel with each other.

The manner of hanging up the clothes is where the advantage is gained. We will begin with towels. Take two clothes pins, and pin one corner upon the line; then take the corner opposite and pin upon the second line, and let it hang between the cords. With pillow slips, fasten one-half upon the first line, the other half upon the second, thus only using as much of the line as the clothes pins are wide. For tablecloths and sheets, use four pins, one for each corner. A large washing in this way can be hung upon a short line, but strong nails are required. One can have the clothes ready and hang them in the sitting-room where it is warm, and they will be dry and ready to take down before the family are astir in the morning.

I am very enthusiastic over this plan. I trust it will please the lady readers, and should it make the washing-day easier for any of them, I shall rejoice. M. L. S.

DOMESTIC RECIPES.

Oatmeal Porridge.

WILL you please be so kind as to give recipes in your department for making Oatmeal Porridge also Chocolate (breakfast drink)? By so doing you will greatly oblige a

Six Miles, Ala. "NEW SUBSCRIBER."

ANS.—Put one pint of water into a stew-pan over the fire and as it boils, dredge in two small tablespoonfuls of oatmeal with your left hand stirring with the right; boil slowly from twenty to thirty minutes, stirring almost constantly. When made turn into a soup-plate and add salt, sugar or spice to taste; have heated one-half pint of new milk which should be added to the porridge as it is eaten.

Chocolate.

To each quart of new milk, or half milk and water, allow three heaping tablespoonfuls of scraped chocolate. It is best to set a coffee-pot, or any convenient dish, into a kettle of boiling water; pour in the milk and as it heats add the chocolate mixed to a paste with a little milk; boil for two or three minutes and serve. Some prefer to boil chocolate only one minute, others fifteen, while others boil it one hour, setting aside to cool that the oil may be removed and then reheating when wanted.

CAN'T some of the farmers' wives give us more recipes in which *buttermilk* is used?

Norfolk, Conn. L. P. STEVENS.

Queries Answered.

Will you please to tell me what will remove white paint from a black silk, after it has become hard? S. Mc. C.

ANS.—Chloroform is excellent for the removal of dry paint from all sorts of clothing. Portions of dry white paint which resist the action of ether, turpentine, or alcohol are at once dissolved by chloroform.

Please tell me if there is any thing I can mix with tallow which will harden my candles?

YOUNG HOUSEWIFE.

ANS.—Allow one pound of alum for every five pounds of tallow. Dissolve the alum in a kettle with a little water, add the tallow and stir until melted together, then run into molds the usual way. This makes a candle as hard and white as wax—that is if the tallow is pure. Another way is to add to each pound of tallow one-fourth pound of common rosin and melt together. This last, although an improvement upon the common tallow candle in hardness and lighting power, is not in color.

Is there anything that will remove iodine stains from bed-linen? W. E. P.

ANS.—Apply rectified spirits.

How shall I cleanse chamois leather so that it will be soft after the process? EMMA B.

ANS—Dissolve a piece of borax, the size of a hickory-nut, in sufficient *warm* water to wash the chamois. Use good hard soap and rub the leather well with the hands in every part. Wash in this way in two, and if the chamois is very soiled, in three or four waters, rinsing at last in clear, warm water in which a piece of borax has been dissolved, the same as before. Squeeze out but do not wring, snap, stretch slightly and hang before the fire. As it dries, stretch from time to time—this last is important.

Entomological.

SLITTING BARK.

DEAR MR. MANN:—"Have you had any experience in slitting the bark of trees that are hide-bound? Do you know of any entomological reason against it?" ED. RURAL.

In the twenty-fourth annual report of the Secretary of the Massachusetts Board of Agriculture for 1876, p. 33, the term "hide-bound" is applied to the checking of the circulation in the stem of a tree, and your correspondents,—Prof. BEAL and Mr. T. T. LYON, on p. 44 and 71 of the present volume of the RURAL NEW-YORKER, seem to have a similar understanding of the term; namely that the trouble comes from the root. If the trouble is not caused by the tightness of the bark, then, of course, there is no occasion for relieving that tightness. The question is only whether the trouble is caused by tightness. As this condition of tightness is natural and inevitable in all trees, it is difficult to understand why it should be looked upon as a disease or a condition requiring treatment.

As to cutting the bark lengthwise, to give the wood more room for expansion, it does not seem, after President CLARK'S experiment on the squash, that we need to trouble ourselves about the ability of the wood to break its way out when it is ready. I do not know that, botanically, there would be any perceptible injury to the tree from this operation, for it is stated in the volume for 1874 of the Reports above mentioned, p. 239, that the separation "of the bark from the wood by the combined action of frost and sunshine is not uncommon in the apple and other cultivated trees. If a severe frost separate the water from the wood as ice, and it then thaws and freezes again before it can be reabsorbed, it will be likely to burst the bark or tissues in which it is accumulated. This usually results in one or more cracks through the bark on the southerly side of the tree, from which there is, in the case of the apple tree, commonly a slight flow of crude sap in the following April or May. The outside of the bark is blackened and the detached portions die."

In an earlier part of the same Report for 1874, p. 531, an account is given of an experiment showing that one eighty-fourth of the natural amount of wood was sufficient to supply nourishment to the whole natural amount of foliage of a Hibiscus, for the period during which the experiment lasted; and in other parts of the treatise from which these extracts are taken, it is shown that considerable mutilations of bark can be repaired by the plants experimented upon.

I do not know whether there are any fungi which would attack the wounds in the tree, but there are certainly some insects that would pounce eagerly upon any such wound and find lodgment therein.

The Plum curculio (Conotrachelus Nenuphar) comes forth from its winter retreat sometimes as early as the 30th of March, and different individuals are engaged in the deposition of eggs from the middle of April until the end of July. Naturally they deposit their eggs in fruit of various kinds, but although not the cause of the "black-knot" of plum, cherry and other trees, these beetles sometimes breed in the "knot" and would be likely to deposit their eggs in any wounds of the bark of these trees, where they would breed unobserved.

The Apple Buprestis (Buprestis fomorata) becomes a perfect insect at the last week of May and contrives during June and the forepart of July to lay her eggs upon the bark of the trees, especially "where the bark had previously been killed from some cause, and almost invariably according to report made to Dr. FITCH, on the south side of the trees."

The Apple Saperda (Saperda bivittata) makes its appearance, every year, early in June. In the course of June and July she lays her eggs, one in a place, upon the bark, low down, at or very "near the surface of the earth;" or "when these beetles are numerous, some of their eggs are placed higher up, particularly in the axils where the lower limbs proceed from the trunk." As soon as the eggs hatch the grubs begin to feed on the inside of the bark.

The Woolly Apple-louse (Eriosoma lanigera) sucks the sap of the bark and of the young wood immediately under the bark from spring through summer until late in the fall or even in winter. It lodges in crevices of the bark and causes warts to grow there, making the tree diseased and finally killing it.

I have found also under the bark of apple-trees what seem to be the caterpillars of the pear-tree borer (Ægeria pyri,) which becomes a moth in the autumn, and lays her eggs again on the bark.

Thus it may be seen that at no time of the year can the bark be wounded without thereby becoming more readily subject to the attack of important destructive insects. Yours,

B. PICKMAN MANN.

(For other Queries see page 176.)

Miscellaneous.

PLEASE answer the following questions through the columns of your valuable paper:

(1). I have a Black Walnut and Maple floor in my dining-room. Can you tell me how to wax it? (2). Explain the process of obtaining spring wheat. Is it obtained by sowing winter wheat in the spring? (3). Are eggs from pullets as good for incubating as others? MRS. S. W. C.

(1). Cut into small bits six and one-quarter pounds of yellow wax and stir into a hot solution of three pounds of pearl-ash in rain-water. Stir constantly while boiling. The mixture is at first quiet, but soon commences to effervesce. As soon as this ceases, add three pounds of dry yellow ochre and pour into tin cans. When wanted for use, melt one pound of the mixture in two and one-half quarts of boiling water and apply while hot to the floor with a paint-brush. This will dry in a few hours, after which the floor should be polished with a large floor brush and then rubbed with a woolen cloth.

(2). There is no difference between spring and winter wheats except by cultivation. The one is converted into the other by successive sowings in spring or fall.

(3). There is no difference that we are aware of.

Varieties of Pelargoniums.

L. S. W.—Please name inclosed Geranium and oblige

ANS.—It is a Zonal Pelargonium—not a Geranium. There are perhaps a thousand varieties like the one you inclose, with differences so slight that it would be difficult to tell one from the other unless compared together. Hundreds are named one year to be forgotten the next.

WHAT THEY SAY OF IT.

THIRD ACKNOWLEDGMENTS.

STILL ALL THINK IT "SPLENDID."

[THE letters we have received from those who have earned RURAL "Cricket" Clocks, are very gratifying indeed. In the crowded state of our columns this week, we cannot find space for all that we would be pleased to publish. We beg to state that fifteen cents forwarded to us will prepay expressage. Twenty-five cents may be charged by the express companies if collected on delivery.—EDS.]

MY LITTLE FRIEND.

My pet has but two little feet,
And yet he runs all day,
As merrily and tirelessly
As if it all were play.

He chirps away a lively song
To cheer my every task.
And he is wise, my little friend,
And tells me all I ask.

That he is *lettered* one could tell
By looking at his *face*,
And all his *works* are widely known
For nicety and grace.

And yet he shows no pride, because
Of his most favored *case*,
But ever holds his slender *hands*
Before his modest *face*.

I thank the RURAL publishers,
Who sent this friend to me;
May willing *hands* reward their *works*,
Their *time* pass merrily!

Painesville, O. MINNIE D. B.

THE "Cricket" was received by express, all right. When I took it out of the box, the children exclaimed, "Oh, it is a silver clock!" It couldn't be a prettier ornament for my parlor mantle-piece if it were solid silver. We have had it now five days, and in that time it has neither gained nor lost one minute. The old pendulum-regulator has been deposed, and we now regulate our household by the "Cricket." Mr. T—— informed me he had sent you two names and had ordered the "Cricket" for himself, but thought it must be some no-account, cheap contrivance, or you could not offer it so liberally. I showed him mine, and all he wants to know now is, "How you do it?"

Boonville, Mo. S. C. H.

THE premium received. The RURAL "Cricket" chirps cheerfully, not on the hearth, but on the nail, and its handsome presence is a constant reminder of a large reward for a small service. It chirps and keeps time with those clocks for which we have paid five and ten dollars. It is a charm, an ornament, and a convenience to the whole family. J. B.

Annville, Lebanon Co., Pa., March 3, 1878.

I AM in receipt of your beautiful premium, the "Cricket." I am free to confess that I felt it was possible that your offer was in too glowing terms; but a glance at the beautiful and substantial time-piece, has convinced me of my error. I submitted mine to a practical clock-maker, and he pronounced it a marvel of beauty and simplicity. Accept my warmest thanks.

EDMUND Y.

Brantford, Ont., March 5, 1878.

THE "Cricket" Clock received all right. Has proved to be a good time-keeper, running in any position; and it is certainly worth double the amount you charge for it and the RURAL together, to any one having any use for a timepiece.

Waterford, Va., March 4, 1878. J. H. [illegible]

WE have been very much disgusted with some premiums we have received for newspaper work. We tell you frankly, the "Cricket" Clock is a true, a liberal reward for our two names, and we shall do all we can for the RURAL NEW-YORKER.

Hempstead, N. Y. A. M. S.

OUR Clock was at the Express office when I wrote you that we had not received it. It is a *Gem*, as you represent it, and we are altogether satisfied. M. A. B.

Detroit, Mich., March 6.

YOUR Clock received by Express. It is all right, seems to keep good time, and we thank you. P.

Cincinnati, Ohio, March 5.

WE value our "Cricket" Clock highly. It keeps good time and can be regulated, no doubt, to keep exact time. It is all you say of it, and you may publish this as my honest sentiment.

Akron, Ohio. M. S. M.

IT is the prettiest clock I have ever seen. You are very good.

Jackson, Mich. C. M.

MY daughter is much pleased with the "Cricket." It goes well. M. B. B.

THE SYRACUSE CHILLED PLOW

It is Lighter of Draft, More Perfect in Shape, More Durable in Wear, Does Better Work in the Field, Has Less Breakages in its Different Parts, than any other Plow made in this Country or Europe.

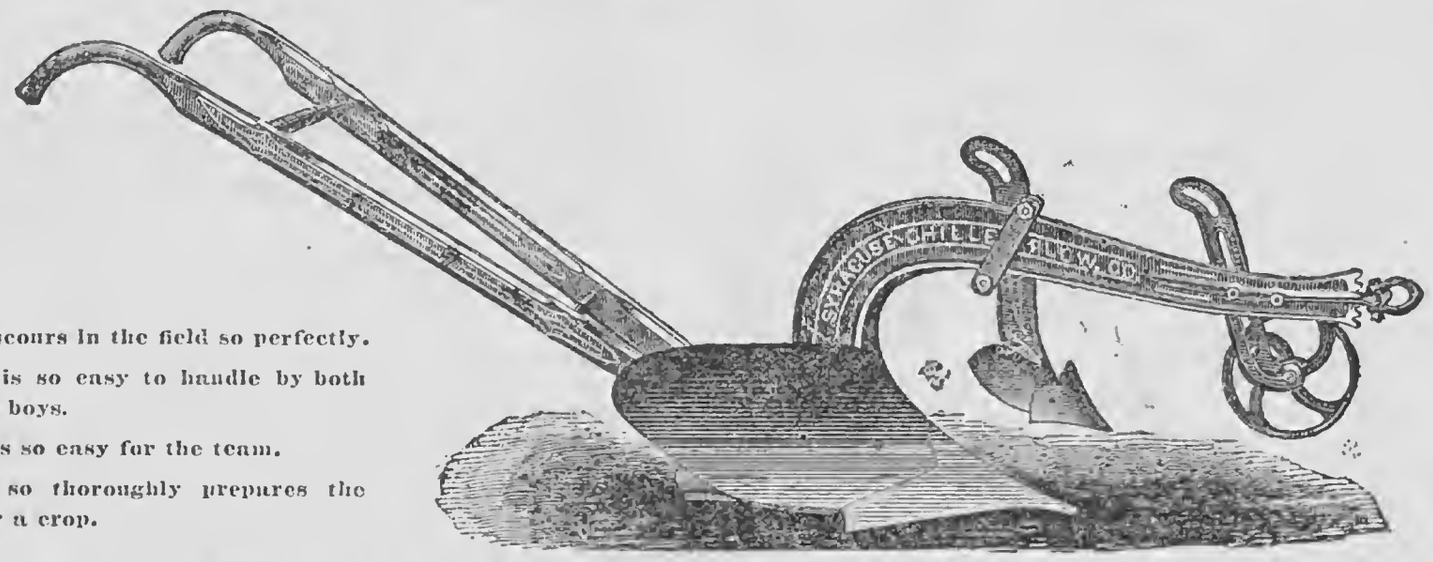
Perfect Workmanship, Perfect Material, Perfect Patterns, Perfect Plows.

☞ No Plow scours in the field so perfectly.

☞ No Plow is so easy to handle by both men and boys.

☞ No Plow is so easy for the team.

☞ No Plow so thoroughly prepares the earth for a crop.



More of these Plows Sold in the State of New York in 1877, than of all others Combined.

Thousands of farmers, the past year, who have tried all the other kinds of so-called Chilled Plows, have cast them aside for the Syracuse Chilled Plow.

Eighteen months have elapsed since we commenced at Syracuse, N. Y., the manufacture of CHILLED PLOWS. In that time we have demonstrated:

FIRST—That they are a more durable Plow than any other in use.
SECOND—That they will clean in any soil superior to the best tempered Steel Plows.
THIRD—That they possess the like superiority over any Cast Iron Plow, and that their draft is twenty-five per cent. less.
FOURTH—That their price is considerably less than that of the Steel Plow, or any other Plow which is really a Chilled Plow.

The great success of this Plow has induced other manufacturers to come into the market with Plows that they claim are chilled. Some of these claim that their *chill* consists in a combination of metals, producing the requisite hardness, while one or two boldly assert that their *chill* is produced in the process of manufacture. The truth is that there is no other so-called Chilled Plow in market that is made by a process bearing any resemblance to that by which the SYRACUSE CHILLED PLOWS are made, nor can such Plows be made by any combination of metals whatever, nor can a genuine Chilled Plow be sold at a less price. The process of manufacture will not admit of it, and whenever a Plow is offered at a less price, the purchaser can be assured that it is not a genuine Chilled Plow.

Annexed will be found a few out of hundreds of recommendations of these Plows that have been received by the manufacturers.

This Plow received the highest award of merit at State Fair Albany, 1876, and Rochester, 1877, Western New York Fair, Rochester, 1876, Central New York Fair, Utica, 1876. It has also been uniformly successful in over one hundred competitive trials since the fall of 1876, at County and Town Fairs and Plowing Matches.

☞ Every Plow is warranted to give satisfaction, and we warrant our Beams, Mold Boards, Landsides, Wheels and Jointer Standards against breakage from any flaw or defect in manufacture, during the current year.

Some unprincipled manufacturers are palming upon the community a most inferior kind of Extras, claiming that they are as good as those made by us; while the truth is they are made of the poorest metal, and will not do one-quarter of the service that ours will do.

THE PRICES OF THESE PLOWS ARE AS FOLLOWS:

One Horse Plow, No. 0	$10.00;	Weight 70 pounds.
Two " " " 1, full rigged	16.00;	" 150 "
Two " " " 2, "	16.00;	" 140 "
Two " " " 3, "	10.00;	" 120 "
Three " " "10, "	18.00;	" 170 "

A "full rigged Plow is one that has two Plow Points, two Jointer Points, one Clevis, one Wheel, one Malleable Wrench, one Jointer and one Band.

CLAY, N. Y., Sept. 25, 1876.

GENTS:—I have been using a Steel Plow of about one-half of the weight of your Plow, but it draws at least one-third heavier. I have used various plows in my experience in farming, and can state without hesitation that the Syracuse Chilled Plow is the best I have ever used, or seen used.

GEORGE HAMLIN.

BROADALBIN, N. Y., Oct. 22, 1876.

GENTS:—I have plowed with one of your Plows on a farm where a Steel Plow would not clear, but your Plow worked to a charm, clearing every foot of the way. Yours, truly, ISAIAH BETTS.

CLINTON, Dutchess Co., N. Y., Oct. 23, 1876.

DEAR SIRS:—We tried your Chilled Plow last fall. It will be useless for us to relate to you the working of this Plow. In the first place we cannot extol it enough. It is far ahead of anything we ever used.
Yours, truly, BROOKS & LENARD HAIGHT.

CANANDAIGUA, N. Y., Oct. 1, 1876.

GENTS:—I took one of your Plows on trial with those of other manufacturers, who claimed superior merits, and among them was included a Western Plow. I gave each of them a fair trial, and have no hesitation in pronouncing your Plow superior to them all in many respects. It holds easier, cleans perfectly and holds to the ground, and runs steadily where the other Plows would not. I cheerfully recommend it as superior to any I have ever used.
Yours, M. D. MUNGER.

WASHINGTON HOLLOW,
Dutchess Co., Oct, 10, 1875.

SIRS:—I have used the Chilled Plow made at Syracuse, and am fully satisfied that it does better work, and in every respect surpasses any plow that I have ever used. Yours, truly, MILTON HAM.

HIBERNIA, Dutchess Co., Nov. 23, 1876.

GENTS—I have given the Chilled Plow I purchased of you a thorough trial, and it gives me pleasure to recommend it as the best plow I ever used. I have used many kinds of plows for the last thirty years, and for five years made many kinds of plows. I am confident that for ease to the team and the holder, for the amount of work it does in a given time, and the condition it leaves the land plowed, your Chilled Plow is far superior to any plow now in use.
Yours, truly, ISAAC LAWTON.

LOCKPORT, Sept. 25, 1876.

I HAVE used Plows more or less for forty-five years and now have four of your Plows on my farm, which I would not part with for four times their cost, if I could not buy the same again. I advise my farmer friends to buy them, for I know they will please them. They wear well; their draft is light, they do their work well, and they will scour in any soil. Yours, respectfully, J. R. HILL.

WASHINGTON, Dutchess Co., Oct. 28, 1876.

DEAR SIRS:—I have used your Plow to plow twenty acres, and I find that the Syracuse Chilled Plow is the best for all kinds of ground, that I ever used. I think I can plow much more ground in the same time and one-third easier than with any other plow.
Respectfully yours, J. H. LOSEE.

POUGHKEEPSIE,
Dutchess Co., N. Y., Oct. 25, 1876.

IT gives me much pleasure to say I find the Syracuse Chilled Plow far superior to any other. I was plowing a swamp that consisted of several kinds of soil. Had it not been for your Plow it would have been turned over in bad condition. It cleans perfectly in mucky soil.
Yours, truly, JOHN FITCHETT.

PLEASANT VALLEY, Dutchess Co., Oct. 30, 1876.

GENTS:—We bought two of your Plows in the fall of 1876, and we can say, for all kinds of work, they have no equal in this country. They will turn a furrow up hill far superior to any plow I ever used. The draft is evidently light. Respectfully yours,
THEODORE & HERMAN HICKS.

POUGHKEEPSIE,
Dutchess Co., N. Y., Nov. 29, 1876.

DEAR SIRS:—I bought one of your Chilled Plows this fall, and tried it in sod that was paved with stone; it hung to the ground well, and did its work better than any plow I ever used.
Yours, truly, WM. E. BADGLEY.

POUGHKEEPSIE,
Dutchess Co., N. Y., Nov. 25, 1876.

GENTS:—It gives me much pleasure to recommend your Chilled Plows. I have used one of them this fall, and can say they are better than any plow I have ever tried in an experience of thirty years of cultivation of the soil. It cleans perfectly wherever I have used it, and is of a lighter draft, and easier to hold than any plow I ever used.
Yours, truly, JOHN WING.

NEW CANAAN, Conn., Dec. 1, 1876.

GENTS:—Your Plows give great satisfaction. They do the work well even in our rough, stony soil, and took the First Premium this fall at the Fairfield County Fair. Yours, J. F. SILLIMAN.

BETHLEHEM CENTER, Jan. 20, 1877.

SIRS:—I have thoroughly tested the Syracuse Chilled Plow, taken on trial, and am so well pleased with its use on all kinds of soil, that I would not do without it. Several of my neighbors have borrowed it, and without exception pronounce it perfect. It leaves the ground in better condition than the Collins or Adamantine, and entirely does away with the use of the Wheel Cultivator in preparing the soil for sowing or planting. Yours, D. P. SIMMONS.

WASHINGTON,
Dutchess Co., N. Y., Nov. 17, 1876.

SIRS:—I bought one of your Chilled Plows this fall and find it as recommended. I can plow one-fourth more land than with any plow in this vicinity. The draft is lighter than those I have been using. LEWIS D. GESMOND.

NEW HAVEN, N. Y., Jan. 23, 1877.

GENTLEMEN:—I have been engaged in agricultural pursuits quite extensively for the last fifteen years, during which time I have had in use ten plows of different manufactures, including one of your Chilled with the Jointer Attachment, and can testify that to the best of my judgment the Plow I got of you can do a greater amount and more perfect work in the same length of time than any other that I have had experience with, and with less draft power.
Yours, etc., HENRY J. DAGGETT.

KEELER BAY, Vermont, Nov. 1, 1876.

GENTS:—I have had three of your Plows this season. Two of them have been tried and they work nicely. I have been wanting to find the Plow for a long time. Your Plows please me.
Yours, respectfully, H. HARRINGTON.

MARSHALL, Mich., Nov. 7, 1876.

SIRS:—To-day being Election day, I had an opportunity to exhibit and test your Plow in the presence of a large number of farmers. The field in which it was tried was a timothy sod. The Plow did its work well and gave great satisfaction.
Yours CHARLES H. MANN.

ENFIELD R, N. Y., Nov. 10, 1876.

GENTS:—Your Plow proves itself worthy of your recommendation. It took the first prize at our County Fair. Yours, S. V. GRAHAM.

NEW SCOTLAND, N. Y., Feb. 2, 1877.

SIRS:—I have used various plows in my experience of twenty-five years in farming, and can say without hesitation that the Syracuse Chilled Plow is the best I ever used, it working equally as well in sod as in stubble, leaving the soil in better condition for the crop than any plow I ever saw used.
Yours, E. CRAWFORD.

WHITEHALL, N. Y., Jan. 20, 1877.

THE Syracuse Chilled Plow I took of you on trial last fall, proved to be the best Plow that I ever had on my farm. It works the best of any Plow I have ever used. Truly yours, SAMUEL BENJAMIN.

DARIEN, Aug. 4, 1877.

GENTS:—I tried four different plows this spring, and found your Chilled Plow to be superior to them all,—they are fast coming into use in this section.
S. YATES.

ALBANY, Jan. 23, 1877.

SIRS:—I can with pleasure recommend the Syracuse Chilled Plow to be all that you claim for it. It cleans perfectly and leaves the ground in the very best condition, and I consider it a Plow of the highest excellence. I have not been hitherto favorably disposed toward Iron Beam Plows, but I like the one I have so well that I shall buy another the coming season. Yours, very respectfully, L. J. GOVE.

PEMBROKE, May 11, 1877.

GENTS:—I have bought and used one of your Chilled Plows, and find it will clean in any soil on my farm. It is lighter in draft and better than any plow I have ever used.
Respectfully yours, W. M. JOSLIN.

DARIEN, Genesee Co., N. Y., May 10, 1877.

I BOUGHT this spring one of your Plows and can say I have never seen its equal in an experience of twenty-five years' farming. It suits me in every particular. JOHN RICHLEY.

WEST BATAVIA,
Genesee Co., N. Y., April 21, 1877.

I HAVE used the Syracuse Chilled Plow and am fully satisfied that it does better work and in every respect surpasses any plow that I have ever used.
J. L. LOWN.

PEMBROKE, N. Y., May 17, 1877.

I HAVE used all the different kinds of Plows for the last thirty years, and unhesitatingly say that the Syracuse Chilled Plow is the best I ever used, or saw used, and would recommend it as superior to all others. WILLIAM H. CLEVELAND.

WEST BATAVIA, Aug. 6, 1877.

GENTS:—I took one of your Plows on trial this spring and find it all you recommended it to be.
A. HARTSHORN.

ALEXANDER, N. Y., May 21, 1877.

I HAVE this day tested and bought the Syracuse Chilled Plow, and unhesitatingly say I have never seen its equal for lightness of draft, workmanship, and ease of handling; and holding to the ground when dry and hard. Of its clearing qualities I have no doubt. GEORGE B. PARISH.

BATAVIA, Aug. 20, 1877.

GENTS;—I was plowing oat stubble, and my plow clogging very badly. Your agent drove into my lot and insisted on my trying one of your Plows. I did so and found it would plow my ground without clogging. I bought it, and would not part with it at any price if I could not replace it.
Yours, respectfully, PATRICK DUANE.

BATAVIA, N. Y., Aug. 13, 1877.

GENTS:—Your Plow proves itself worthy of your recommendation. H. UPHILL,
WM. S. LEAR.

A FEW WORDS IN REGARD TO THE USE OF THE JOINTER.

Farmers sometimes say that they do not care for the Jointer and desire to purchase a Plow without one. This is a great mistake on their part, and no farmer who has once used a Jointer will give up its use for any consideration.

The Jointer Standard should be set nearly perpendicular, and arranged to cut a furrow slice not over two inches deep. This furrow slice will be turned over in the bottom of the furrow, and the mold board of the plow will then turn its furrow over upon top of it, completely burying with it all the weeds, manure, clover stubble, sod, etc., turned under, out of sight, and the top of the ground will be left even and light. In sod, the ground once plowed in this way is light and mellow and the harrow will not drag up the turf.

Wherever a colter will work, the Jointer will work, and do all that the colter can do, and much more effectually. When the Jointer Point needs replacing the farmer can replace it by loosening one bolt, with a new point that will cost him but twenty-five cents. This is a great saving over the time and expense required to re-face and sharpen a colter.

With every Plow an additional Jointer Point is furnished free of charge. These points are made of the best iron and hardened, and they are very durable.

☞ **SPECIAL OFFER.**—For the purpose of introducing our Plows in sections where no agencies have been established, we will send any one of the foregoing styles, free of freight, to any Railroad Station in the Eastern and Middle States, on receipt of the price thereof, as above stated. This offer to be open for thirty days.

All communications to be addressed to the

SYRACUSE, N. Y., March 12, 1878.

CLOUD LAND.

Fools' Paradise, where the rich soil yields a generous harvest with just enough tillage to serve as a pastime; where profitable markets are always at hand liberal of reward to pleasurable effort; where the weather can be had to order and health instead of disease is catching; where the neighbors are all delightful, and ignorance, uncouthness and turbulence are unknown; where sucking pigs, baked an appetizing brown and impaled with convenient knives and forks, trot briskly around delighted to afford a slice of hot pork and savory crackling at a moment's notice, and where all other viands and grateful beverages are equally handy, is a place which many emigrants, all the world over, are restlessly in search of. 'Tis the only spot, even in dreamland, where Adam's descendants are exempt from the hereditary penalty imposed on Adam's transgression—that in the sweat of their brows he and his children should earn their bread.

Among the myriad toilers of other countries there is a vague notion that this delectable locality, or at least a region approaching it in attractiveness, can be readily stumbled upon within the broad bounds of "The Land of the Free and the Home of the Brave," while the inhabitants of this favored country, despairing of finding this elysium among the struggling crowds around them, seem, many of them, to imagine they can hit upon, or soon create, a fac-simile of it, somewhere in the sparsely settled wilderness along our civilized frontier. A search for it there, however, would be as vain as Ponce de Leon's pursuit of that sparkling treasure of Fools' Paradise, the Fountain of Youth. Indeed it would be well for all about to emigrate, especially farmers, to bear in mind that success in a new location will inevitably necessitate cautiously prudent selection, an energetic spirit, and, at least at the outset, an increase of labor, privation and hardship. Nor would it be unwise to reflect whether the voluntary practice of these requisites among the friends and scenes endeared by familiarity, would not be likely to win as fair a measure of future prosperity as could be reasonably expected from their compulsory endurance amid the miseries inseparable from the condition of a stranger in a strange land.

HAVE WOMEN BUSINESS ABILITY?

A few weeks ago, in one of the comfortable sleeping coaches which have so reduced the weariness of travel, we left Boston on a train bound outward for the West. There were not more than half a dozen persons beside ourselves in the car, and this scarcity of travelers made conversation general, and established friendly and social relations between people who had never seen each other before, and did not, even then, know each other's names.

In the section just behind ours, four gentlemen had seated themselves, and were talking concerning matters of general and sometimes local interest.

Occupied with a book, we gave little heed to their conversation until our attention was suddenly arrested by hearing one of them exclaim, with much emphasis, "Yes, sir! I believe that, as a rule, women are more economical than men. You see, woman can't *waste* much money if she tries; she's obliged to spend it on herself, on her jewels and laces, her silks and satins and furbelows of one kind and another. All these, however, can be turned into money again; and the more ragged and dirty and dingy a piece of lace is, the better a woman likes it, and the more money it will bring. But now just look at the men, and think for a moment of the enormous sums of money spent every year on fast horses, gambling, wines and tobacco; things that represent not capital invested, but capital sunk, wasted. Why, if a man sets about it, he can waste more money in one year than a woman can spend in five."

"I guess you're right," assented his neighbor; and—" dropping his voice to a low tone and speaking slowly, as though he were about to tell something which, though true, was entirely beyond his comprehension—"I'll bet a copper that my wife can tell exactly how much money she has had in the last ten years, and just what every cent was used for."

"How about yourself," asked number three, "can you do the same?"

"Not much!" was the emphatic answer. "I've had a good many attacks of book-keeping in my time, but I get over them in just about four days. By that time the thing won't balance, and I give it up."

A hearty laugh followed this frank confession, and then a lady who sat by the opposite window turned and said, with a half smile, "And yet, I suppose that if any one were to ask you if your wife has any business ability, you would say no?"

"Well, ma'am, I suppose I should. We men don't generally reckon on a woman's having much business ability; but I'm not sure they haven't got it in spite of us."

Here the conversation drifted into other channels, but it started a train of thought in our own mind and may perhaps do the same for some of our readers.

Do we not all know women, who, with inadequate means at their command, have struggled for years against trials difficulties and obstacles, which, to the more timid, seemed simply appalling? Women who have made home pleasant and attractive to their children; who, by the exercise of qualities which would have made good business men of them, had they been men instead of women, have given these children education and accomplishments.

These women are sagacious; quick to see where their interests lie, and always ready to avail themselves of fortunate circumstances. Upright and conscientious in all their dealings, they are not forgetful of the fact that the world owes them place and station and recognition. Respecting themselves, they are respected by others, and have the confidence of all who know them.

There is an adjective peculiarly American in its significance, and of the widest comprehensiveness which people apply to such women. They are *smart*. A woman who manages her household affairs with such prudence, foresight and economy as to excite the admiration of her neighbors; who is always neat in appearance though she may not possess any fine clothes; who, though a hard worker, finds time to read and thus enlarge the horizon of her otherwise narrow world, is invariably spoken of as a "smart woman."

She is not a business woman because her smartness has never been turned in that direction; but that she has the ability to carry on business, we do not for a moment doubt.

She could not do it at once, of course; any more than a man could do her work put into her place. But she would soon learn.

We are not to be understood as discussing the advisability of women engaging in business affairs which are usually conducted by men. We are simply entering a protest against the remark one hears too frequently, "what are women good for in business?"

FRAMES FOR PLANTS.

In the crowded state of our columns, we may be excused from furnishing minute directions as to the construction of hot-beds and cold-frames, especially as now-a-days this information is given in most of the seed and plant catalogues issued by our seedsmen and nurserymen, with every needed detail. Cold-frames are of much value, and within the reach of all. Dig a square or a rectangular hole in a well-drained part of the garden, a foot deep, and place therein a box made higher behind than in front, or towards the south or southeast. Fill this in with light, rich soil, and sow the seeds. Now a hot-bed differs from a cold-frame in that it rests upon a foot or more of decomposing manure, which generates heat underneath the soil, while the cold-frame receives heat only from the sun's rays. The latter should, therefore, be uncovered in the morning as soon as the sun becomes warm enough upon it, and again covered as soon as it begins to lose its warmth in the afternoon, so that all the heat possible may be retained until the next day. The sides of the frame, which should extend a few inches above the earth about it, sufficiently protect the young plants from strong winds, or a shelter of any kind may be placed on the side whence the wind comes. When the principle of these useful arrangements is understood, a very little ingenuity serves to provide them, and to work them with success.

NOTES.

Respecting the Rural.—In deference to other advertisers, we are obliged this week to omit our advertisement of the Rural "Cricket" Clock, which has created a little *furor* among our friends which we had scarcely anticipated. Quite a number, however, have not quite understood our offer, and we will here endeavor to make it plain. The lowest price of the Rural New-Yorker as is well known, except in clubs, is $2.50 per year; for two subscribers it is $5.00. The retail price of the clock will probably be fixed at $3.00—together making $8.00. Now to anybody sending us two new subscribers and $5.00, we will present the "Cricket" Clock. Or it will be presented to anybody forwarding us one subscription and $3.50, instead of $2.50, as for the Rural alone. We have made arrangements with the express companies by which those preferring to prepay may do so by forwarding us 15 cents.

We are encouraged to believe that those who choose to avail themselves of our offers, will find, ere the year closes, that they will have received a fair equivalent for the price of subscription, without taking into the account the value—whatever that may prove to be—of the Rural itself. At least, we have a very earnest desire to do all we can without actual loss to ourselves.

Grape-Vines.—The advice generally given to those intending to plant Grape-vines is, "Select the Concord, because it thrives almost everywhere." If it is intended to plant but one vine, the advice is good, no doubt; but if more, we advise our friends to select many of the best varieties at present known. It will generally be found that a large proportion will live and bear fruit. The minority that fail can be replaced by others as soon as the failure is ascertained, and the loss will be more than compensated by the pleasure of having many kinds, of different flavor, color, and time of ripening.

The Objection Removed.—Many first-rate authorities advocate the use of whitewash upon fruit trees. Several are convinced that it will prevent and even cure pear-blight. But many object to whitewashing trees because it renders them unsightly. This need not be. A certain quantity of lamp-black and red mineral paint-powder may be mixed with the whitewash, imitating the color of the bark so closely that it is not apparent to the casual observer that the trees have been washed at all.

BREVITIES.

One intuitively begins to think about planting strawberries. The garden without strawberries is a breakfast without coffee.

The Herald would do well to give more attention to our weather reports and less to those of England.

Baked Beets.—Whoever heard of baked beets? It is said the Egyptians use them cooked only in this way. Why not try baked beets?

When Mr. Meehan hears a man remark that the beautifying of homes is only the indulgence of a pride, he sometimes doubts whether such a man is human.

If our income is six cents per day, we should save one cent. That is equivalent to saving one-sixth of our time, which in one year amounts to about sixty days—a solid nest-egg for a rainy day or upon which to start anew.

In answer to many questions—What varieties of strawberries shall I buy?—we answer as for grapes: As many as you can afford to buy, and you will then be enabled another season to answer the question better than any other person can answer for you. We believe that such experiments cost less, generally, than taking the advice of others.

Mr. Hiller, of Lancaster, Co., Pa., stated at the last convention of the Pennsylvania Fruit Growers Society, that of 150 standard pears which he planted twenty years ago, twenty per cent. have perished by blight. Mr. Meehan remarked that he never noticed blight where trees were whitewashed. Mr. Saunders believes whitewashing an absolute remedy.

April is full time in this climate to sow seeds of Asparagus. Thin out the plants to four inches in the rows, reserving only the strongest. Set out one-year-old plants at least one and a half foot deep in sandy, light soil that has been highly enriched. For family use, make plots five or six feet wide, four rows to each, allowing a foot in the row and set the plants six inches or more deep.

There are many who do not greatly relish blackberries. But this need not deter them from raising all they can find room for, since blackberry wine is of much value for medicinal purposes, and its value increases with age. Mr. Parry's recipe for a gallon is: "Add three pounds of sugar to three quarts of blackberries and a little water." The Kittatinny is still the best variety for this if not for every climate where this fruit thrives.

Rural Grounds, March 11.—Yesterday (Sunday) was here a May day. Many plants are breaking into leaf—such as Honeysuckles, Hypericums, Spiræa sorbifolia—and Strawberry plants are pushing through their covering, as if impatient of longer restraint; Grass is green and fresh in sheltered spots; many Maples are in bloom. Horsechestnut buds are swelling and altogether we entertain serious fears that a cold snap, which we can yet scarcely hope to escape, will effect much harm. The thoughtful farmer or horticulturist will, however, avail himself of such opportunities to do everything that can be done to simplify or to promote spring work.

We regret that advertising favors, aggregating more than one hundred lines, are left out of this issue. As it is, we encroach upon the space devoted to reading matter to an extent that urges us also to apologize to our readers. However, we may truthfully say to these last that our advertising columns this issue will prove most interesting reading. In them will be found answers to scores of questions that are sent us weekly for insertion in our question and answer columns. We are gratified to be able to present the announcements of most of the representative manufacturers of the country who cater to the special wants of the class that mainly compose our circulation. We think there will be a reciprocity of gain, if advertisers and readers come together.

Competition is a good thing if it makes business men more active and reduces the cost of the necessities of life. There is much that is suggestive in the old adage that "a nimble sixpence is better than a slow shilling." When competition takes the shape of overdoing business, and on the principle that all must live, exhorbitant charges are imposed to make up for limited sales, then the sooner competition which creates such a condition in business, is lessened, the better. A benevolent physician says that gratuitious visits to the poor are often for naught because they cannot afford to buy the medicines he prescribes on account of the excessive rates charged. Are there not too many druggists?

Nature's Darlings?—As in the moral so in the physical world, seeds beneficial to our race, have, as a rule, to be carefully protected from injury and destruction, while those inimical to humanity, disregarded by man, seem to have become the special proteges of Nature. A forcible illustration of their extraordinary vitality has lately been afforded by experiments made by Dr. Klien, President of the Kingsberg Versuch Station, on the waste matter from oil cake. One sample of rape-cake he examined contained seeds of weeds to the number of 2,250,000 in a cwt. These had passed through the process of manufacture without having been in any way crushed or having had their germinative powers destroyed, and, moreover, the Doctor detected them uninjured in the dung of cattle fed upon the cake. Are not weeds then Nature's darlings?

Literary Miscellany.

IF I SHOULD DIE TO-NIGHT.

If I should die to-night,
My friends would look upon my quiet face
Before they laid it in its final resting-place,
And deem that death had left it almost fair;
And laying snow-white flowers against my hair,
Would smooth it down with tearful tenderness,
And fold my hands with lingering caress;
Poor hands, so empty and so cold to-night.

If I should die to-night,
My friends would call to mind, with loving thought,
Some kindly deed the icy hand had wrought;
Some gentle words the frozen lips had said;
Errands upon which the willing feet had sped;
The memory of my selfishness and pride,
My hasty words would all be put aside,
And so I should be loved and mourned to-night.

If I should die to-night,
Even hearts estranged would turn once more to me,
Recalling other days remorsefully;
The eye that chilled me with averted glance,
Would look upon me as of yore, perchance,
And soften in the old familiar way.
For who could war with dumb, unconscious clay?
So I might rest forgiven of all to-night.

O friends, I pray to-night,
Keep not your kisses for my dead, cold brow—
The way is lonely, let me feel them now.
Think gently of me; I am travel-worn;
My faltering feet are pierced with many a thorn.
Forgive, O hearts estranged; forgive, I plead!
When dreamless rest is mine, I shall not need
The tenderness for which I long to-night.

[*Exchange.*

CORA.

Harold was watching closely, but he was none the wiser for his scrutiny. Cora's manner was perfectly natural; the Viscount's showed simply the courtesy of perfect high breeding, without a touch of any deeper feeling. Harold was beginning to breathe more freely; Marianna had been mistaken after all.

They went back to the drawing-room, and the conversation which the young nobleman's ease of manner and knowledge of the world rendered so pleasant, went on uninterruptedly over the coffee. Then there was some music, Cora sang, and Lord Almare joined her at the piano. When the song was ended his lordship turned away from the piano with a stifled sigh.

"I am afraid this must the last of our pleasant evenings," he said, in a regretful tone. "I have trespassed on your hospitality too long already, Sinclair, and I am so well now, that I have not the shadow of an excuse for remaining any longer."

Harold murmured a few words of polite commonplace regrets.

"It has been a very pleasant three weeks," went on Lord Almane. "And I am inclined to be very grateful for Sultan's stumble, which gave me the pleasure of your friendship."

"You are very good," Harold said, a little coldly.

There was a silence then, which Harold was the first to break.

"You have given us the name of friends," he said, smiling. "Do we possess enough of the privilege of friends to congratulate your lordship?"

"On my recovery? Please don't; I, at least, think it a matter of regret," replied the Viscount's languid tones.

"We should do so doubly," answered Harold, courteously. "No, Lord Almane, it is not on your recovery that I congratulate you."

"On what, then?"

Lord Almane flushed a little as he put the last question, and he lifted his head with a slight gesture of surprise. Cora, with her little fingers still lingering on the keys, turned suddenly round from the piano, and glanced from one to the other.

Harold did not glance at her; but he guessed the movement, and the expression of wistful wonder and curiosity in her dark eyes.

"On your approaching marriage," replied Harold, bowing slightly. "You will not think me presuming, Lord Almane."

"Certainly not," replied the Viscount, smiling a little, while an expression of bitter annoyance passed over his handsome face. "But that auspicious event has been public so long now, that the shower of congratulations which assailed me at the time has long ceased to fall. It is not possible that you are only now aware of it?" he went on, questioningly.

"It came to my knowledge this afternoon only," answered Harold, quietly, dreading to look at his sister lest he should see the confirmation of his fears upon her face, but almost unable to refrain from doing so: "therefore, if my congratulations are tardy, they are none the less sincere, Lord Almane."

"You are very good," his lordship said, a trifle haughtily. "Will you give us something else, Miss Sinclair, if you are not tired?"

Cora had listened to the short dialogue as one in a dream. At first she fancied her ears had deceived her; but when the reality forced itself upon her, there came a sudden, sharp pang of agony, under which her face paled and her hands shook. But one moment brought pride to her help, and inexperienced as she was, and unused to control her feelings, she knew that the wound must be concealed and hidden from all eyes, most of all from the eyes of the man who had deceived her.

She did not speak, however—she dared not trust her voice to do that—but she turned to the piano again, and played a mad waltz with as much *entrain* as though she were in her wildest spirits.

"Does not that make you want a waltz, Hal?" she said, as she finished, and whirled herself round, with crimson cheeks and glittering eyes. "Should you not like one?"

"I almost think I should, little sister," said Harold, laughing, and feeling quite relieved from his anxiety about her.

Lord Almane, from his arm-chair, noted the radiant face, and understood it more correctly. He sat in utter silence without altering his position for some minutes, but as Harold took his sister's place at the piano he rose, and moved first to a window, then to Cora's side, as she sat in a low chair at some distance from the piano.

As he drew near the girl lifted her eyes to his, full of an unspoken passion and reproach.

"Do not condemn me unheard," he murmured, bending over her for a moment. "Cora, let me plead my cause with you. I cannot let you think me as guilty as I appear. Nay, I will speak. I have a right, and you must give me the opportunity."

"Must!" she answered, haughtily, rising and moving away with a queen-like gesture of offended dignity, which, while it made Lord Almane smile, increased the passion her beauty had excited.

"Yes, must," he answered, in low, impressive tones, under cover of Harold's chords, which were quite *fortissimo*. "My love for you gives me the right to insist."

Her lip curled, but the little hands were beginning to tremble. Cora's pride was failing her; and Lord Almane, seeing his advantage, pursued it.

"I claim the right," he said. "You must hear me, Cora," and his voice sank to the lowest whisper. "I love you! If I loved you less I would not stoop to plead, but loving you as I do I must justify myself. I cannot let you think of me with contempt. Cora you will hear me?"

The pleading, impassioned tones thrilled the girl, and her pride gave way.

"When? Now?" she faltered.

"Meet me to-night under the elm at the end of the garden. There is no danger of discovery," he said eagerly. Then, seeing her hesitation, he went on: "I shall have no opportunity of seeing you alone otherwise. Cora, do not be hard."

Cora hesitated; her heart urged her to accede to his request, but her loyalty to Harold made her refuse.

"No," she said, quietly; "I will not come."

He turned from her then, not with any reproach or anger, but an intense sorrow and reproach on his face, and a look in his eyes which went to her heart, so grieved and pained and yet so loving.

He went back to his seat and sat in silence, resting his head on his hands in an attitude of dejection and weariness which made Harold, as he rose from the piano, ask if his arm were painful.

"Thank you, no," replied the Viscount. "What makes you think so?"

"Your face," answered Harold, with a smile which Lord Almane returned.

"I've been a little bothered about some news from town," he said. "One cannot be exempt from trouble here below, Sinclair."

"If anyone might expect to be, you might I should think," Harold remarked, laughingly.

"You judge by appearances," answered the Viscount, half sadly. "You are strangely mistaken."

He rose as he spoke and they separated for the night; but as he held Cora's hand for a moment in his, she said, quickly, in a low tone:

"I will come."

A flash of joy lighted the handsome, weary face.

"Midnight, under the elm," he whispered, and then he released her hand, and held his own out to Harold as cordially and as heartily as though he were not trying to rob him of his greatest treasure.

It was a still, calm night, cold as most spring nights are in England, with a deep blue starlit sky overhead, a fitting vault for the solemn stillness which reigned around.

Lord Almane was pacing up and down with slow, noiseless steps, waiting for Cora, and as the half hour after midnight chimed from the neighboring church tower, he began to fear that she would not come.

"She will not come," he said; "she does not trust me fully; she will not come, and I am an idiot to care. I wonder what there is about this girl which fascinates me so strangely. I almost think I love her a little!" and then he laughed mockingly, but with an uneasy consciousness that he was not quite so indifferent as to Cora's feelings towards him as he had been on any previous similar occasion.

"She is very beautiful, he mused, "but not more so than Helen St. Maur, or that little coquette, Elise de L'Estang; and I never doubted or cared about them. What fascination can this girl exercise over me? I think I care more for winning her than I have ever done before in my life for anything. I wish she were in a different position; she would make a charming Viscountess Almane."

He smiled as he pictured to himself Cora in stately, shimmering robes, presiding at his table, with that fresh vivacity and charm of hers, or receiving his guests with that simple high-bred courtesy and grace of manner which distinguished both her and Harold.

"She would be as beautiful as a fairy queen in my mother's diamonds," he thought, as his eyes brightened and softened into tenderness over the fair picture; and he sighed a little, as he added to himself, "I wish I could afford the luxury of a penniless wife. I almost think I should commit myself."

A soft, swift footfall sounded near him; he turned quickly, and saw Cora coming rapidly towards him. He went forward a few steps to meet her, and taking her hands in his, he led her tenderly to the rustic seat under the elm tree, and gently made her sit down.

The girl's face was very white; her eyes were glittering with fear and excitement, and he felt the little hands in his tremble.

"My poor little love," he said, with an exquisite tenderness of intonation, which soothed the excited girl. "How can I thank you?"

"I am so frightened," she whispered, as she clung to him. "It is so wrong—so wicked, to deceive Harold thus."

"Nay, do not tremble my dearest, you are safe now," he said soothingly.

For a moment she sat thus, resting against him, and suffering him to hold her hands, as he murmured his tender words; then remembering she withdrew her hands, and raised herself from her reclining posture, calm and quiet, waiting for his explanation.

The Viscount sighed heavily as he saw her movement.

"You do not trust me, Cora," he said, sadly "Well, it may be that I have deserved that mistrust at your hands. You will say that I have deceived you. It may be so, but my child, I did not do it wilfully. You must remember that the fact of my engagement is so generally known, that I did not suppose for a moment that you were unaware of it."

"I am sorry you thought so basely of me," broke in Cora, passionately.

"Basely of you," he repeated. "Heaven knows how I have thought of you, my child; with what reverence and with what love."

"If it be so;" she answered, simply, "why did you deceive me so cruelly? Why did you let me love you, let me think you loved me when you were bound to another? Why did you pretend——"

"Hush!" he said passionately. "Child, you don't know your power,—your beauty—or you would not speak thus. How could I help loving you?"

Cora laughed bitterly and scornfully.

"It was easy to deceive me," she said. "I trusted you."

"Cora," he said, in the same tone of passionate pain, "you are cruel; do not add to the misery I am enduring by your reproaches."

She was silenced. The Viscount's histrionic powers were of the highest order, and he was sufficiently in earnest now to act well. He paced up and down the green sward for a minute or two, and then resumed his seat by her side.

"Do not let me waste these few precious moments," he said, sadly. "I want you to understand that if I make you suffer, Cora, I suffer ten times more, and that I would give my life to save you one pang. Was it possible not to love you when I saw you first, and you clung to me helpless, in the crowd? Was it possible, I say, when I came to know you better, to resist my heart's first impulse towards you? Although I knew, but too well, that my love must bring me misery and suffering, I loved you from the first moment I saw you. I loved you as my life."

He half turned away from her, and bowed his head upon his hand.

Cora was trembling. The momentary anger had passed away. She was a woman and young. She loved him, too, with the first passionate infatuation of her hitherto untouched heart. She turned to him gently, and put her little unsteady hand on his.

CHAPTER VI.

LORD ALMANE'S STORY.

For a few moments neither Lord Almane nor Cora moved nor spoke; then he turned to her, and caught her hands in his, pressing them passionately to his lips and brow.

"Let me tell you all," he said, in a hoarse, broken voice. "You will pity and forgive me then."

Sitting thus with her hands held in his, the passionate dark eyes fixed on her face, Cora listened.

"You thought very hardly of me this evening, Cora," he began, "when your brother congratulated me on my engagement—when he congratulated me on that which hangs like a millstone about my neck, and puts away from me all that would make life bright and precious. You may say that I am a free agent—that no one could hurry or force me into an engagement against my wish; but, my child, there are circumstances sometimes, which bind one closer than chains, under which a man is no more free to follow his own wishes than the captive in his dungeon. It was under such circumstances as these that my engagement was contracted. Lucie Belmont is my cousin, her mother and mine were sisters, and I have known and been intimate with her from her childhood and my early manhood. She is an orphan, and was brought up at Almane Park by my mother, whose dearest wish was that Lucie and I should be joined in a nearer, closer tie than that of cousinship. Still, it rarely happens that one falls in love with a girl one has known as intimately as I have known Lucie. I always looked upon her as a sister, and cared for her as such, with the quiet fraternal affection which never deepens into any warm feeling, which could never possess the warmth and passion of the love I feel for you, my beautiful darling. Nay, don't turn away; listen yet a little while, dear child.

"My father died," resumed the Viscount, after a pause, "while I was a little child. My mother, my dear mother, left me when I was nineteen and Lucie about ten. After her death Lucie went to reside with some connections of her father's and I went abroad. When I returned, after a long absence, I found that the girl I had left a child had blossomed into a woman, fair enough and gentle. The old intimacy was renewed between us. Lucie was presented three years ago, and since we have met often in the world, and have been intimate as brother and sister might be. Sometimes I wondered why my cousin did not marry; but last winter the reason for her persistent refusals became known to me. She seemed ill and unhappy, and any questioning on my part only elicited a passion of tears, and an avoidance which I was at a loss to account for. I found out the reason almost too soon. Cora, can you guess the rest?"

Cora's eyes were very soft and pitiful now. All the angry fire had died away, quenched in the dew of the large tears which welled up into the sweet eyes, and fell heavily on his hand as it clasped hers.

"Have you guessed it, my darling?" he went on softly. "Are you sorry for her, or for me? Ah! my child, I want that pity most, although I never knew that I should need it as I do now. One day her aunt, Lady Marlyn sent for me, and told me that my cousin loved me—that her only chance of recovery of health and spirits depended upon me, upon my love. Ah! Cora, had I known then, I think the sacrifice would have been too great, beyond my strength. But I was fond of the poor child. I pitied her—I cared for no one else—and I yielded—yielded, to find myself bound when I would be free—yielded, to find that I had put out of my reach all happiness and peace of mind, that I had given up the freedom in which I rejoiced, and obtained nothing in exchange. Nothing," he ended, passionately—"nothing but misery and unrest."

He dropped Cora's hands, and, turning from her, rose and moved away a few paces; then, turning to her side, he went on again:

"Am I forgiven, Cora," he said, pleadingly. "The temptation was so strong, how could I do aught but yield? You were so beautiful and so gentle how could I do aught but love you? I was an idiot—mad, if you will—to risk the danger, to play with edged tools. I was mad, but I suffer. I wish I alone could suffer, and yet I am selfish enough to be glad you care a little."

A little! when the girlish frame was shaken with a storm of sobs. He caught her in his arms, and with increased earnestness went on:

"Ah! child, you are so young; you will forget—you will be happy again; but I, with naught to look forward to in the future, cannot hope to do so. I shall hear of you, happy, beloved, and loving, united to a man who will care for you—ah! not more than I should have done—and I shall think 'she is happy, she has forgotten,' while I—"

She had bowed her head upon his shoulder, and was sobbing passionately. Stanley St. Roger felt the perfumed breath upon his cheek, the clinging clasp of the little burning hands, as he held her within his arm; and he knew that she was suffering, but he had no pity. He must keep the love he had won—the heart he had touched must be his. At whatever cost to her, his selfish passion should be gratified, and for that purpose they must part now, since parting was unavoidable—must part friends, with the fascination still upon her, with the spell of his beauty, of his eloquence, of his singular charm of manner, yet unbroken.

Holding her to his breast, he soothed the passionate emotion with tender, murmuring words, spoken in the low, sweet voice which was so pleasant to her. For a few moments she stood thus, yielding to the magic of his touch.

"Am I forgiven?" he whispered then. "Have you forgiven me, Cora?"

She withdrew herself slowly from his arms, calmer now, and struggling to regain her composure.

"There can be no talk of forgiveness between us," she said, gently. "Let us try rather to forget. She loves you, and you are bound to her. Make her happy, and happiness will come to yourself in the effort. Let us forget all that has passed, and should we meet again, let it be as friends."

"I could not meet you as a friend," he said, passionately.

"Then we must never meet again," was the low reply. "Let it be farewell now, Lord Almane, and remember that you have no friend who wishes for your happiness more than I do."

"Are you going thus?" he said, as he sank upon one knee at her feet and held her hands in his.

"Lord Almane," answered the girl, steadily, although she was trembling, "if, in the past, when I allowed you to speak words of love to me I erred, it was in ignorance. Now, were I to do so, knowing the ties which bind you to another, I should be indeed to blame. For any wrong I have done, I am expiating bitterly now," she went on, with a caught breath. "It is hardly my place to blame you for any suffering you have made me endure. I do not, Stanley, I do not. I deserved it all; but, at least, let it be the guilty alone who suffer, not the innocent girl to whom you are engaged."

"Is all your thought for her?" he said, bitterly and reproachfully, still holding her hands which struggled to free themselves from his grasp. "All your pity for Lucie? Do you not think I suffer, Cora?"

"What can I do?" she answered brokenly "Stanley, be generous; do not tempt me too far. Ah! you are using your power cruelly now. Let me go I say," she continued, with a sudden pas-

sion. "I am already despicable enough; do not render me more so."

She wrenched her hands from him with a sudden, violent effort, and then, swiftly and lightly as a startled fawn, she fled up the little garden-path, and he was alone.

Lord Almane rose from his kneeling posture with mingled feelings. He had never cared for Cora as much as when, in her wounded pride and love, she had turned upon him with bitter reproach, and had upbraided him for his betrayal of her trust. He knew now that no woman had ever touched his heart as this girl had done, and that he desired to retain her love with a fierce desire he had never felt before. His career as a lady-killer had been a very successful one; he could look back on many a heart lightly won and lightly lost; on many a high-born, dainty lady-love whose smiles he had basked in for a time, until he wearied of the petty game and turned to fresher sport. The last ten years were hardly pleasant ones to look upon.

He had entered upon life the possessor of a noble unsullied name and a great fortune, the latter of which was seriously impaired; to the former, if he had not disgraced it he had added no luster. For a moment he almost wished he could recall the past, with its faults and follies, and win back the years of reckless expenditure which had rendered his marriage with a rich wife imperatively necessary for the preservation of the estate which had descended to him clear and free from debt.

The story he had told Cora with such pathetic earnestness was but a partly true one. George Lecson's words were more correct; he had "wooed and won his cousin, and she was one of the richest heiresses of the day." But she was as he had said, fair and gentle, and had loved him, poor child, with a tenacity and ardor which would have perhaps wounded her to death, had she not deemed her love requited.

As he went slowly back towards the house up the narrow path over which Cora's little feet had fled so rapidly, he thought over all these things, and the retrospect was hardly a satisfactory one.

A light touch on his arm made him start from his reverie, and looking up hastily, he perceived a dark figure at his side, which the semi-darkness prevented him for a moment from recognizing.

—To be continued.

MY PORTER'S DAUGHTER.

"*Bon jour, madame;* any letters for me today?" asked my friend Jules of the porter's wife, as we descended from the three rooms and kitchen we occupied, and were wont to call our *appartments*. It is true they were *au sixieme*, but *n'importe;* they were light and airy, and from the windows a beautiful vista of house-tops and chimney-pots, with the Pantheon and the pavilions of the Louvre, met our gaze. "Any letters?" repeated Jules, as Madame Jacques, the portress, replied to his salutation.

The good dame smoothed down her apron, adjusted her cap, and having assumed an air of profound woe and commiseration, produced a letter, deeply edged with black.

"Ah, I fear monsieur will have bad news," said the little woman, "for I am sure such letters always tell of some one's death."

Jules took the letter, and was soon deeply engaged in reading its contents.

"Read it, *mon ami*, and tell me shall I laugh or weep," said he, having read the letter, and handing it to me.

"My dear aunt," he resumed, "peace be with her, whom I have not seen for ten years, has died, therefore should I weep; but she has left me ten thousand francs a year. Therefore I shall neither weep nor laugh; so we will dine at the '*Trois Freres*,' and drink to my good aunt's rest in their famed Burgundy, for it was her favorite wine, and——"

"Good morning, mamma; how delighted I am to see you," cried a sweet voice at the door of the lodge, and in another minute the speaker was in the arms of Madame Jacques.

"My dear child is it you?" exclaimed madame; "well, well, who would have thought of seeing you back so soon! It is my little Marie, messieurs," said the portress, her little eyes twinkling with pleasure in answer to our mute inquiries.

Marie turned, and, bestowing on us a roguish glance, made us a profound bow.

"Come, come, Jules," said I, grasping his arm, for he stood rooted to the spot, gazing at the blushing Marie, "come, *mon ami*, I long to taste the Burgundy," said I, fairly pulling him to the door. "Good morning, ladies," I added, and we were on our way down the street.

"I verily believe you have fallen in love," I continued. "Come, old fellow, it won't do for Jules de Quenille, with ten thousand francs a year, to fall in love with a porter's daughter. But Marie is handsome. Did you notice the bewitching eyes she had?—and such teeth! and as for her hands, they were as small and white as those of a duchess. I am sure she has a fine foot and ankle, for her figure is perfect. But I forgot to congratulate you on your good fortune, Jules. Why, what is the matter? You are in the clouds, *mon cher*."

"No, no, not in the clouds," said Jules. "I "I was thinking, that is—yes—I was thinking of my poor aunt. But Mademoiselle Marie is beautiful; you are right; it is a pity she is a porter's daughter."

Having honored the memory of the deceased aunt in a glass of Burgundy, we drank to Marie, and we spoke of Marie, and Marie it was for the whole evening. Even the *petit vert* with our *cafe* was emptied in Marie's honor.

Alas, my poor friend! I saw he was badly off when, for the twentieth time, the next morning he descended the six *etages* to see if there were any letters; but Marie was not there, and madame was out, so Monsieur Jacques kept house, and Jules' pride would not permit him to ask the old porter concerning her. He was proud, was my friend Jules; of a good family in the provinces, he had been brought up to regard good birth as one of the essentials which a wife must possess. It is thus with all Frenchmen; notwithstanding the many democratic principles they possess, pride of family is with them as striking as it was under Louis XVI. Though in the ordinary intercourse of life they forget or lose sight of these principles, yet when the question of marriage is discussed they revive in all their pristine force.

"Yes, *mon ami*," said Jules, laying aside his pipe, and smoothing his luxuriant moustache and beard, "now that I am a rich man I feel it a duty I owe my family to marry. But my wife must be of good family; and Marie is not. I know what you would say; you Americans, when you fall in love, forget all social distinction, but we French have more firmness, and can conquer our feelings. We marry for our family, and we grow old and feel happy that we have done a good action; this is true greatness. You Americans cannot comprehend it."

"Then you'll forget Marie," said I, "and won't see her any more?"

"But I will see her again," he replied, "and only to speak to her, that I may forget my unfortunate *penchant;* for you know an illiterate woman disgusts me, and I am sure she is without education."

An hour afterwards as I passed the porter's lodge on my way to the post-office I saw my friend engaged in an animated conversation with Marie.

"Are you disgusted with her, Jules?" I asked on my return that evening.

"I am more in love than ever," he replied; "she is as well-informed and accomplished as she is beautiful; but what would my father say?—she is but a porter's daughter."

"An," thought I," he thinks of what his father would say; assuredly she has gained one point: she has conquered his own pride."

Thus the week passed. Marie was only to be seen in the afternoon; she dressed in a style much above her station, I thought, but she was such a perfect lady that one lost sight of this apparent incongruity. My friend was perfectly enraptured; he spoke and thought of nothing but Marie. The merits of my own sweet little betrothed were quite eclipsed, or rather never mentioned, for when at times I would endeavor to speak of Lizzie I was interrupted and bored with the name of Marie. I could not blame my friend nor be angry with him, for heretofore Lizzie's name and merits had formed the staple of our evening's conversation.

One evening we returned home earlier than usual, and were surprised to hear the sound of a female voice singing in our rooms. We stopped and listened at the door. It was a love song from the opera of the *Pre aux Cleres*, a favorite of my friend's.

How beautifully she sang!—with what style and execution! She was a finished artiste. We stopped at the door until the last note had died away and was succeeded by a lively *valse*. Then we entered.

"It is impossible! It can't be!" cried Jules.

But it was Marie, who, rising from the piano as we entered, stood suffused with blushes.

"I beg your pardon, gentlemen, for my presumption in entering your rooms," she said; "but madame was here arranging them, and I came up to keep her company."

Madame's head, with her twinkling, mischievous little eyes, just then peered forth from the adjoining room, as if in proof of Marie's statement.

"No presumption whatever, mademoiselle; it is an honor," said Jules. "But I beg you will once more sing my favorite song."

The sun had long since cast its last rays on Montmarte, and madame had a dozen times risen to go, and still Jules and Marie were at the piano. My friend was an accomplished performer on the piano, and an enthusiastic admirer of music. They sang duets and solos without number, and when at last Madame Jacques said she must go, it was with regret they parted.

The morrow was Sunday; we slept longer than usual on that day, and ten o'clock had sounded from a neighboring steeple when Madame Jacques entered the room with two letters, one for Jules and one for me. Mine was from Lizzie; she was educated in France, and she told me that she intended paying a visit to an old school-fellow of hers, Mademoiselle Ernond, who resided at the Chateau de Beauville, near Rouen; and, further, that she expected me to pay her an early visit there. I could bring my "double," thus she called my friend, with me. I jumped out of bed, delighted at the prospect of seeing Lizzie so soon, and hurried into Jules's chamber. I found him intently occupied with a little rose-colored billet.

"What, a *billet-doux!*" said I. "Pray who thus honors you, Monsieur Jules?"

He handed me the note; the writing was delicate and ladylike.

"Monsieur," thus it ran, "I have to thank you much for the honor and pleasure you have afforded me by your pleasant society. I leave Paris this morning, and have no time to bid you adieu. Receive, therefore, monsieur, my best wishes, and believe me, with respect,

"MARIE."

"Well, it is bad news, *mon ami*," said I; "but if you love her, you must find out from madame where she is gone, and follow her."

"Ah, madame won't tell me her address,' replied Jules. "She says Marie has forbidden her to do so. She says she is gone to join the family with whom she resides in Normandy."

"But this is superb!" I exclaimed. "Read what Lizzie says. We will be off on Thursday morning, and having seen Lizzie, I will tell her of your love affair, and I am sure she will aid you, for a woman's wit is sharper than man's."

Thursday evening found us located in the hall of the Chateau de Beauville. The first raptures of my Lizzie were over, and we were seated near the fire which burned in the huge chimney. Jules was occupied with Lizzie's friend, Mademoiselle Ernond, while the rest of the family were variously engaged in other parts of the chateau.

I had determined to speak to Lizzie of Jules' love affair at the earliest opportunity, and this opportunity now presented itself. How her eyes sparkled while I narrated the story and described Marie! I thought she was amused at the idea of the struggles between pride and love that my friend had undergone.

I had scarce finished speaking when Mademoiselle Ernond rang; and when the servant appeared, she desired him to ask Maria to come to her.

"She is my companion," she said, smiling, to Jules; "a very beautiful and interesting girl, I assure you; but unfortunately, she is only a porter's daughter."

What! could we have thus fortunately found Marie without a day's search? Yes, sure enough, the door opened and there stood Marie.

Demure and humble enough was her greeting to us, but her eyes sparkled with an irrepressible fire that strangely affected me; I could not comprehend her. As lady's companion, she occupied a seat at table, and I noticed the servants treated her with marked respect.

I need not say with what rapidity the week allotted for our stay had nearly passed. On all possible occasions Jules was the attendant of Marie, and he did not escape the jests and laughter of the company on this account; but he bore them with extraordinary meekness and coolness for one so proud and hot-blooded as I knew him to be.

One day Lizzie and I were seated in an arbor in the garden; she had consented to fix on an early day for our wedding, and we were discussing our marriage arrangements, when suddenly we heard footsteps approaching, and Jules say, "Nay, Marie, believe me, I love you truly and dearly; can you return my love, and be my wife?"

"Can you then really sacrifice your principles, and brave your father's displeasure, by marrying a porter's daughter?" she asked.

"Trust me Marie, my false pride is all gone," he replied. "I love you devotedly, and ask you to be my wife."

The answer I could not hear for they had passed on toward the chateau.

"Well, Jules, I involuntarily heard your declaration of love to-day," said I, when the family had retired for the night. "What answer did you receive?"

"Congratulate me, my friend," he replied. "She loves me—she told me so; but she could give no positive answer about the marriage, she said; she must speak to her friends first—it is a duty she owes them."

The next morning at breakfast the unpleasing intelligence was given us that Marie had left the chateau, and left nothing to tell her whereabouts, or her reasons for doing so.

Mademoiselle Ernond appeared rather offended, but forgot her ill-humor when she was told that her cousin, Mademoiselle de Beauville, had just arrived.

The sadness which had seized poor Jules when he heard of Marie's departure was noticed by all, and there was many a laugh at his expense, when the door opened, and Mademoiselle de Beauville was announced. Could it be possible? Why, the lady who entered was certainly Marie.

"Jules, Jules," I cried involuntarily to my friend, who had forgotten his accustomed politeness, or did not hear the lady announced, for he remained at the table without turning, "Jules, is not this Marie?"

Before he could rise from his chair she stood before him, and gave him her hand. "I have spoken to my friends," she said, "and they are satisfied, Jules; therefore I will be your wife."

In an instant she was in his arms, closely clasped to his heart.

"But they announced Marie as Mademoiselle de Beauville," I said to Lizzie.

"Yes, it is true, Monsieur," cried Marie, freeing herself from Jules' embrace. "I am the heiress de Beauville, and not the porter's daughter."

"How could you impose on our credulity in such a manner?" I asked.

"Madame Jacques is my foster-mother," she replied, "and she calls me her daughter. When I met you it was an accident, and madame having called me her child, I determined to allow you to retain the belief that such was the case, for I felt interested in Jules, and soon found he loved me; and having discovered that you were the lover of my old friend Lizzie, I made a plan to meet you here and give Jules a trial to test his affection for me, for I have learned from Lizzie to wish for a husband that would love me for myself."

She hid her blushing face in Jules' bosom for a moment, and then asked, "Have you nothing to say, Jules? You won't be angry with me for the deception I have practiced, will you?"

"No, no Marie, I am too happy," he replied. "I only ask that Lizzie's bridal day may be also ours."

And thus it was settled. Jules and I are now both happy husbands; and when the late war broke out, Jules and his wife came to reside near us in New York.

J. P.

WASHINGTON LETTER.

MARY GAY ROBINSON.

Southern Orators—Society Pleasures—Distinguished New Yorkers.

WASHINGTON, D. C., March 1, 1878.

A GREAT day at the Capitol has just passed—the climax of the Silver Bill. The first interest centered in the House; its floor, galleries, and doorways were black with the crowd; a third of them could neither hear nor see, but they could say "we were there," and people go far to do that. The PRESIDENT'S veto was read. A silence like the grave fell over all the House, then they took up the bill, voted, and passed it by a large majority over the PRESIDENT'S head. When it was announced there was applause, stamping, and rapping such as I do not remember having heard before.

The galleries at once thinned out; members of the House left; business was resumed, but no one seemed inclined to heed it except the few who had speeches to make and those who came to hear them. There is no Congressman without his line of followers who will always be on hand to listen to his speeches, and applaud at the right moment.

J. N. WILLIAMS of Alabama, made a good plea for resuming the pension of the soldiers of the Mexican war. He read his plea and had all the discomfort of the going out of those who followed the Silver Bill over to the Senate where it was taken up almost immediately. If a man can talk well with inattentive listeners, he has a rare gift; but our Southern friends are invariably noted for their eloquence;—speech-making is their glory. Honorable ALEXANDER H. STEVENS can make the House pause in one of its noisiest performances, so strong is the hold of his mind and his infirmity upon the other members. He looks almost like a dead man, pale and wan as he works his three-wheeled chair up and down—sits with his hat and glasses on, while often congressmen stoop down to talk with him.

Hon. CHARLES O. HOOKER, of Mississippi next spoke for the Pension Bill. He has but one arm, the other was lost in the Confederate service.

He too is a born orator; the right arm is all-sufficient for his expressive gestures, his large, broad face flushes with intense excitement, a white moustache and black hair make him conspicuous and easily remembered. In spite of thinned floor and galleries, he is complimented by the silence of all who are present. It is a great success when a man speaks so people will stop to listen; he has then half-gained his cause.

Leaving the Representatives speaking on the Pension Bill, we find the Senate in its more dignified and solemn way repeating the scene just passed in the House. Every spot in the smaller hall of the Senate is filled. SENATOR CONKLING has a party of ladies in the diplomatic gallery which is usually empty and blue, for foreign diplomats care little about our Congressional doings and are seldom there, and the rule is their gallery must not admit any one else. The Representatives we missed from the House, are all here. Long sofas from side rooms have been brought in and when the ayes and nays are taken every man is watched to see how he votes. They are pretty surely pitted South and West against North and East. When the Silver Bill is passed one rejoices while another side groans. The amendment which is some panacea to those who opposed the bill is spoken of by the other side, as an act which future legislation can annul. The country has been tipping over into an abyss so long and has not gone clean over, we begin to believe it will weather all storms.

From the strife of Congress we turn to the glare and glitter of society which now flames up with its last brilliant efforts. This week witnesses the last receptions in many high quarters. Cabinet day, K Street, was gay with equipages; beautiful ladies in charming costumes dazzled the eye and the ladies of the Elliott and Riggs Houses also held their final levees. Many fashionable people go to Paris next month and use the intervening time to visit home, East, West or South.

The President's last evening reception was very brilliant. The Cabinet officers were all present, also Senator DAWES of Massachusetts and Senator BURNSIDE. Mrs. HAYES with her lady friends, are pronounced by all very agreeable. Mrs. HAYES wore white silk plain, with velvet and silk striped fringe, lace, folds and plaitings richly trimming it. Secretary EVARTS walks as quietly and self-consciously about in a Presidential levee as if he were walking through a crowd on Broadway. He takes no note of anybody, seems busy looking at his thoughts and revolving them over and over. He is as emaciated as ever, and one would scarce believe that he lived in the midst of plenty. The thin, wiry people are reckoned among workers, and the angular Secretary is supposed to be the personification of industry, but overwrought energy is not the best. His physician ought to prescribe more play and less work, or he will never see a mellow old age.

Mr. BIERSTADT, the artist, is visiting at the White House. On sunny afternoons we see the HAYES family and their distinguished guest riding out through the pleasant suburbs, and at receptions the artist is an honored friend, pronounced by all a very handsome man. Among foreigners, one of the most curious physiognomies is that of a gentleman who is stepson of Pere HYACINTHE—one of those German-French faces of intense homeliness which you have to learn to like, as we like bitter when opposed to too much sweet.

We took for a study the other day the face of a beautiful society belle. The first thought is, "How exquisite! A joy forever!" Then you are a little weary and at last turn away, as you would from a repast on sugar. The plain people may rejoice, for they are as necessary to the attractiveness of a company as the beautiful. It is a comfort to meet the "nobodies." They are so simple, unaffected, and demand no admiration or attention at your hands.

The evening receptions at Secretary EVARTS' have been very enjoyable. The last took place on Thursday evening. The whole house was thrown open, and all the world was there. The ladies' toilettes, however wonderful they were, at first had small chance of display, for the crowd; but Mr. EVARTS himself never looked so well as when playing the part of generous host. His face was smiling and happy, rejoicing to give so much pleasure. Speaker RANDALL and wife were the center of attraction in one part of the room; in another, Mr. and Mrs. YOSHIDA, the Japanese Minister and his pretty wife, Secretary CARL SCHURZ and his interesting daughters; while Mrs. EVARTS and her daughters were always the agreeable hostesses. There are a few parties still to come, but none can be more pleasant than this one has been.

SEAL-SKIN FUR.—In killing the seals much care is used. The instrument of destruction is a long club of hard wood, with which the animals are struck a violent blow on the head. One is usually sufficient. A long, sharp knife is then thrust into the vitals, and the carcass laid aside; and so on until about one thousand have been slain, when the work of skinning commences. When taken off, the skins are salted, and sent home in that condition. On arrival here they are properly cured; and then comes the preparation needed for their conversion into what is popularly called "seal-skin." It is difficult to conceive how that beautiful article of dress can ever be manufactured out of the very unattractive object the skin presents at this juncture. It is as hard and unyielding as a board, and the stiff, coarse hairs cover the fur so completely that its very existence might be unsuspected. How to separate the fur is a problem. For many years each individual hair was plucked out separately, at, of course, a vast expenditure of time and money, until a lucky accident revealed to the dressers that the roots of the hair were more deeply seated than those of the fur. Now, therefore, after the preliminary preparation, the skins are laid hair downwards upon a wooden block with a curved surface, and pared down with a knife until the roots of the hairs have been cut through, and the skin is very little thicker than a kid-glove. All the coarser hair can then be brushed off with the hand, leaving the fur, which is then seen to be arranged in small curls, of a light-brown color, varying slightly in shade in the different parts. In consequence, nearly all "seal-skin" is dyed before it is sold, and in the process of dyeing the curls untwist themselves, and the fur becomes smooth and ready for use.

LIGHTNING-CONDUCTORS.

FRANKLIN meant the lightning-conductors which he invented to consist of iron alone. Iron, however, has too strong an affinity for oxygen to allow of this. All moisture, and all heat, corrode it more or less; and thus grew up the custom of pointing the conductors with copper, and in some cases with costly platinum, soldered to the iron rod. But exposure to weather, and the weak galvanic currents which unavoidably set in where metal of one sort is in contact with metal of another sort, cause rapid decomposition at the joint, and encourage the rust to eat into the substance of the rod. A heavy flash will melt or cripple a conductor thus imperfect, and then woe to the structure! This defect can now be cured by coating the iron rod completely with nickel, a metal which defies rust, and which conducts electricity better than the pure iron does. Bars and rods of this nickelized iron have been kept under water for several days without tarnishing, and resist the effects of the most powerful battery of Leyden jars.

It had been believed, until lately, that platinum was a metal with which no rogue, however dexterous, could tamper. The platinum coinage of the Russia of thirty years since was considered inimitable by the manufacturers of false money; while the capsules, crucibles, and other apparatus required by scientific men were sold according to the high market value of what is really a precious metal. Unluckily, fraud has been found possible even in this case. The Director of the Royal Italian Observatory on Vesuvius, M. de Luca, surprised at finding first one and then another of the platinum points of his conductors melted by the effect of lightning, made a careful investigation, and discovered that the platinum had been adulterated with from ten to twelve per cent. of lead, and thus rendered fusible. Platinum thus mixed with an inferior metal can be identified by its lesser density, or more easily by the blowpipe, before which a tell-tale green flame will reveal the presence of the lead. Such a mixture would render the hitherto resisting platinum absolutely worthless in the laboratory.—*Chambers Journal.*

I HATE that man worse than poison that offers to run away when he should fight and lay stoutly about him. Is it not better and more honorable to perish in fighting valiantly, than to live in disgrace by cowardly running away?

For Women.

[CONDUCTED BY MISS FAITH RIPLEY.

LOST.

A HOUSEHOLD darling, but four years old,
And the night is falling dark and cold.
"Lost!" is the anguished mother's cry,
With ashen lip, but tearless eye.
There is gathering now from cot and hall,
The hills resound with halloo and call,
Seeking, for tender Mercy's sake,
The lost, through wood, and swamp, and brake.

A shot rings out on the wintry air—
A sound that answers the mother's prayer:
Another! another! in salvos ring,
As home in triumph the lost they bring.
Close-clasped in her father's arms she lies,
Faint and weary, with half-closed eyes.
"O Papa! I'se tired!" Now closer pressed,
She hath fallen asleep on her father's breast.

Lost! A woman yet young in years,
But old in sorrow, and pain, and tears;
Lost through her trust, and truth, and love:
O God! that *these* should devils prove,
Dragging her down to sin and shame,
To a blighted life and a tainted name.
Proud woman's scorn, man's ribald jest,
Mock the breaking heart and the aching breast.

There are none who seek the lost one now,
No hand to soothe the throbbing brow;
On a cold stone step, in the chill night-air,
She lies half-hid by her golden hair.
The pale lips mutter—blue eyes are dazed,
As if on a brighter world they gazed—
"Dear Lord, I'm weary—give me thy rest!"
She hath fallen asleep on the Father's breast.

Aye, Madam, gather your dainty skirt,
Uncontaminate by this human dirt:
Hers was a crime may no pardon win;
'Twas love—and love like hers is sin.
A smile and a blush for the profligate—
For thy sister-woman, scorn and hate;
Hunt for her as beagles hunt their prey,
Till the grave hath hid her shame away.

O "humble shepherd" in silken gown,
"Meek," with supercilious frown,
The charge the Master bade thee keep
Was, "If thou lovest Me, feed My sheep."
A Magdalen hath perished here,
With clay-cold cheek and frozen tear.
At the shepherd's gate a dead lamb lies,
Shaming a Pagan sacrifice.

[*A. H. Howe, in Chicago Tribune.*

LETTERS FROM A COUNTRY GIRL.

MARGARET B. HARVEY.

I SHALL begin this second letter by correcting an error in the first. The printer, or perhaps my own penmanship, made me speak of a mixture of linseed oil and *amber*; the word is *umber*.

Say that you have followed out to the best of your ability the few suggestions given. Then you find your house in a fair way towards becoming a cheerful, bright, pretty, refined home. And this is what you want. "Live while you live," is a good maxim, as well as an old one when applied in its higher meanings. That is, remember that our homes, and the opportunities, interests and affections of our homes, are the highest and best earthly objects for which we can work and from which we should derive our most constant and lasting enjoyments. Think of this every mother, the center of a home. Try with all your might to make it to all its inmates, the most comfortable, the most beautiful, the most beloved spot on the face of the earth. So keep continually in view the aim with which you started out.

Whether you have or have not purchased house and home papers, read and study all intelligent suggestions that come in your way on the subject of home decoration. You cannot adopt all of them—you may, perhaps, none of them—but they can scarcely fail to quicken your inventive faculty and put you in the way of creating something pretty very often. So here you may be safely left for the present. The next book suggested was, "The Schoolmaster's Trunk," by Mrs. DIAZ. In this admirable volume we have, in a very small compass, many vivid pictures of life as it is too often found in some country districts, the hard work, the narrow sphere, the unattractive homes, the ignorant conversation, together with high encomiums on woman's wonderful executive ability, which rightly directed, would revolutionize all. This book you bought for the express purpose of lending to your neighbors around, as it contains so much, and your idea is to elevate the tone of the neighborhood as well as that of your own house. Remarking that here is a good book which, though a little personal, contains many valuable hints, quietly hand it to any one who, as you find on inquiry, hasn't it, and as you continue to do so, you cannot fail to do good.

The chief point dwelt on, I think, and which I want to consider, is the duty of dividing the time so that the least important affairs of a household shall take the least part and thought, leaving as wide a margin as possible for rest, culture and higher duties. This is reasonable. As I said before in substance, the minor details of living—such as eating, sleeping, and dressing—with the necessary work occasioned by them, are but means toward living itself—the foundations of a temple. So all the opportunity and energy diverted from unnecessary care about the lower, may profitably be given to the higher living. Remember, that the effects of the former will pass away, the effects of the latter never will. Having accepted this fully yourself, and influenced some of the neighbors to do likewise, you have made considerable progress toward the end for which you are striving—the elevation of your home and the surrounding community.

Keep the book in circulation till it is worn out. By that time the people generally will understand your new departure, like your improvements, and be ready to carry on the good work for themselves. And don't be surprised if some, catching at your suggestions, rush ahead of you and hit upon and put into execution some pet plan of your own, even before you have it fully matured. But never mind. In thinking of the common good, you can well be content to sacrifice a little private inclination.

Country people have their faults—their chief one is closeness—but they are always sociable. When a claim is made upon their hospitality, they are generous. When distress calls them, they are heroic. But when a common interest presses upon all, where else than in the country can we find such warm sympathy, such real union, such earnest endeavor? And all these and more, will show themselves sooner or later, as this same purpose inspires the neighborhood. Slowly but surely, all will want to help, and insensibly the tone of ordinary conversation will rise. At the gatherings the difference will be noticeable. Less will be said about private concerns, more about the new order of things, this improving continually, as the order itself improves.

So much for the second book. The botany I recommend because I believe every woman living in the country, or anywhere else, ought to know something about objects so dear to her. The effects of even a little conscientious study of this beautiful science will soon be seen in more tasteful, enjoyable gardens, more natural floral decorations, and more life-like flower-pictures as well as enlarging the capacity to appreciate intelligently, the diversified attractions of field and wood and meadow. And when the club is formed (I will tell you about it presently), the herbariums, the fresh flowers and plants, the conversation of the members regarding them, will form some of its chief attractions.

Of the cyclopœdia I will say that you will constantly need it in your general reading. Go to it every day of your life. Every name, or place, or object, or circumstances mentioned in your hearing, in the newspapers, in any book, even to your Bible, refer to carefully. Do this a little while and you will wonder how you did without it so long. And you will need it the more as time goes on and your scheme progresses.

I have now briefly sketched out a plan which I hope to elaborate more in detail, for improving your home, for influencing your neighbors to do the same with theirs, and for creating a community of interest and feeling of oneness regarding personal and general culture. With these few books in the hands of a woman having *will* and a true desire for growth, no one can foresee what wonders may not be accomplished.

DIVORCE.

MRS. POTIPHAR.

THE apathy with which the general public regards the increasing facilities for "shuffling off the coil" matrimonial, and the avidity with which large numbers avail themselves of these facilities, can only be accounted for on the ground that people do not realize how widespread is the desire to make the marriage tie less binding. It is no longer counted as disgraceful for a husband and wife to seek redress for real or fancied wrongs in a divorce court; on the contrary, it is considered an evidence of emancipation from tyrannous custom—progression, in short. After all that has been written and preached on the great need there is of maintaining the purity and the sacredness of the marriage relation, it seems almost superfluous to even advert to it; but people seem not to be alive to the danger there is to the family and the State in tampering with the laws regulating marriage. Women especially should rouse themselves to combat, with all their energies, the loosening of marital ties; for where marriage is held in light repute, there woman is dishonored.

Marriage is not, as many apparently regard it, a holiday experiment; it is a life-long contract which, when once entered into, can be dissolved only by death. "Whom GOD hath joined together, let no man put asunder," has become a dead letter. Hardly has the officiating priest pronounced these words of solemn command, before one of the couple finds the other to be "not congenial," and forthwith a divorce drama is enacted with the usual washing-of-soiled-linen accessories. A decree grants the coveted freedom, and the two who swore "to be and to have for better or for worse," lightly break their vows, and go their separate ways.

There is one unpardonable sin-marital, which one would be lacking in dignity to condone; but even in the most aggravated cases, would not a separation vindicate one's honor quite as effectually as a divorce? Then the wrong of a *re*-marriage would be avoided. What right have divorced couples to marry? *None.* In the eyes of the law, it may be justifiable, but morally it is *criminal.*

In the divorce court of to-day the flimsiest pleas—such as "incompatability of temper" and other sentimentalities of that class—are admitted as good and adequate reasons for repudiating solemn obligations voluntarily assumed. What a picture it gives of the average morality of a people when such pretexts as the foregoing are permitted, without a protest, to be registered as sufficient to absolve couples from the performance of their duty. The fact that one's life partner fails to fulfill our ideal, or that unlovely characteristics develop in him, affects the matter not at all. If during the courtship we allowed our affections to blind our judgment, the fault is ours, and the only honorable course for us to pursue is to philosophically accept the situation, and bear our burden of disappointed hopes with what grace we can.

Divorce should be abolished. It is inimical to the best interests of the family and of society, it puts a premium on immorality, and it behooves the lovers of virtue to insist on its total abolition.

Many estimable people, while regarding divorce with disfavor, still hold that it is the duty of a couple to separate so soon as the love between husband and wife has ceased to exist. They maintain that it is little short of desecration for people to live together when the ardor of their youthful affection has abated. Besides being sinful, this is absurd. It is absolutely impossible for people to maintain their emotions at the high pressure of youthful rhapsodies; and, in fact, it is not at all desirable that they should, after all. Thrills, sighs, tears, and moonshine are inconvenient for steady matrimonial experience.

Love is largely a matter of volition—romancists to the contrary notwithstanding—and most married people can (if they only will make the endeavor) retain for one another a strong regard, and it is certainly worth the effort.

No right-minded person will gainsay that it is preferable to marry for love; but it is a most pernicious doctrine to advance, that a change of sentiment is sufficient to justify our refusing to fulfill solemn obligations.

Human nature is, on the whole, not given to constancy, and it requires strong public opinion and not a little coercion, to keep many people faithful. Even with the best of us, there are times when thoughts of "might have been" obtrude themselves, and when perhaps a fair face or an attractive manner causes a momentary thrill; and whereas now we crush back such memories and emotions as dishonoring to our better natures, if loose rein is to be given to sentiment, and emotion set up as the sole basis and limit of marriage, will not the tendency be to encourage a longing for affinities, congenial spirits, and a distaste for whatever tends to "cabin or confine" sentimental aspirations?

Think of the misery a universal application of such ideas would bring upon society! It would alienate parents and children, break up the home circle, bring upon us social anarchy; Oneida Communityism would be the next step, and the final one, perdition. Those who are interested in the cause of good morals, or who care for the well-being of the nation, would do well to zealously guard the sacredness and the *permanency* of the marriage relation.

ANSWERS TO CORRESPONDENTS.

WILL the lady, who sent me a sum of money to purchase some material for stamping, please send her address on a postal card, naming sum sent to avoid mistakes. The letter has been mislaid.

FAITH RIPLEY.

MINNIE PALMER.—Flower hats are still worn and their popularity is likely to continue through the season.

MRS. L. B., Cornwall, N. Y.—Summer silks come as low as 65c., but they are suitable only for second-best. For "dress" occasions, the expensive imported grenadines will be popular during the coming season.

JENNIE LEE.—Bead-trimming abounds on parasols, wraps, mittens—in fact, everything is beaded, so that you need have no fear that your beaded jacket will be out of style.

L. W. C.—India shawls are fashionable. Should you desire information as to price and quality, I shall be happy to furnish the same.

[Many answers to inquiries have been crowded out for want of space.—ED.

THE newspapers are fond of telling stories about the cowardice which women are alleged to show in the presence of a mouse. A severe masculine censor once declared that the most grave and wise gathering of women, for the most important and serious purpose, could be utterly thrown off its balance by the letting loose of a mouse in the room. That was men's theory. Here is fact:—"While a Judge was holding court at Van Wert, O., a few days ago, a mouse took advantage of his preoccupation and climbed up inside his pantaloons. The attorneys and attendants became aware of the situation when the Judge suddenly gave a jump, clapped his hand to his legs and stamped on the floor. The Sheriff rushed to the rescue, and the spectators rose in their seats, not knowing what was about to happen. The Judge whispered to the Sheriff, a lawyer shook the intruder out, and in the general confusion that ensued, the mouse escaped." Fancy the howl of derision that would have gone up from "the superior sex," if this had happened in a court presided over by a woman!

THE Christian Intelligencer announces, with apparent despair, that "ladies who do not know how to bake bread are learning how to bake terra-cotta ornaments." This is shocking! but it may also be recorded that gentlemen who do not know how to smoke a ham are learning to smoke cigars and meerschaums, all over the country, and have been doing so ever since it was settled. Whither are we drifting?

WHEREVER desirable superfluities are imported industry is excited and thereby plenty is produced. Were only necessaries permitted to be purchased, men would work no more than was necessary for that purpose.—*Franklin.*

The Querist.

ANSWERS TO CORRESPONDENTS.

Phonography and Stenography.

J. N. M., Montville, N. J.—Will the RURAL please inform me whether Phonography and Stenography are the same, and if not, which one would it recommend a young man, who desires to become a reporter, to study? Also, will it recommend a suitable text-book?

ANS.—Phonography and Stenography are different forms of the same art. In the latter, certain signs or characters are used to represent whole words; but the system is being rapidly superseded everywhere, by phonography or phonetic short-hand. In this certain sounds are represented by distinctive characters—the consonants by straight lines and curves, the vowels by dots and short dashes. There are also a multitude of abbreviations. The system was invented by ISAAC PITMAN of Bath, England, and was first published in 1837. Since then various changes have been made by the inventor and other short-hand writers. The best text-books published in this country are: "Manual of Phonography," by BENN PITMAN of Cincinnati, brother of the inventor, and lately prominently before the public in connection with his wife's cremation; "The Handbook of Standard Phonography," by A. J. GRAHAM, and "The Complete Phonographer," by JAMES E. MUNSON. Your local bookseller can procure you either.

Destroying the Fertility of Eggs.

F. C. F., Morristown, N. Y.—Will Mr. HALES please inform me through the RURAL, whether the fertility of eggs can be destroyed without injuring them for market purposes, and if so, how can it be done?

ANS.—There are ways of destroying the fertility of eggs without injuring them for market purposes. One way generally believed to be effectual, is to hold an egg tight in one hand, raise the hand above your head and give it a very sudden jerk downward. This may be looked upon by some persons as a very questionable question and answer; yet, I presume, the inquirer has some reasonable motive for seeking such information. For instance, a breeder of pure-bred poultry may have more eggs than he can dispose of at fair prices for setting, and wishing to turn them to account, sends them to market as ordinary eggs for cooking. If he lives in a small town or village, some selfish neighbor knows that he keeps good fowls, wants to obtain the stock, and is too mean to pay a fair price for them; hearing that some surplus eggs are sent to the store or market, this covetous but parsimonious individual goes and purchases them or changes others for them, and so procures the stock for a mere trifle, which his neighbor has paid high prices for, and spent much valuable time in improving. This is not doing as one would be done by, and to frustrate such a proceeding is justifiable.

Reclaiming a Peat Marsh.

J. T. Pratt, Richland Co., Wis.—I have a peat marsh of 12 acres which is three feet deep to hardpan. Will the RURAL please tell me how it can be reclaimed profitably?

THE first requisite is to insure good drainage, so that the basin of the marsh may be emptied rapidly after showers, especially in summer. The best means of effecting this is to put down covered drains deep enough to take off all the water. If the swamp lies on a clay hard-pan impervious to water, and under this there is a stratum of gravel, drainage may be effected by sinking wells at intervals through the hard-pan, and these would also help to improve the character of the subsoil rapidly. Before attempting this method on a large scale, however, it would be well to sink one well as an experiment, and watch the results. If the water disappears in the vicinity of the well, it will pay to sink others. When the land is thoroughly drained, it should be plowed deep and cross-plowed to dry the top; then burn this off, mingle the ashes with the rest by plowing and harrowing, and sow timothy, red clover, or perhaps corn. Such peat is a very valuable manure for sandy land, and an application of sand will also greatly improve the peat.

Beet Culture.

Thomas H. Malony, Seneca Co., Ohio.—I wish the RURAL would give me some information about raising beets for stock, and the best variety. My soil is damp sandy loam and very rich. The information will oblige a new beginner.

ANS.—Norbiton Mangel Wurzel if the soil is deep, Warden Orange Globe, Long Yellow, Yellow and Red Globe, Red Tankard and Golden Tankard are all good. To thrive well, Mangels require a deep soil, and the ground should be plowed deep and generally subsoiled a foot to eighteen inches, but whether the later operation would be advisable on your farm depends on the amount of moisture in the soil and other conditions mentioned in answer to a correspondent in the last issue of the RURAL. Apply plenty of rich manure, sow in May in rows eighteen inches apart and afterwards thin out to eight inches in the row. On the first frost, dig and store in the cellar, or if you can secure a high, dry spot in the field, they can be safely preserved there in trenches; but you should be careful to maintain free ventilation by placing bunches of straw on end at intervals of four or five feet. Don't store too many in the same pit, and they should not be covered until frosts become quite severe.

Chinese Yam.

A. Duncan, Wm. H. Koller and others.—I read in the RURAL of Feb. 9, an article on the Chinese Yam and would like to know where the seed can be procured, as I would like to try its cultivation?

ANS.—We have to say for the benefit of many inquirers, that if they want this vine for *ornament*, probably they will be pleased. If for a crop in lieu of potatoes, they will be *disappointed*. In an amateur way or for a curious dish, it may be well to cultivate a few. The roots are 18 inches or more long, club-shaped, the larger end down. The flesh is white, mucilaginous and liked by some. The digging of a crop owing to the depth to which the roots go perpendicularly down, would be very expensive, especially as being extremely brittle, they cannot be pulled out but must be dug under.

The seed cannot be procured that we know of. In fact so far as we are informed there is no female plant in this country. Little bulblets are plentifully formed in the axils of the leaves or stems about as large as peas. These germinate and grow freely. They will fall upon the ground, remain over winter and spring up the next season. THORBURN & Co. and B. K BLISS of this city, have the bulblets for sale.

"Beauty of Hebron" Potato.

D. L. R., Fredonia, N. Y.—I notice in the last issue of the RURAL, under the head of "What Vegetables to plant," the name of a new variety of early potatoes, "Beauty of Hebron." (1) Will you please inform me where and for what I can get some for seed? I have heard of none in this section and would like to hear more fully about it. Also (2) if plants, such as cabbage, cauliflower, celery etc., etc., can be shipped safely and how? I want to raise a considerable number of onions this year, for a good profit; would you (3) buy sets or grow from seed sowing some seed for sets next year?—say about one acre of onions.

ANS.—(1) You can get seed potatoes of "Beauty of Hebron" of J. M. THORBURN & Co., 15 John Street, N. Y. We have heard that they are earlier than Early Rose and excellent in every way. The price is $4.50 per bushel or $9 per barrel. (2) They can be shipped with perfect safety, packed in a little damp moss or other moist covering and wrapped in oil paper. (3) From seeds as you say.

Eradicating Wild Thyme.

Irvington.—My lawn is overrun with wild Thyme, living through the winter and grasping the ground with a firm hold. I have found it impossible to eradicate it by tearing or digging. Can the RURAL inform a subscriber of the best course to pursue to exterminate this disagreeable pest?

ANS.—We cannot except by carefully pulling up each plant by the roots. We were not aware that Wild Thyme (Thymus Serpyllum) ever became a great pest upon lawns that were well cared for and frequently cut.

Miscellaneous.

W. C. H., Campbell's, Tenn.—Would it be a profitable use of hen-manure to scatter daily half a bushel or more of it in the cow-stable, mix it with the stable manure and then in fall, use the entire amount as a top-dressing for rye.

ANS.—Poultry manure is so excellent a fertilizer, that its use in any form, sufficiently diluted, must be remunerative. With the shrewd farmer, however, the question with regard to everything on his place should be, not will this method be profitable? but is this method the most profitable? And the RURAL has frequently given at length its opinion of the best use and treatment of hen-manure.

B. A., Erie Co., Pa.—I saw in the RURAL that there was a premium of some flower seeds offered to those that took the paper, and as we have done so since February, I hasten to send in my claim. I do not understand whether we are to select the seeds or you are to make the selection. I hope they may be such as to make beautiful house-plants for winter, as I live so secluded from society that plants and a few pets are the only company I have. Hope you will send a Pelargonium "Rienzi."

ANS.—To explain to our *new* friends: For the past two years we have made free seed distributions to our subscribers, and it is our intention to make another during the year. The seeds, for the most part, will be such as can not be procured from any other source. Last year's distribution closed by limitation on the 1st of January.

L. W., Round Mountain Station, Ala.—(1). Where can I get Australian Gum trees; and are they the same as the Gum trees of this continent? I have examined the catalogues of several seedsmen, but can find no mention of them. (2). I wish to buy a mowing machine. Our grass here is of a peculiar kind, and stands on not very level ground. I would like to get a strong machine, but one that can be easily drawn by two light horses.

ANS.—(1). The gum tree of this country is Liquidamber styraciflua, that of Australia various species of the Eucalyptus; the chief of which introduced into the United States, is E. globulus. This is readily grown from seeds, and can be purchased from many florists, among others, from THORBURN & Co., 15 John St., N. Y. (2). There are many excellent mowing machines, the merits of which are about equal. Among the best that it would be well to examine are: The Bradley Mfg. Co.'s, made at Syracuse, N. Y., "The Warrior Mower," Little Falls, N. Y., "The Buckeye," Springfield, Ohio, and "The Eureka, Towanda, Pa. Circulars descriptive of these machines can be had by applying to their respective makers.

W. E. Emery, et al.—See notes from the RURAL Grounds, this issue.

News of the Week.

CONDENSED NEW YORK TELEGRAMS.

SUNDAY, March 10.—It is believed in Washington on what is thought good authority, that the La. "Returning Board" prosecutions are ended and that convicted Anderson will soon be pardoned. The M'Garrahan claim for the quicksilver property now held by the New-Idria Quicksilver Mine is up again before the Senate Committee on Public Lands.

In the event of movements by England hostile to Rusia Lord Derby will resign the Ministry of Foreign Affairs and be succeeded by Lord Lyons, formerly British representative at Washington and lately Minister at Paris. The *people* of England are no doubt violently inflamed against Russia, as all public demonstrations shew, but—well, its probable their bitterness must be confined to their own tight little island.

MONDAY, March 11.—The project of testing Mr. HAYES' righ to the presidency is gathering strength. Ex-Judge Black, Montgomery Blair and a number of other lawyers and Democratic politicians propose to bring the question to judicial settlement. Gloucester, Mass., fishermen complain loudly of outrages on them by Newfoundland Britishers. Our foreign office has called the attention of the English Government to the matter, and it does not increase the Canadian chances of touching those $5,000,000 awarded them for fishing damages. Atlanta, Ga., felt the worst tornado yesterday ever known there. The Episcopal Church was demolished during service, but as the congregation threw themselves under the seats by the advice of the minister all miraculously escaped death, though eighteen were more or less injured.

For the past week there has been a lull in European news; except the receipt of telegrams containing conjectures, contradictions, and unreliable information of diplomatic movements and tendencies, furnished chiefly to fill newspaper columns. The news appears to be confirmed that Suleiman Pasha was drowned in a sack for having entered into a conspiracy to depose the Sultan. Moreover, his slaughter of his command by hurling them at the Shipka Pass, his insubordination which paralized Mehamet Ali, and his blundering movements as commander-in-Chief deserved the infliction of many such examples of Ottoman vengeance. The treaty of peace between Russia and Turkey has been ratified, and it seems mutually agreed that they will not recognize the right of any Power or Congress of Powers to interfere with its terms.

Manufacturers of Clothing and ladies' suits find the New Davis Sewing Machine adapted to the full range of their work, trimming, binding, sewing thick and thin goods, over-seams, without any difficulty, and requiring no basting or change of tension. The DAVIS SEWING MACHINE Co. are enlarging their manufactory at Watertown, N. Y., to enable them to supply the increasing demand for their machines.

Happy tidings for nervous sufferers, and those who have been dosed, drugged and quacked. Pulvermacher's Electric Belts effectually cure premature debility, weakness and decay. Book and Journal, with information worth thousands, mailed free. Address PULVERMACHER GALVANIC Co. Cincinnati, Ohio.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 9, 1878.

BEANS AND PEAS.—Receipts of beans past week, 5,732 bbls. Medium beans are quoted as before, but holders do not look for further falling off in prices for prime stock, and there is less pressure to sell. During the past three years the war in Cuba has enlarged the exportation of marrows, but with quiet rates ruled in that important island, former shippers are not venturing so freely. It is unusual to see mediums and marrows so nearly similar in price. Neither pea, white, nor red kidney has much activity in the generally quiet market that prevails. Canadian peas steady at 85c., bulk and bond. Green peas very dull at the low figure of $1.15. Southern B. E. peas nominal at $3.25 ₱ 2 bush bag.

We quote:—Beans, medium choice, $1.70@1.70; other, $1.45@1.55; marrows, choice, $1.70@1.75; other, $1.55@1.65; pea, $1.55@1.80. White kidney, choice, $1.70@1.80; other, $1.85@1.95; red, choice, $2.25@2.50; other, $2.35@2.40. Turtle soup beans, $1.50. Lima, $3.

BEESWAX.—There is but little demand from either exporters or home buyers. Western and Southern quoted at 27@28c.

BROOM CORN has a freer demand from consumers and holds firm.

Green brush at 6@7½c.; green hurl, 5@6½c.; medium green, 5@6½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—The first few days of March have had a rather intimidating effect upon butter merchants. There is at present nothing to build late spring hopes upon if the opening is as mild in the important dairy districts as it is in a wide adjacent area. There is no frost in this neighborhood to waste spring's sun-warmth and the meadows seem ready to assume their green grandeur as soon as a few seasonable showers bid winter a glad and positive adieu. With our liberal stock of butter and comparatively free receipts, sellers feel warned that there is no time to be lost in pushing trade and all grades of butter are named easier. One thing seems pretty well settled and that is much of the surplus of medium, and as some term them "wilted" lots, will not run down fast enough to save them from grease at the worst or exporter's option at the best. Shippers have taken over 3,000 packages this week at a range @12c. for Western. Most of late local trade in butter has been at prices verging towards annexed inside rates.

We quote State creamery, 25@35c.; fancy pails, 30@32c., other 25@28c.; creamery, good to choice, 25@35c.; half tubs, fine, 28 30c.; extra, 33@37c.; other, 22@27c.; Fall Welsh 27@28c.; Welsh tubs, dairy, 25@27c.; other, 20 23c.; full dairies, fine, 28@30c.; common, 20@24c.; firkins, 20@27c.; poor State, 14@21c.; Western creamery, good to choice, 35@37c.; poor to good, 25@32c.; factory, choice, 20@22c; good, 16 18c.; common, 7@11c.; rolls, 12@18c.; grease, 6½ 7c.

Receipts for the week, 18,397 pkgs.

Exports past week, 932 pkgs.

CHEESE.—The English market is at a decline, and exporters will purchase importers' lots only as they get easier terms. The decline for the week is about ½c., and at the close there is a desire to sell, as supplies are arriving beyond expectations, and with the advanced season the disposition is to keep stocks down as close as possible.

Fancy factories, 13½ 13¾c.; good and prime, 13@13c.; fair lots, 11¾@11¾c.; poor, 10@10½c.; 7@10c., skimmed. Farm dairy, 12@13c. for good to prime; 11@12c. for fair lots; 8@11c. for skimmed; Western factory, cheddar, 13@13½c. for fine 11@12c. for good; 6@10c. for poor.

Exports for the week, 27,579 boxes.

Liverpool cable, 68s. Gold closes 101.

COTTON has been affected by the foreign news and has generally tended higher, with more of a stir to export demand.

Latest prices are for March, 10.03@10.89c.; April 11.09@11.13c.; May, 11 17@11.18c; June, 11.27@11.28c.; July, 11.35@11.36c.; August, 11.41@11.41c.; September, 11.24@11..5c.; October, 11.05@11.06c.; November, 10.91@10.92c.; December, 10.9.c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	8¼	8¼	8¼	8¼

Fair	12 11-16	12 11-16	12 13-16	10 13-16

Stained.

Good ordinary, 8 3-16c. Strict ordinary, 8 15-16c.; Low middling, 9 9-16c.; Middling, 10 1-16c.

DRIED FRUITS.—In apples the better grades of sliced and quarters have continued for home demand and rule firm; but the common qualities are dull. Peaches and small fruits generally on reduced stocks are rather more in favor of sellers.

Apples—State quarters, old, 5¼@5¾c.; new, 5¼@6¼c.; Western quarters, old, 6@6½c.; new 5¾@5¾c.; Southern, new, prime sliced, 7c.; fair to good, 5@5½c. Peaches—Peeled, new, 9@10c.; unpeeled halves, 4¾ 5c.; unpeeled quarters, 3¾@4c. Pitted cherries, 15@17c. Blackberries, 9@10c. Raspberries, 28c. Plums, 15c. and Southern at 12c.

EGGS.—Receipts for the week, 10,928 barrels. Lent as yet has given no marked impetus to the general demand, but holders look for an early enlargement of consumption. Prices have no snap; 14½c. is extreme for best Western marks or selected Southern. Fancy or extra fresh near points not above 15@16½c. Inferior or long-stored eggs which are the ghost of the market this season are freely offered at 10@13c.; Limed dull at 8@11c.

FEED.—Sales 40 pounds ave. $18.00@19.00; 60 pounds ave., $18@18.50; 80 pounds ave., $17.50@18.50; 100 pounds, $18@20; and rye at $18.50@19.50.

FLOUR.—With lower markets for wheat abroad, diminished export movement and large supplies, prices have been declining and closed weak.

Latest prices are $4.10@4.65 for poor to fancy superfine State; $4.75@5.10 for common to fair extra do; $5.15@ .50 for good to choice do.; $4.10@4.65 for superfine Michigan, Indiana, Iowa, &c., outside for choice; $4.75@5.10 for shipping extra do., the inside price for poor, and $5.15@5.50 for good to strictly fancy extra do.; common to choice white wheat extras, $5.75@6.65; fancy do at $6 6 @7.50; red and amber winter wheat, good to choice family, at $5.10@6.35; round hoop Ohio at $4 8%@5.25, and trade brands of do. at $5.10@6 75, the latter for choice; St. Louis, $5.25@6.10 for poor to fair extra and $6.10@7.00 for good to fancy, (with a few brands of very fancy quality quoted up to $7.25@7.50); Minnesota clear, $4.85@6.00; Minnesota "straight," common to fancy, at $5.60@6.75 and patent poor to very choice, $6.10@8.25, with a few fancy at $8 35@8.50; unsound stock at $2.35@5.75; city mill extra at $5 85@6.35 for fair to very choice for West Indies; do. for England $4 80@5.00; do. trade and family extras, $6.35@7 50; do. South America, $6.35@7.35 for fair to fancy; No. 2 at $2 65@3 75.

Corn meal is selling at $2.50@2.75 for Western yellow and $3.15 for Brandywine.

FRESH FRUITS.—The market for apples is weak; supplies are large for the season and demand especially as other cities are sending their surplus here. A full price for most prime Baldwins. Greenings and Russets is $5, other qualities range at $2.50@4. Stock sinks very rapidly of late when exposed. Cranberries have advanced; fancy bls., $9.00; good, $7.50; do. crate, choice, $3; good, $2.13@2.12; fair, $1.50@2.25. Florida oranges, $3 50@5.50—choice Indian River exceed the extreme. Peanuts weak but more activity is expected. Best hand-picked Virginia, $1 30@1.40; good to fancy, 85c.@$1.20. Hickory nuts not wanted even at 75c.@$1. Pecans, Texas, 8@10c. per pound. Hot-house strawberries $1 per quart.

FURS AND SKINS.—Market nominal and likely to be until the next London sales are heard from.

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₱ piece	$3 00@4 00	$2 00@2 50

Skunk, black		50@60
striped		7@30
Wolf, mountain		1 50@2 00
prairie		50@60

Southern raw skins are worth 20 per cent less than Western.

GRAIN.—There has been a depressed, unsettled, and lower market with the weak foreign advices, and very limited export movement

Latest sales are of No. 2 red at $1 22@— ungraded red and amber State, $1 32@—; white, $1 40; No 1 Northwest spring, $1 27; No. 3 Chicago, $1 22½; No. 2 red for March at $1 21½; No. 2 Milwaukee spring, $1 27. Rye is a trifle steadier; sales of Western at 71@73c.; State at 53@7 c. Barley 66c for No. 1 Canada; 85@86c. for six-rowed State. Corn is weak and quiet. Latest sales are of New York No. 2 at 55½@56c.; steamer mixed, March, 52c. Oats of New York extra white, at 36½@38½c.; do. No. 1, July, 35½c.; No. 2 white, 35½c.; mixed Western, 35½@36c.; white Western, 36@38c.

HAY AND STRAW.—The comparatively easy prices for prime stock have at length led to a much freer demand, and the market now favors sellers a little. For shipping grades inquiry continues and steady prices are made.

Bale hay, 65@70c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 45@55c. for long rye; 45@50c. for short rye, and 40@45c. for oat.

HIGHWINES are higher—$1.08½@1.09 regular.

HOPS.—The arrivals continue fair, and the export demand has fallen off, only about 800 bales shipped this week. The English advices are dull, and prices here are a little weak, especially for the low grades. State choice to fancy, 10@14c.; good to prime 8@10c; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Californians, 12@14c.

LEATHER.—Hemlock sole, 20@21½c. for light, 20@21c. for middle, 20@21c. for heavy, 18@19c. for good damaged.

MAPLE SUGAR.—There is more activity; late Ohio receipts are of fine quality; large molds, 12@14c.; small cakes, 13@15c. Syrup, $1@1.50 gal., with can.

OIL-CAKE.—Western is quoted at $41 ₱ ton and $30 bid.

POULTRY AND GAME.—Considerable quantities of live have gone to Havana, and the market has felt the good effect of the additional demand. Exports of live chickens and fowls are to be an important branch of the poultry trade.

N. J. chickens, 10@11c.; W. fowls, 8@9c.; Turkeys, @10c.; Toms, 6@8c.; Ducks, N. J., pair 87@$1.12; Geese, N. J., $1.75@2.00; Western, $1.12@1 50.

The arrivals of dressed are light but they supply the small wants of the season. Large turkeys not worth shipment. Poultry frozen for spring is said to have kept badly.

Fancy Phila. and N. J. turkeys, 12@14c.; good, 8@ 6c.; large or Toms, 7@9c, chickens, choice, 8@9c; good, 11@13c.; common, 6@7c.; ducks, choice, 12@13c.; other, 13@14c.; geese, fancy, 11c.; other, 7@9c. Capons large 18@20c, small and slips, 15@16c.

In game warm weather restricts the demand but the supply is moderate and prices are fairly firm.

Hares and rabbits, pair, 20@25c, Canvas-back ducks, $1.25@1.40; Red-heads, $1.50; Mallard, 60@75c.; Teal, 30@50c.; Quail, prime, $ .75@3.00; soft, $2.25@2.50. Partridges, pair, 75c.@$8.c. Grouse, $1.00@1.50; poor, 9.c.@$1.10.

PROVISIONS.—There has been a sharp decline and a generally deferred and unsettled market. Stocks are liberal here and at the West, and the arrivals of hogs continue beyond expectations, and there have been free sellers.

Mess pork, $10@10¼ for spot lots; $10.00 @ 11.10 for March and April. Bacon at 5 1-16c. for long clear and 5¾c. for short clear. Lard—Western steam at 7-20c. for spot, 7-17½c. for March, 7-20@c. for April, Tallow at 7 9-16c. for prime. Stearine, 7¾c. for prime Western. Beef hams at $16.50. Beef—New extra mess, $12.00 @12.50; plain, $11.00@11.50; new packet, $14.75; family mess, $17 50; extra India mess, $27 for city brands; do. Philadelphia, $26.00.

SALT.—Ashton's at $2 50; Higgins', $2.40 and other sack lots at $1.05@1.20; Liverpool ground, 60@65c.

SEED.—Clover, 7¾@8¼c. for Western; 7¾@8¼c. for State. Timothy, $1.25@1.35. Rough flax, $1.50.

SUGAR.—Refined at 10c. for cut-loaf; crushed, 9¾c.; powdered, 9¾c.; granulated, 9¾c.; soft white, 8¾@9c.; soft yellow, 7¾@8¾c.

TOBACCO.—Export trade has been light but there is increased demand from the home trade.

KENTUCKY LEAF.

	Light.	Heavy.
Common lugs	3 @ 3¼	3 @ 3¼
Good lugs	3¾@ 4	4 @ 4½
Low leaf	5 @ 5½	5 @ 6½
Medium leaf	6 @ 7	7 @ 7½
Good leaf	7¾@8½	— @—
Fine leaf	—@—	— @—
Selections	—@—	— @—

VEGETABLES.—Potatoes are dull and tending lower; prices 2½c. off from last week. The demand for seed has subsided. Onions dull and weak. Florida green peas again arrived worthless.

We quote Peach Blows $1 50@1.75, bulk and double-heads. Early Rose, $1.62@1 87; Peerless, $1 25@ 1.50; Nova Scotia, $1 90@2.00; Sweet, $2.25@2.50. Cabbages, 100, $3.00@4.00; red, 5@6. Marrow squash, bbl., $1.50@2; Hubbard do., $2.00@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 62@75c. Red and yellow onions, $1.00@1.25; white $1.25@1.75. Celery, doz., 75c.@$1. Hot-house mushrooms, ₱ lb., 20@40c. Radishes, 100 bunches, $1@1.50. Lettuce, small, dozen, 75c.; large, $1.00@$'. Cucumbers, doz., $3@3. Rhubarb doz., $1 Spinach, Southern, $1 75@ @2.25 ₱ bbl. Bermuda, $4.50@5.

WOOL.—There has been a little pressure to sell most grades, with slightly easier prices, on account of the late period of the year; the fact that manufacturers have been buying sparingly on account of the slow movement in the goods market and the pretty full stocks.

Ohio, Pennsylvania and Virginia—XXX and picklock, 45@47c.; XX, 42@44c.; X, 40@42c.; No. 1, 42@43c.; No. 2, 36@38c.; common, 33@35c.; combing, 50@75c.

New York, Michigan, Indiana and Wisconsin—XX, 35@ 8c.; X, 38@37c.; No. 1, 38@ 40.; No. 2, 33@36; common, 32@34c; combing, 50@52c.

Iowa, Vermont and Illinois—X and XX, 31@36c.; No. 1, 36@39c.; No. 2, 32@34c; combing, 46@50c.

Missouri, Kentucky, and Tennessee—Washed fleece, 35@40c.; unwashed, 25@30c.; unwashed combing, 34@37c.

LIVE STOCK MARKETS.

NEW YORK, March 11, 1878.

BEEVES.—Receipts for the week, 7,813 head; do., last week, 8,998 do. There is quite an unusual falling off in the demand for meats—dull times and Lent making a severe combination for dealers. Prices at the cattle yards are firm, and the closing rates are quite as low as at our last, being 7¾@10c. for ordinary to picked steers. These prices have not been exceeded during the week.

COWS AND CALVES.—Market more than supplied. The nominal quotations are $40@60 ₱ head for good to choice.

VEAL CALVES.—Not enough live have arrived latterly to establish new rates. Recent rates, 5@7¾c Hog-dressed are neglected, as the weather has been against them—6@9c.

SHEEP AND LAMBS.—Receipts for the week, 17,077 head; do., last week, 15,725 do. Receipts continue light, but seem fully equal to the demand, the market, as a whole, seeming weak. Quotations for sheep, 6¼@6¾c. ₱ lb.; choice State lambs, 7c.

SWINE.—Receipts for the week, 27,522 head; do. last week, 32,412 Country-dressed pork—State and New Jersey, 4@5¼c.; Western dressed, 4¼@5c.; city, 4½@5c. Live hogs, 3¾@4c.

SPECIAL NOTICES.

The Press is published at Middletown, N. Y., a thriving village sixty-six miles from New York City on the Erie and Midland Railroads. It is an old paper, the Weekly having been established in 1850, and the Daily in 1869. The circulation of the Weekly is a little over 2,300, and the Daily 1,000, both circulating among the well-to-do farmers and business men of the county. These numbers are actual, and only include pay-in-advance subscribers. The Weekly PRESS is also the largest paper in the county.

For information about Kansas lands, &c., address "NEWS," Hutchinson, Kas.

As an advertising medium, THE DEMOCRAT, published at Belleville, St. Clair Co., Ill., should not be overlooked. The county is populous and wealthy, and the paper enjoys a large circulation among the best people. Deal with us directly.

DENLINGER & RUSSELL, Publishers.

Families desiring to locate in a *good* Western town, or to learn about Northeastern Iowa, should send for THE WAUKON STANDARD, published at Waukon, Iowa, by MAY & HANCOCK. $1.75 per year; $1 for six months.

The Ronn Mountain Republican is an enterprising journal, published at Bakersville, N. C., in the heart of the mica mines, and is an admirable medium for those wishing to reach an active mining, manufacturing and agricultural community.

For a sure and rapid growth of Hair upon Bald Heads and Smooth Faces, use COSMETIC PREPARATION. Price 50 cents. Send for Circular.

Reading for the Young.

ROCK-A-BY, BABY.

"Rock-a-by, baby, in the tree top,
When the wind blows the cradle will rock;
When the bough breaks, the cradle will fall,
Down tumbles baby, and cradle, and all."

Rock-a-by, baby; the meadow's in bloom;
Laugh at the sunbeams that dance in the room;
Echo the birds with your baby tune,
Coo in the sunshine and flowers of June.

Rock-a-by, baby; as softly it swings,
Over thy cradle the mother love sings;
Brooding and cooing at even or dawn,
What will it do when the mother is gone?

Rock-a-by, baby; so cloudless the skies,
Blue as the depths of your own laughing eyes;
Sweet is the lullaby over your nest,
That tenderly sings little baby to rest.

Rock-a-by, baby; the blue eyes will dream
Sweetest when mamma's eyes over them beam;
Never again will the world seem so fair—
Sleep little baby—there are clouds in the air.

Rock-a-by, baby; the blue eyes will burn
And ache with that your manhood will learn;
Swiftly the years come with sorrow and care,
With burdens the wee dimpled shoulders must bear.

Rock-a-by, baby; there's coming a day
Whose sorrows a mother's lips can't kiss away;
Days when its song will be changed to a moan;
Crosses that baby must bear all alone.

Rock-a-by, baby; the meadow's in bloom,
May never the frosts pall the beauty in gloom;
Be thy world ever bright as to-day it is seen,
Rock-a-by, baby; "thy cradle is green."

[*Burlington Hawk Eye.*

PERSEVERENCE.

M. F. BERNE.

It is of no use, Theo, I can't study; how can any one be expected to, this hot weather? how I wish summer was over, and I was free from books!"

And Clementine Gresham, pushing back the mass of golden hair from her heated brow, sent the large history spinning across the room, and threw herself on a couch.

"Never mind, Clem, only a month longer, and this examination is something quite extra and unusual, you know."

The speaker was Theodora Gresham, a young girl of about nineteen years; she was bending over a large painting in oils, on which she seemed to be bestowing an unusual amount of care. The two girls were sisters, and were now completing their education. It was twelve months since they had left boarding-school, and since that time they had been taking occasional lessons at the large college near their home.

But now the energies of all the young students were bent on preparing for the grand examination. It was Mr. Gresham's special wish that his daughters should compete for the various prizes. Theo was competing for one prize only, that of a painting; the prize for this department was much coveted. Clem studied first one branch and then another, until her friends almost gave up hope of her succeeding in anything. On this afternoon Theodora had to listen to many complaints of the weather, the books, the examination, and indeed, of nearly everything which Clem talked of.

"It is so horrid," she said, picking up her discarded history; "to think there should be anything like books or drawing in the world. If it wasn't for papa, I'd"—but suddenly catching sight of her dog Fido, making havoc among the tulips, she flitted out through the open French window, leaving Theo in peace.

The face that was bent over the painting was a very lovely one, with its delicate complexion, and eyes of softest, darkest gray. Her hair, which was soft and very dark, was allowed to rest in natural wavelets on the fair brow; this afternoon it was slightly ruffled, and her cheeks were flushed, for she had been bending closely over her easel since mid-day. She rose when Clem left the room, and retreating a little, gazed at the painting, not yet half finished. She had chosen for her subject "Autumn," represented by a maiden with nut brown hair streaming over her shoulders; she wore a russet dress, and a wealth of brilliant leaves, while around her were piled rosy apples, clusters of grapes, and glowing berries.

"If only I can do it justice," murmured Theo, as she again bent over the easel.

It was a few days later, and a brilliant morning; earth seemed basking in its young summer loveliness; it was a morning to tempt one to leave all duty, and wander off in the cool green woods, carpeted with blue-bells. Clem burst into her sister's room with sparkling eyes.

"Theo, what do you think? the most delightful thing imaginable, a pic-nic to Beverly Woods, wagons to start at eleven, make haste and get ready."

"Why do you ask me, Clem, dear," said Theo, gently; "you know that I cannot spare a day; my painting is not half completed, and in three weeks it must be ready."

"Theo, you are the most tiresome girl in the whole world," exclaimed Clem, petulantly; "I know why you are trying so hard; it is all because you think Hugh Stanley will admire you more, and I can tell you he will not, although he does preach so much about perseverance, and all that nonsense; however, perhaps you will alter your mind when I tell you he is going to-day."

Was there a moment's hesitation, a slight wavering in Theo's mind? If so, it was but momentary.

"No, dear," she replied firmly; "it can make no difference; do not wait longer; you will be late."

In another minute Clem was downstairs and out in the sunshiny garden. Theo, looking through the window, saw that Hugh Stanley was waiting at the gate.

"Your sister not going?" came clearly to her ears, borne upon the still summer air, and Clem's reply, more clearly still:

"Oh, no; she says she doesn't care to go."

A few silent tears hastily brushed away, and Theo soon became entirely engrossed in her work. And all through the glowing June days, when the earth lay bathed in golden sunshine, and no cloud crossed the blue arch of heaven, she worked on steadily and constantly, allowing no party of pleasure to tempt her from her task.

The 22nd of June arrived, and Theodora remained shut up in her studio all day; the painting must be sent in by seven in the evening, and she had to put a few finishing touches; at five o'clock she called her mother and father and Clem; the painting was finished. Very warm and loving were the praises bestowed by Mr. and Mrs. Gresham on their daughter's handiwork. Clem, after her first involuntary exclamation of admiration at the beautiful painting, stood silent; she was thinking what Hugh Stanley would think of it, and of Theo, and thinking, too, of her own neglected studies, and of how she should get on on the morrow.

Two days were given to the grand examination, the first to history and other general subjects, the second to French, and the prize awarded for painting. Poor Clem was very unsuccessful.

"I was ever so low on the list," she said to Theo, dolefully, on the evening of the first day. "I wish I had never tried; I can't bear learning."

"Clem has no perseverance in her," Mr. Gresham said to his wife that same evening.

"I fear not," she replied; "if only she had applied herself more!"

At two o'clock the following day, one hundred and fifty young girls were gathered in the large hall, where the prize award for painting was to be made. The side seats were occupied by the friends of the competitors, and at the top of the hall were seated the patrons of the College, and a few eminent artists—Hugh Stanley among the number. On the platform, which was draped with crimson, and decorated with evergreens and rare exotics, sat the President with his fair daughter, Edith. Many hearts beat quicker, and many faces flushed, as the President arose. Theo, sitting nearly at the back of the hall, was calm and collected; she had not the slightest hope of winning; to have her name honorably mentioned was all she expected. The President made a long speech, and a very clever one; a dead silence reigned in the hall, and his closing words were distinctly heard.

"The winner of the first prize for the best executed and well-finished painting in oils, is declared to be Theodora Winifred Gresham; will the young artist advance."

Perhaps it was close application during the past weeks, or the utter surprise of the moment, but Theo's face turned as white as the dress she wore, and a mist arose before her eyes.

"Go up, quickly," she heard her companion whisper, and mastering the feeling of faintness by a strong effort, she passed quietly up the hall to the platform where Miss Edith stood, with the set of brilliantly bound volumes and the gold medal in her hands. Theo paused an instant to hear the President say in kindly tones, "All accomplished by talent and perseverance; my dear child you must have worked hard, and I congratulate you most sincerely." And raising her eyes in that large assembly, Theo saw the sweet smile bent upon her, the smile she valued of all others, that of Hugh Stanley. The ladies and gentlemen and young girls all left their seats and crowded around the successful young artist until the slight figure in flowing white, with the heliotropes in her dark hair, was the center of a throng, receiving their congratulations and praises with her winning smile and sunny face.

* * * * * * *

The sweet June twilight fell; the air was heavy with the rich fragrance of flowers; the stars came out in the clear summer sky, and the queen of night arose, looking lovingly down on two who were yet lingering under the chestnuts, while the old old story was whispered once more on this eventful midsummer night.

And later, as Theo hid her crimson face on her mother's shoulder, and in low tones told of her new happiness, Clem stole softly in, and with tearful eyes kissed her sister again and again.

"Forgive me, darling, for all my jealousy and cross-temper," she whispered; "I hope you will have all the happiness in the world; and, Theo, if there is ever another examination, I mean to show the same perseverance that you have, and perhaps I shall receive the same reward."

HEAVIER THE CROSS.

Heavier the cross, the nearer heaven;
No cross without, no God within—
Death, judgment from the heart are driven
Amid the world's false glare and din.
Oh! happy he with all his loss,
Whom God hath set beneath the cross.

Heavier the cross, the better Christian;
This is the touchstone God applies.
How many a garden would be wasting,
Unwet by showers from weeping eyes!
The gold by fire is purified;
The Christian is by trouble tried.

Heavier the cross, the stronger faith;
The loaded palm strikes deeper root;
The vine juice sweetly issueth
When men have pressed the clustered fruit;
And courage grows where dangers come,
Like pearls beneath the salt sea foam.

Heavier the cross, the heartier the prayer;
The bruised reeds most fragrant are;
If sky and wind were always fair,
The sailor would not watch the star;
And David's psalms had ne'er been sung,
If grief his heart had never wrung.

Heavier the cross, the easier dying;
Death is a friendlier face to see;
To life's decay one bids defying,
From life's distress one then is free.
The cross sublimely lifts our faith
To Him who triumphed over death.

Thou Crucified, the cross I carry,
The longer may it dearer be;
And lest I faint while here I tarry,
Implant Thou such a heart in me
That faith, hope, love, may flourish there,
Till for the cross my crown I wear.

[*From the German.*

VOWS.

GRACE GOLD.

The psalmist says:—"I will pay thee my vows, which my lips have uttered, and my mouth hath spoken, when I was in trouble." As I read these words, I thought how many of us when prosperity smiles upon us, forget to pay the vows we made *when we were in trouble.* How easy it is when the dark clouds of adversity hover about us, and it seems as though every earthly friend had forsaken us, and we must look to God alone for assistance and sympathy, how easy it is then to make vows unto the LORD; and, as we utter them we feel them, and GOD, more willing to trust us than we are to trust Him, often restores us to a position where we can fulfill them. Then, ah, then do we remember how faithfully we promised to perform all that our lips had uttered? Do we remember how we pleaded with God to lift the clouds that overshadowed us, and remove the burdens that seemed to weigh us to the very earth, and we would perform all that our mouth had spoken? Alas, we fear too many *forget* to pay the vows they made when they were in trouble.

I remember once making a vow unto the LORD, that if he would give me a certain desire, though I must confess to my shame that I did not believe it would come to pass, for I could not believe such happiness would be mine, but I promised the LORD what I would do, and He, taking me at my word, gave me the desired position. Then came the struggle. For a time it seemed that pride would triumph over grace but at last, thanks be unto God and the angels, grace triumphed. I was enabled to perform all my vows; and much good was done in the name of the LORD. Dear readers, have you performed unto the LORD all your vows? If you have not, think not you will prosper, though you seem to for a season. For it is better *never* to vow, than to vow and not perform, for the LORD will surely require it at your hand.

CHRISTIAN FELLOWSHIP.

ACTS XX. 6-12.

ST. PAUL and his fellow-disciples were so deeply interested in their meeting that they could not bear to break it up, not knowing when in the providence of God they would again be together. Together they held sweet communion upon the precious truths and glorious realities which cluster around the person of Christ; together they knelt in prayer, seeking spiritual and eternal blessings for themselves and others; together they commemorated their Saviour's dying love, and felt their hearts knit in a closer bond of union to each other and to their common Lord. Well might the disciples, in the enjoyment of such rich privileges, forget the flight of time! To them the hours were not heavy-footed, but, winged by faith and love, bore them upward until they could almost catch a glimpse of the heavenly Jerusalem and of the lamb who is the light thereof. Such seasons are the Christian's heritage even in this life, and are a foretaste of the full, deep, perfect joy which awaits him when he sits down at the marriage supper of the Lamb—

"When the saints of all ages in harmony meet,
Their Saviour and brethren transported to greet;
While the anthems of rapture unceasingly roll,
And the smile of the Lord is the feast of the soul."

Christian fellowship, or the communion of saints, is, next to communion with Christ, the source of the purest happiness we taste on earth. By mutual counsel and sympathy, Christians lighten each others' burdens, and encourage each other to press on in their pilgrimage heavenward. And when separated in the flesh, they are still united in spirit, one in Christ for ever and ever. Though oceans roll between, there is one spot on earth where they can meet—the throne of grace. Their voices may not mingle, but their hearts can ascend even as one, with and for each other. And when God calls His children home, one by one, the link which binds the believer on earth to the believer in heaven is not broken only hidden for a season by the veil which shuts out heaven from mortal view. Earthly ties may be dissolved, friends may change or grow faithless, but every link of the chain which unites Christian hearts together will grow brighter and stronger throughout the ages of eternity, fastened as it is to the throne of God, and cemented by the love of the same crucified yet Divine Redeemer.

PERSONAL ITEMS.

The late Pope Pius IX. was once in this country. He was shipwrecked on the North Carolina coast, near where the Metropolis and Huron disasters occurred, and just before the wreck of his vessel, put into Norfolk for water.

Colonel Forney was at the Stanley banquet in London, and, speaking of the Prince of Wales's speech, says: "What a fine, hearty, clear elocution he has! Altogether English, yet without affectation, he captured everybody; and he looked well."

A Washington correspondent says that Senator Davis and Judge Clifford are fast friends, as are their wives. They occupy one table, and are together a great deal. Judge Clifford has, like Davis, a smooth face, small eyes and large nose. His hair is straight and brown, and parted smoothly on the side, like his friend's. He is not quite so large as Judge Davis, and is neater looking, and has a more formal, old-school manner.

Trees, Seeds, Plants, &c.

To Buyers of Seeds.

HOVEY'S ILLUSTRATED SEED CATALOGUE

Our Annual Catalogue and Priced List of Seeds is now ready and sent free to all our customers, without writing for it, and to all others inclosing stamp for postage. SPARKS AND SPLINTERS.

WHEN a man wants to call a puppy he whistles, but a girl just walks along with her handkerchief floating across her shoulder.—*Rome Sentinel.*

A GENTLEMAN coming into the room of the late Dr. Barton, told him Mr. Vowell was dead. "What!" said he; "Vowel dead? Let us be thankful it was neither U nor I."

FIND a man who has just seen his girl waltzing with another fellow, and in every case you will discover him to be an ardent admirer of Mrs. General Sherman.—*Louisville Argus.*

Among the Dead Failures

Of the past, how many bogus nostrums may be numbered! Beginning their careers with a tremendous flourish of trumpets, blazoned for a time in the public prints and on flaming posters, soon, but not too soon, were they relegated to the limbo of things lost on earth. But Hostetter's Stomach Bitters is a living and thriving remedy. It goes on, curing and to cure. Neither underhand nor open competition affect it. On the contrary, contrast with inferior rival preparations only increases its popularity. It has been repeatedly imitated, but without success. Counterfeits of it have been surreptitiously introduced, but have fallen flat. Everywhere it entrenches itself in the confidence of the people; and well it may, for it is a thoroughly reliable invigorant of the feeble, banishes dyspepsia and constipation, braces the nerves, cures rheumatic ailments and kidney complaints, and eradicates and prevents intermittent and remittent fevers.

The Man who never could see anything in them Agricultural Papers, nohow.

BLISS' SELECT GARDEN SEEDS

$250 in Premiums.

PRINGLE'S NEW HYBRID SPRING WHEATS.

CHAMPLAIN.—A bearded variety—a cross between the Black Sea and Golden Drop. Its strong and vigorous straw, growing 6 to 12 inches higher than its parent varieties, stands erect, frequently bearing heads from 5 to 6 inches in length, containing from 60 to 75 kernels each.

Price, $1 per lb.; 3 lbs., $2.50, by mail, post-paid.

DEFIANCE.—Another variety of the highest promise, which displays great productiveness, vigor and hardiness. It is a beardless, white chaff wheat, with heads frequently 5 to 6 inches long, very closely set with large white kernels, frequently numbering 75 to 80 to the single head.

Price, $1 per lb.; 3 lbs., $2.50, by mail, post paid.

In order to induce Wheat Growers to give these new sorts a thorough trial, we offer **$250 in premiums** for the largest quantities grown from 1 lb. of seed, also for the 20 largest heads. For particulars see Circular.

Two New Varieties of Potatoes.

BLISS' TRIUMPH.—An extra early variety, ripening a week to ten days earlier than the Early Rose—and one of the most attractive in appearance. Superior quality and very productive.

TROPHY.—A new and exceedingly fine, medium early, red-skinned variety, resembling the Snowflake in appearance and quality. It might with propriety be called a Red-Skin Snowflake.

This variety was exhibited in London at the great International Potato Show, in October last, and received a first-class certificate.

Price of each, $1 per lb.; three lbs. to one address, $3.50, by mail, post paid. See Potato Catalogue.

Bliss's Illustrated Seed Catalogue and Amateur's Guide to the Flower and Kitchen Garden, 220 pages, including several hundred finely-executed engravings, and a **beautifully-colored Lithograph. 35 cents.**

Bliss's Illustrated Handbook for the Farm and the Garden, and abridged Catalogue of **Garden, Field and Flower Seeds, Fertilizers**, Agricultural Implements, etc., etc. One hundred pages, many illustrations, 3 cents.

Bliss's Illustrated Catalogue of Plants, for the Greenhouse, Conservatory, Lawn and Flower Garden, and

Bliss's Illustrated List of Novelties for 1878, mailed free to all. Address

B. K. BLISS & SONS,
34 Barclay Street, New York.

THE THREE POTATOES

EARLY OHIO.—Earlier than Early Rose. Ranked by general consent, in earliness, yield and quality combined, at the head of all the early potatoes.

BURBANK.—Medium late; a prodigious cropper; flesh remarkably white; quality excellent.

DUNMORE.—A splendid late sort. A greater cropper than the Peerless, which it resembles in form, while far better in quality.

Each, per Barrel, $4.00; per Bushel, $2.00; per Peck, 75 cents.

My Illustrated Seed Catalogue *free* to all applicants.

Floricultural.

EULALIA JAPONICA VAR. ZEBRINA.

We are glad to place before our readers at this time a fine picture of the Zebra-striped Eulalia, to which we have several times referred, during the past year, in commendatory terms. The inflorescence is set in a black background in order to show by contrast its feathery plumes, but otherwise the figure does not exaggerate the beauty of this Grass. Our own specimen did not bloom last year, but though the plant was very small when set out in the spring, it made a growth of three or four feet, presenting, in every leaf, a creamy-white and green variegation correctly expressed in our illustration.

There is a longitudinal striped Eulalia that has been known among us for eight or ten years, introduced by Mr. Hogg. The present variety, also introduced by Mr. Hogg from Japan, has been offered by florists and nurserymen only during the past year, and is far from being generally known.

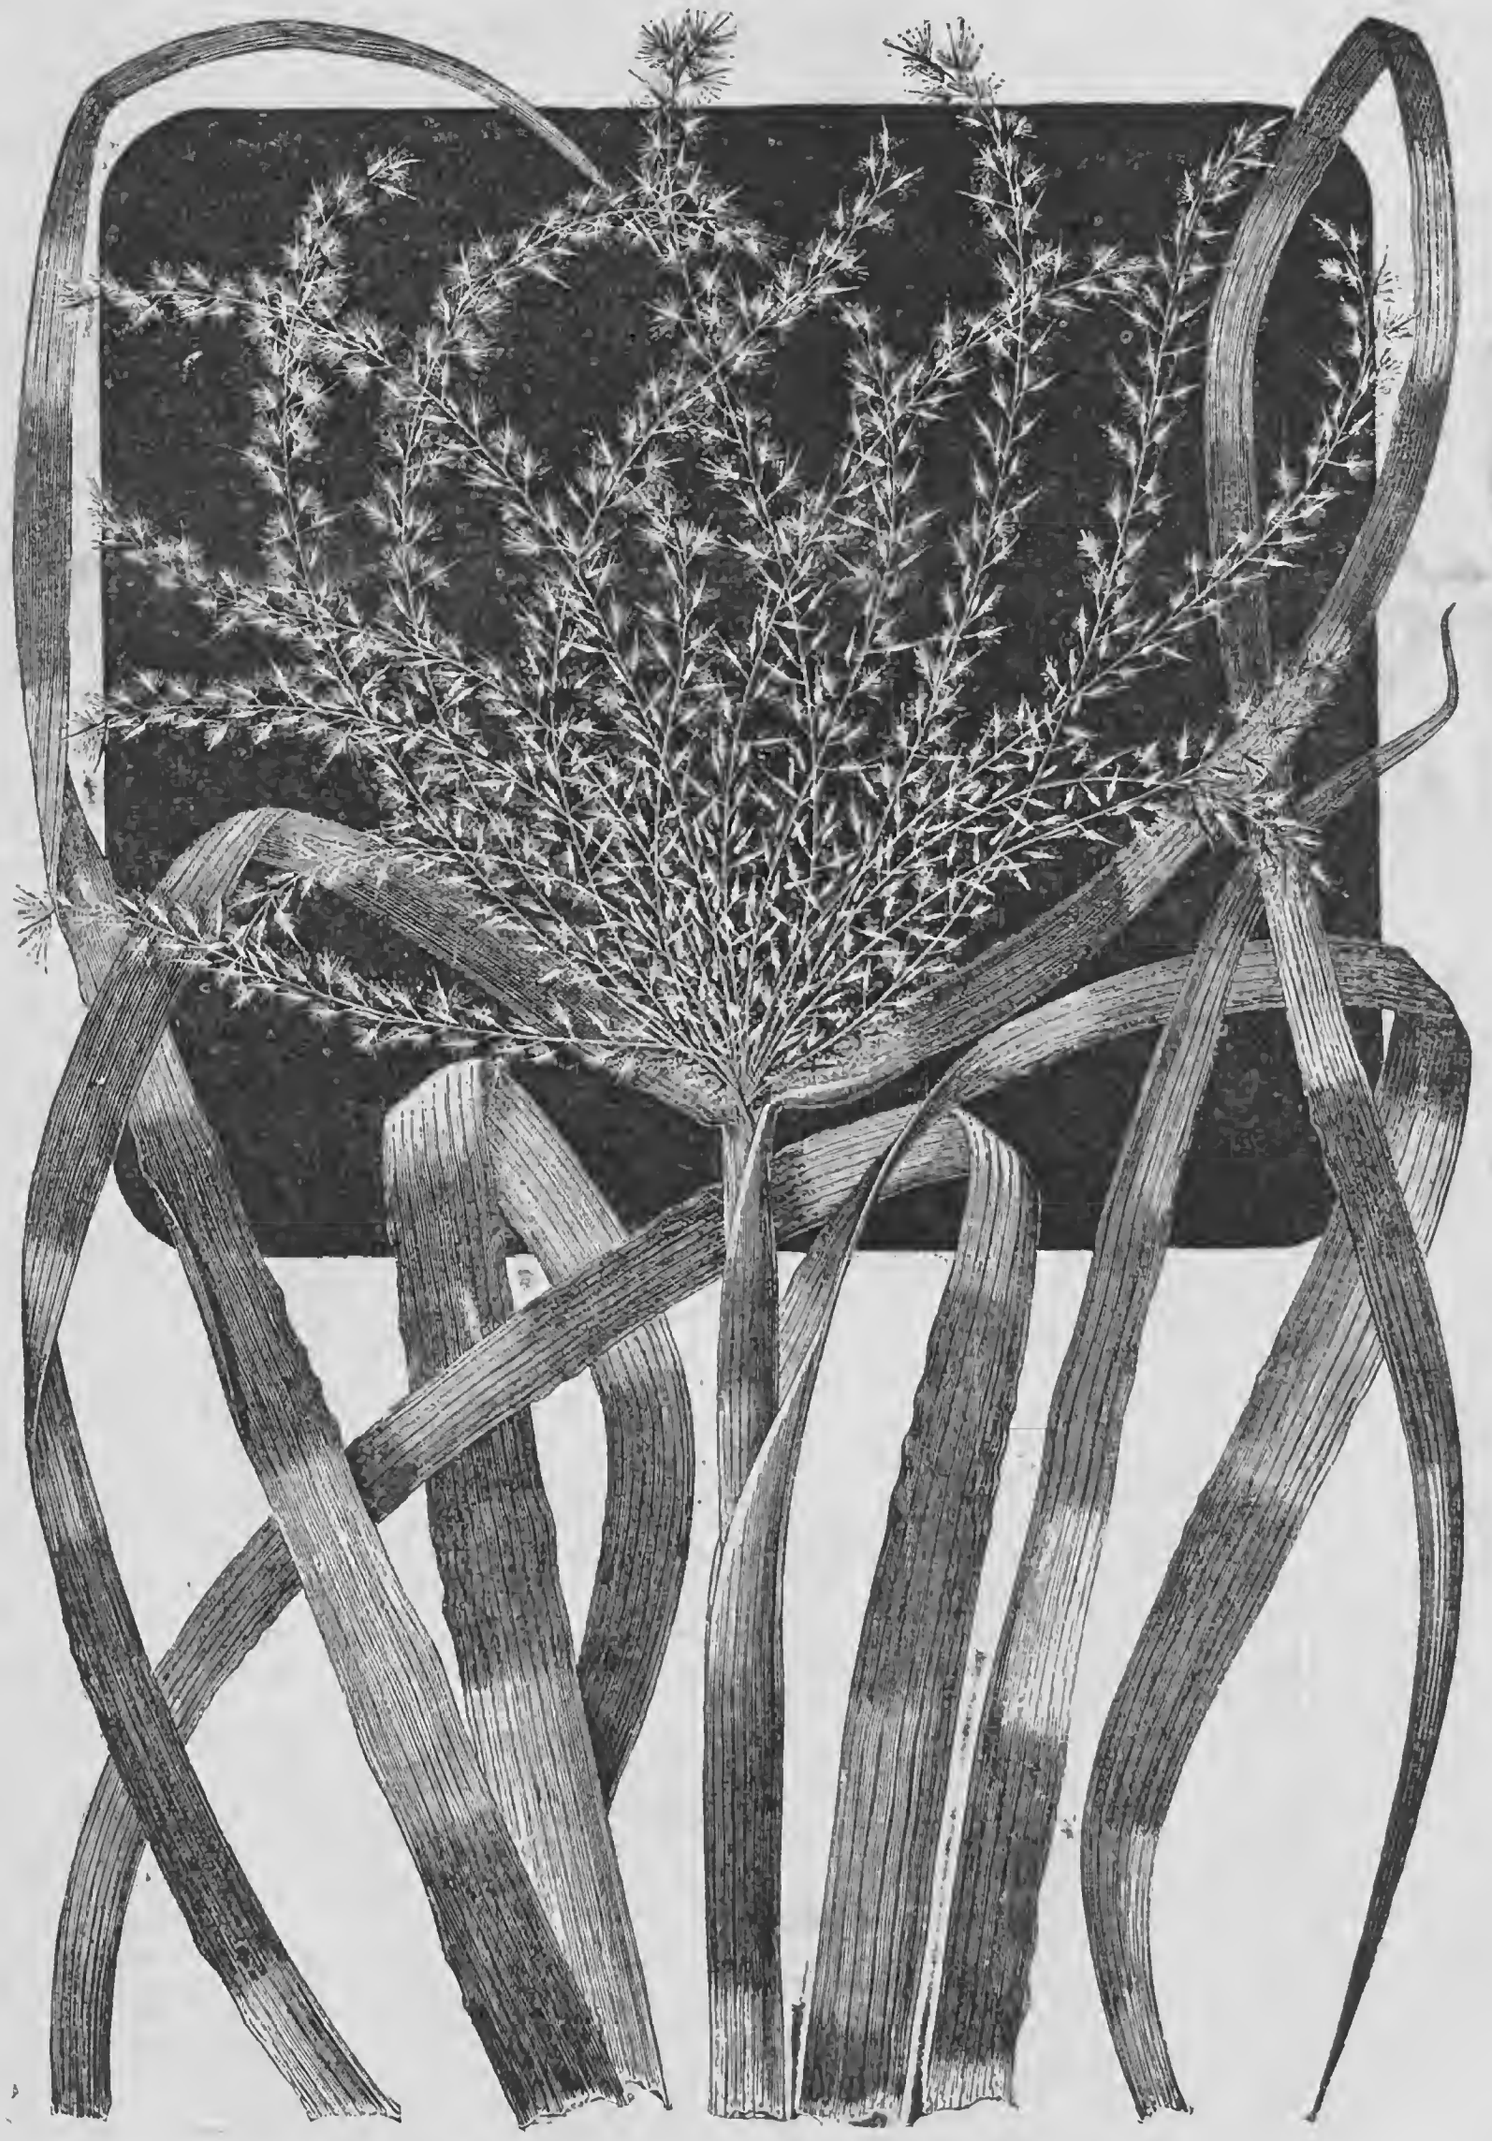
There is scarcely any doubt that it is hardy in this climate, and perhaps it will stand a severer one, though the mildness of this winter has not enabled us to speak positively from our own experience. This point settled, however, we should prefer the Zebra-striped Eulalia to any other large-growing Grass with which we are acquainted, and we suggest to our readers that they include a specimen in their spring orders. Our illustration is taken from one in the Gardeners' Chronicle of London, which was drawn from a specimen plant furnished by Mr. Wm. Bull of that city.

SHELL FLOWER.

We wrote to Mr. Robinson, editor of the London Garden, to learn if Moluccella lævis (Shell Flower) was known in England, and if so, why it was not cultivated. The following reply explains itself. The plant needs a hot sun and dry weather to do well, for which reason we think it may be more desirable here than there:

"In Mr. Robinson's absence I beg to acknowledge receipt of yours of the 15th ult., and to state that I have known Moluccella lævis for some eighteen years at Kew, where I was about 1860, at which time Dr. Hooker made a trip to Syria and Asia Minor, and brought home seeds of the Moluccella, which we raised. We continued to grow the plants, but I failed to notice any beauty in them — being more curious than beautiful. Yours, truly, T. Spanswick,

"Publisher 'The Garden.'"



EULALIA JAPONICA VAR. ZEBRINA.

The Garden.

ASPARAGUS BEDS.

Mix a goodly quantity of old manure with the soil of the bed to the depth of eighteen inches. The quantity of manure to be used need be measured only by the quantity that can be spared—for there is no danger of making the soil too rich. Bone, wood-ashes, salt, lime, &c., are all good. Then open trenches six inches deep and, spreading out the roots, place the plants at least a foot apart. The crowns will then be about three inches below the surface. The old practice of planting very deep in order to procure white shoots is now abandoned, though it required a long time to ascertain that such shoots possessed little of the rich, marrowy flavor of those exposed to the light. Make the trenches (that is for the garden,) from one foot to eighteen inches apart. Bed may be laid out five or six feet wide with paths between, so as to prevent tramping upon the soil which should always be mellow. When it is desired to raise Asparagus in large quantities for market, the rows must be made four feet apart that the plow may be used. The productiveness of Asparagus is much impaired by cutting for too long a time. A bed made as above described, will last for many years, needing only a light spring dressing of salt; which however, as with the manure at first used, may be applied without fear of injury and will at least serve to keep weeds down. Seed may be sown as soon as the soil can be worked. Rake the seed bed smooth and sow the seed in drills, a foot apart. One ounce of seed will suffice for five drills ten feet in length.

Thin the plants, when well up, to three inches apart. Keep free from weeds during the summer and dress with manure in the fall. Such plants may be transplanted to a permanent bed or left in the seed-bed a second year. If strong plants only be transplanted, the permanent bed may be cut from the second year thereafter.

Asparagus beds prepared as we have directed need a large quantity of manure—but they will last for a lifetime. They may be prepared with very little manure so that the soil is light and well drained and the exposure sunny. Then in the fall, cover with manure, and rake off the littery part in the spring.

Asparagus Roots and Seeds.—The best variety of Asparagus is that known as Conover's Colossal. It is sold by all good seedsmen — the seeds for ten cents per ounce or fifty t sixty cents per pound, th roots for one dollar per one hundred.

Horticultural.

MAHALEB STOCKS FOR CHERRIES.

WM. H. HART.

As the time for tree-planting approaches, I wish to give my rather unfavorable experience in regard to the use of the Mahaleb stock in propagating so-called "standard" cherry trees. I have several hundred trees, mostly of the Morello class, worked upon the Mahaleb stock, and in bearing—and as these are alternate with similar trees worked upon Mazzards set under similar conditions, the comparison between them is a fair one.

The Mahaleb stock is peculiarly liable to the attack of a worm at the root, very similiar to that infesting the peach tree, (perhaps our entomologists can tell us whether it is the same species) and although it is held that constant vigilance and the knife are the sure and only remedies in the case of the peach worm, yet with the Mahaleb my experience seems to indicate that the most faithful attention one can give it in this respect only lessens the evil, without removing it. The worm rarely attacks the Mazzard stocks except in the close neighborhood of infested Mahalebs. If the latter stocks were in other respects much to be preferred, the disagreeable operation of careful examination twice a year might insure a fair measure of success. But on our light soils, adapted to the Mazzard stock, I firmly believe it is folly to plant a tree worked on anything else than the Mazzard.

I write at this season to call timely attention to the practice, by many reputable growers of nursery stock, of recommending "standard" trees worked upon the Mahaleb as being hardier and better than those upon Mazzards—or even filling orders for standard Cherries with such trees without consulting the wishes of their patrons. As regards hardiness, with me the fruit-buds of trees upon Mazzard stocks are injured rather less by cold than those upon Mahalebs. Moreover, the union between our improved Cherries and the very dissimilar Mahaleb stock is so imperfect that I question the expediency of its use at all with any varieties except those of the Morello class, which succeed best upon it.

The point of the whole matter is this: trees of more handsome appearance can be grown with less expense and in shorter time upon the Mahaleb stock than upon the legitimate Mazzard; and so long as this is the case, growers of cherry-trees will try to persuade themselves and their patrons that this weakly Mahaleb stock, used so many years simply for dwarfing the Cherry—and I admit it is well adapted for that purpose—will sustain and nourish the life of a standard cherry-tree longer and better than its own species, the healthy and vigorous Mazzard.

Trees worked upon the Mahaleb stock, if sold at all, should always be specified as such, and put at a lower price proportionate to their ease of propagation. Dealers who put off such trees upon their uninformed customers commit gross injustice upon them.

Poughkeepsie, N. Y.

EXTRACTS FROM CORRESPONDENTS' LETTERS.

"Our View of It."

I THINK your subscribers will generally thank you for the opinions expressed in your article under the above heading. No doubt Professor BEAL'S experiment was carefully conducted, and the results correctly reported, though I should not be surprised to see interested parties try to show otherwise. The experiment is valuable, as it shows the reliableness of seeds as they are sold to dealers and planters in the open market. There is a demand for cheap seeds, but every good gardener knows such seeds are dear at any price. This experiment will cause others to be made, and may eventually cause better seeds to be put upon the market; though, as I notice, most people sow all garden seeds too thick, even when of poor quality, public confidence would have to be regained before it would be of much benefit to the average planter. E. L. M.

Tomatoes.

ON my flower-stand, among the Fuchsias, Roses and Geraniums, are two small green boxes of tomato plants, the seeds sown not many days ago. My object in keeping them there is because I am sure to give them due attention when caring for the other plants. There is nothing objectionable in having Tomatoes among the flowers until large enough for the first transplanting. Then, I will put them in larger boxes or tin cans, and keep them in the kitchen until it is time to set them out in the ground. Ladies are apt to be so given to floriculture that they often neglect to sow vegetable seeds of any kind in the house or hot-bed. A little attention in this line will pay well for the trouble. I always sow Lettuce, Cress, Radishes and Peppers in the hot-bed, but am more successful with Tomatoes, treated as above. The "Early Smooth Red" is an excellent variety. M. G. R.

SEED EXCHANGE.

MANY thanks for the seeds the RURAL so kindly sent. I would like to exchange an Amaryllis or Jacobean Lily for a variegated Caladium, and a plain green Caladium or three varieties of Cannas for a Wigandia, or double (?) Japan Lily. Last summer I had Cannas that were eight feet four inches high, and Caladium leaves that were 28 by 41 inches, standing 6 feet 6 inches high.

Those wishing to exchange, please direct postal card to J. B. VERDEN.

Cochranton, Marten Co., Ohio.

THE RURAL being a "medium for the exchange of seeds," I have the following I would like to exchange: Dahlia; Pansy (best); Bryonopsis laciniata; Aster, several sorts; Dianthus diadematus laciniatus, etc.; Petunia, several sorts; Marigold, new sort; Verbenas, several sorts; Canna, many sorts; Celosia, several sorts; Amaranthus tricolor; Balsams, several sorts, including Gregory's "Yellow;" Gaillardia; Antirrhinum, several sorts; Chrysanthemum, several sorts; Coreopsis; Nasturtiums; Phlox Drummondii, all sorts: Columbine, different sorts; etc., etc. Of vegetables, I have six or eight sorts of Squashes; "100-day Tomato;" Sweet Corn, several sorts; Field Corn, six or eight sorts, including Compton's Centennial Prize Corn; Prof. Murdock's celebrated Yellow, 76-day Corn, good size, prolific and weighs more than it measures. It would be trespassing on the already crowded space of the RURAL to extend the list, since I have most "things" found in an amateur's garden.

I will exchange any of the above for Double Portulaca, Ten-week Stock, Scarlet Sage, Centaurea Americana, Digitalis, Cyclamen, Datura Wrightii. Of vegetables, I wish Mammoth Chili, Yokahama, Valparaiso, Nantucket and Butman's Squashes. With regard to the other seeds I have and those I want, if I rightly understand the RURAL'S scheme, we can arrange after we have once been brought together by correspondence. My Pansy seed, in fact all, are of the best strains, and procured at the highest prices to insure the best seeds. A. C. WILLIAMS.

Hugo, Ill.

I shall have a large quantity of surplus Dahlia roots next spring, perhaps ten to twenty bushels, representing 300 to 400 colors, all very fine. I would like to exchange these for any of the bulb plants, any of the new colored Peonies, any of the Lilies except Tiger, (double Tiger is a poor thing), any choice hot-house plants, or any hardy ornamental shrubs. I should also like a three-cornered Cactus, the sides full; or seeds of any rare plants, perennials in particular. Write what you have to spare and I will reply.

A. G. BISBEE.

Willoughby, Lake Co., Ohio.

I HAVE 150 or 200 varieties of plants, including hardy shrubs and vines, green-house and bedding plants, bulbous and tuberous roots, which I would be glad to exchange for others with any one who will exchange lists with me.

MRS. VIRGINIA S. HALLER.

Marion, Smyth Co., Va.

SEEING the RURAL'S offer with regard to the exchange of seeds and plants, I would like to profit by it. I have a good many different kinds, and would be glad to exchange some of them for others. The following are the names of some of the seeds that I have to spare: Candytuft; Pinks; Morning Glory; Sweet Peas, mixed; Double Hollyhocks, mixed; Mourning Brides; Clarkia; Eternal Flower; Marigold.

Cedarville, N. Y. E. P. HUNTLEY.

I AM a recent subscriber to your paper, am much pleased therewith, and sorry I was not sooner acquainted with its merits. In No. 7, Feb. 16th, you invite those having plants or seeds to exchange to send in lists. Herewith I send mine. I am in a position to supply almost any variety of vegetable seeds and a great many sorts of flower seeds. Would like some information on growing Gladiolus. [As soon as we can find space.—EDS.]

Tomato Plants or Seeds: Trophy, Canada Victor, Conqueror, Red Smooth and Strawberry. Vegetable Seeds of every kind, many varieties. Flower Seeds: Delphinium, Drummond's Phlox, Everlastings, three sorts, Eschscholtzia, Crimson Mignonette, Double Petunia and Portulaca. Ornamental Grasses, four varieties, Verbenas &c. For Flower Seeds or Bulbs: Address for one month, ROBERT R. MCGILL.

Bay Ridge, L. I., N. Y.

[SOME of the persons offering Exchanges are known to us—some are not. We cannot vouch for their good faith. Readers must judge for themselves.—EDS.]

THE AUBURN HORSE.

CATALOGUES, &c., RECEIVED.

WE thank Mr. Henry M. Seely, Secretary, for the Fourth Report of the Vermont Board of Agriculture for the year 1877.

I. C. WOOD & BROTHER, Fishkill, Dutchess Co., N. Y.

No. 3. Wholesale price-list—Fruits, deciduous and evergreen trees and shrubs.

No. 5. Wholesale price-list of plants.

No. 7. Price-list of plants by mail.

Illustrated catalogue and price-list of the Whitney crates and baskets.

ANNUAL REPORT of the Connecticut Agricultural Experiment Station for 1877.

ADVANCE sheets from a work on Sheep Husbandry by J. B. Killebrew.

ANNUAL REPORT of the Entomological Society of Ontario for the year 1877, including reports on some of the noxious, beneficial and other insects of the Province of Ontario; prepared for the Commissioner of Agriculture on behalf of the Society, by William Saunders, Rev. C. J. S. Bethune, B. Gott and Joseph Williams.

TWENTY-SECOND ANNUAL CATALOGUE of St. Mary's Academy, Notre Dame, Ind., for the academic year 1876-7.

E. B. UNDERHILL, Poughkeepsie, N. Y. Circular and price-list of strawberries, raspberries and currants.

THE following is a list of the officers of the American Cotswold Association, as reorganized:

President—T. L. Miller, Beecher, Ills.

Vice-Presidents—John C. Snell, Edmonton, Ont.; Chas. P. Mattocks, Portland, Me.; Robert C. Estill, Lexington, Ky.

Secretary and Treasurer—Chas. P. Willard, Chicago, Ills.

Board of Directors—Samuel E. Prather, Sherman, Ills.; Chas. A. Degraff, Janesville, Minn.; Chas. F. Mills, Springfield, Ills.; T. L. Miller, Beecher, Ills.; Chas. P. Willard, Chicago, Ills.

The Cotswold Record is progressing favorably, the work having the endorsement and support of the best breeders of the country.

SECRETARY'S Third Annual Report to the American Berkshire Association, together with suggestions, instructions and rules covering applications for entry in the Record.

A GUIDE to Southeastern Nebraska, with a new map of the "wonderful Nemaha Valley." Published by the Southeastern Neb. Immigrant Union.

STORRS, HARRISON & Co., Painesville, Ohio. A trustworthy establishment, and a neat, comprehensive catalogue of 80 pages.

New and rare plants for 1878, including greenhouse and bedding plants. We have never seen finer nursery stock anywhere than in the extensive grounds of Storrs, Harrisen & Co.

HOVEY & Co., 16 South Market St., Boston, Mass. Illustrated Guide and Seed Catalogue for 1878.—84 pages. It is a matter of surprise how this firm can afford to send a catalogue of this size free to applicants. The firm is too well known to need any special commendation from us.

ALFRED BRIDGEMAN, 876 Broadway, N. Y.

There is no space lost in this excellent catalogue, which gives the botanical and familiar name, hight of plant, duration and hardiness, in an abbreviated form, leaving a solid list of all that is desirable among vegetable and flower seeds. A long list of rare novelties, among both vegetables and flowers, is given, with descriptions. Among these we notice the Shell Flower (Molucella lævis), which will delight all lovers of the odd in floriculture—and Glaucium luteum, a plant with creamy-white foliage, which the RURAL has lately distributed among many of its subscribers.

We are pleased to commend this establishment and this catalogue (which is sent free to applicants) to our readers and friends.

The Horseman.

THE AUBURN HORSE.

THE splendid specimen of the equine race known by the name of the Auburn Horse, was foaled in 1858 and bred by PHILIP SMELZER of Lodi, New York. His dam was out of a Vermont Hamblotonian mare by a Bellfounder horse, and his sire by Champion, greatgrandson of imported Messenger. He was over sixteen hands high and in color a golden chestnut. When two years old, he was sold for a price boasted to have been $400. In May 1865 he was bought by Mr. PARSONS of Auburn for $550 and henceforth was known by the name of the town wherein his purchaser dwelt. It required little training in his case to develop great speed and to give promise of marvelous powers. His fame rapidly spread abroad and later in 1865 he was purchased for $13,000 by Mr. ROBERT BONNER, and became the stable companion of such famous trotters as Lantern, Lady Palmer and her mate, Flatbush Maid, the beautiful gray mare, Peerless, and other flyers owned by the same liberal lover of horse-flesh. In the hands of his new owner he had the advantage of the best care and training, and soon satisfied such excellent judges of equine fleetness as his owner, HIRAM WOODRUFF and others, that he was the fastest trotter on this footstool, and could even beat Dexter's best time. The uniform policy of his new owner, however, prevented his appearance on the trotting track, and his best public performance was shortly after his arrival in this city when, driven by Mr. BONNER to a road-wagon which with the driver weighed 325 pounds, he trotted a mile in 2 minutes 39 seconds. HIRAM WOODRUFF, one of the very best judges of trotting stock we have ever had in this country, in lamenting the early death of this fine gelding, declared that he was the best horse he had ever held reins over, not barring Lady Thorn or his favorite, Dexter. In appearance he was a perfect model of equine power, with great muscles, faultless bone, iron sinews, hard flesh just "placed where it did the most good," clean limbs, slender neck, bony head, fine eyes, and altogether a very thoroughbred form.

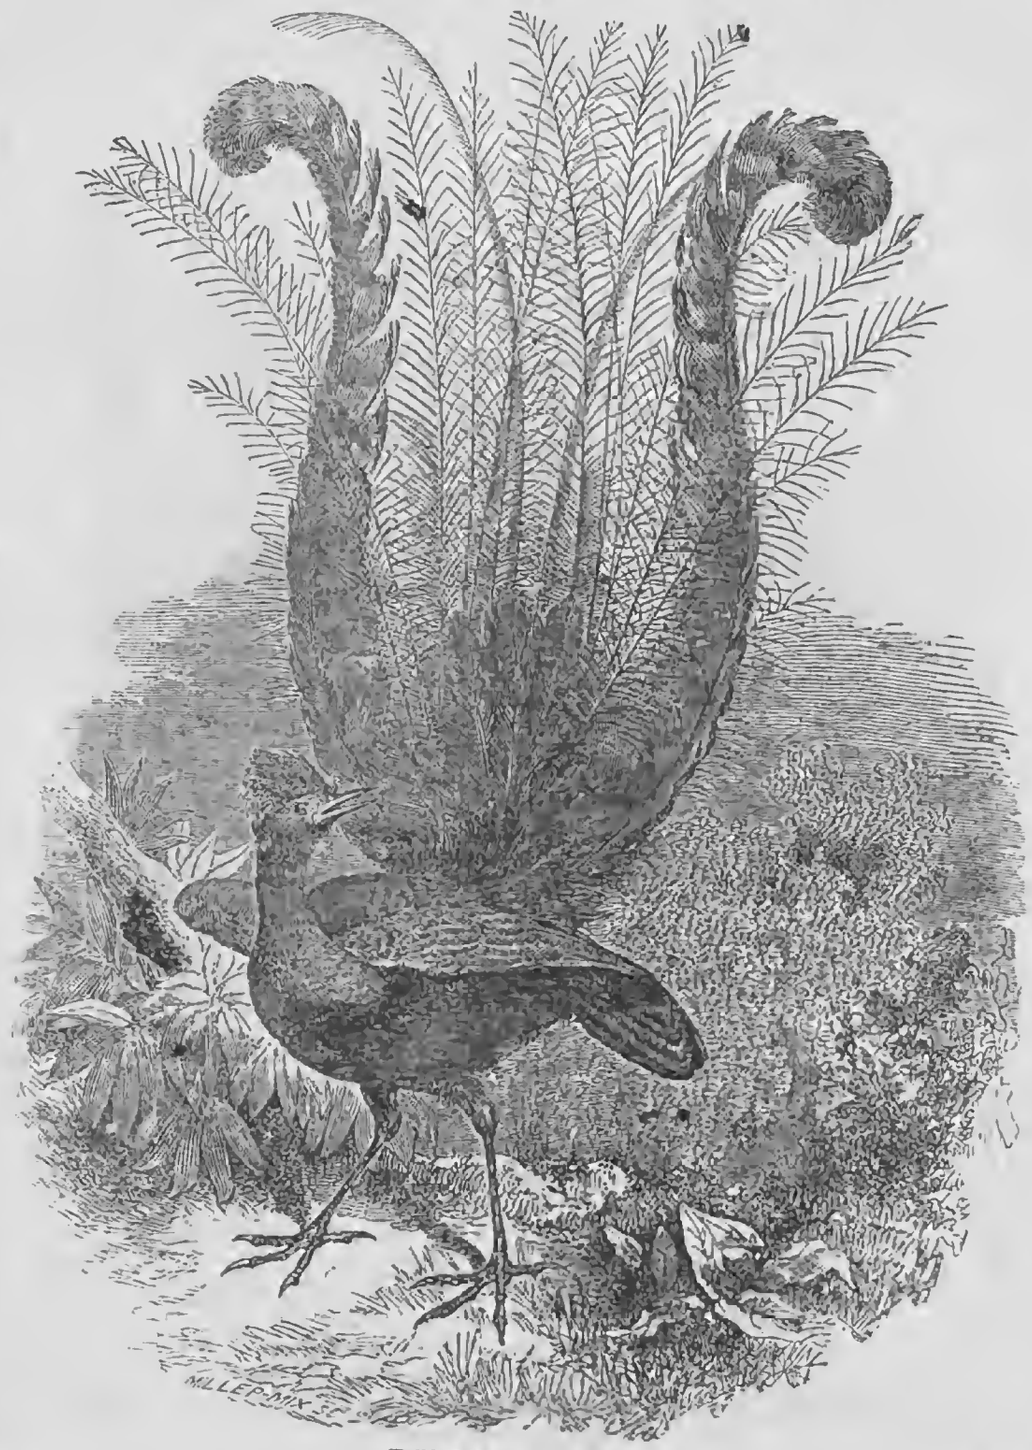
The Naturalist.

THE LYRE BIRD.

OF lyre birds there are only two species described by naturalists, both of which are natives of Australia, and together constitute the genus *Menura*. Of these by far the most common is the wood-pheasant, *M. superba*, which, from the form of its legs, has been placed by some among the gallinaceous tribes, while others class it with the hornbills, and yet others with the thrushes or the wren family. Its length is about forty-three inches, of which the tail constitutes twenty-five inches; the bill is a trifle over an inch long, resembling that of a peacock,

and in a groove, near the middle of its length, are the nostrils, which are long and narrow. The wings are short, concave and rounded, the quill feathers short and feeble, the general plumage full, deep and soft, of a brownish black above and a grayish brown below; the head is slightly crested and the throat of a reddish hue; the size is about that of the pheasant. The birds are very shy, running rapidly among the brush-wood, scratching for slugs, beetles and insects, generally among fallen leaves, and seldom taking to wing. They live in pairs in rocky places overgrown with bushes; their motions are graceful, the males strutting and displaying their tails with all the pride of peacocks, from which they greatly differ in having a pleasing voice of varied intonation.

The chief characteristic of the lyre bird, however, is its ornamental tail, from the singular shape of which it derives its name. This consists of sixteen feathers of three distinct kinds. The external two are broadly but loosely webbed on the inside, curve outward then inward, and again turn boldly outward and downward, both together forming an outline resembling that of an ancient lyre of which the fourteen intermediate feathers are the strings. Except the two center ones, these consist of slender shafts, two feet long, truly webbed with delicate, alternate filaments, springing out at increasing intervals towards the end. The two middle feathers are longer than the rest, pointed at the end and barbed only on the outer side. The color of this graceful ornament is an amber brown, except the two outer feathers, which are black, with a narrow white border, pearly underneath, and with bright reddish spots on the inner web. This gorgeous tail is confined to the males, that of the female being long and graduated, the feathers perfectly webbed on both sides of the shaft, and the texture soft and flowing.



LYRE BIRD.

Farm Topics.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D. CURTIS.

We have cut all of the beech wood on several acres, which we found to be very much decayed in all of the large trees at the heart, while the tops of almost all were more or less dead, and getting rotten. We think we have saved money by clearing off this wood; as in a few years more the large trees would not have made but a very little of marketable wood, and the decay in all of them would have kept pace with the growth and we are not sure but that it would have exceeded it. Where then is the profit of letting such timber stand? We shall not clear off all of the wood but have left the Sugar-maples, the Basswoods, Ash, Ironwood, and the thrifty Hemlocks. The most of the timber growing on this ground was Beech, and now since it is all cut away the timber is thin and scattering. As the land is rather rough and a sidehill, we want to keep it in woods, and therefore we shall plant on this ground the nuts of the Black-walnut, and let them grow into a grove. If we put the nuts in the ground, in the fall, the squirrels would doubtless dig them all up during the winter, so we shall bury them in a pit near the house and plant them in the spots where they are wanted to grow in the spring. There are now several bushels of black-walnuts in the wagon-house chamber, and we wonder if they will grow. If they will, then the grove may be started next spring. Most nuts will not germinate after they get dry. These may be an exception. Anyway, we will bury a couple of bushels right-away under some coarser mulch, and try to keep them in a condition to grow if possible. If they fail, another fall ample preparations may be made. These black-walnuts have a somewhat rank and oily taste, and most people do not like them, especially if they have plenty of hickory or chesnuts; but where the latter do not abound, folks do eat the coarser black-walnuts and seem to think they are good. In West Virginia they grow in great abundance, and are gathered and sent to the cities where they sell for from 75 cents to $1 a bushel. This would make the nuts quite a source of profit if the husks came off readily, but it is considerable work to fit them for market. The oil in them must have a value, and if expressed would no doubt find a sale as a lubricator of fine machinery.

We observe that Mr. DIMON says the Ayrshire is the best family cow. Our baby has done splendidly on the milk of a pure-bred Ayrshire cow, after getting sick on the milk of the Jersey. There is more butter in the milk of the Jersey, it is richer, and they are better cows for a butter dairy. Once the calf of a Jersey cow while sucking its dam, became very sick and weak. A change to an Ayrshire cow soon cured it. It could not digest Jersey milk. Some grown-up people cannot digest butter, and have to do without; and, when we remember that the milk of many Jersey cows is one-fifth butter, no wonder that it disagrees with these young things.

Another year we must save a lot of cabbage to feed the hens in winter. This is probably the best form in which green feed can be stored up for them, and as we are satisfied they require it, we shall lay in a stock of cabbage. The wonder is we have never thought of it before. The bastard heads will do for the poultry, and so will the stems if they are cut fine. Where the snow does not cover up the grass they can find green bits for themselves, but in our cold and snowy climate this want ought to be provided for.

One of the new milch cows began to run down on her feed of all the hay she could eat and a half bushel of turnips. She could not eat hay enough to keep her in condition, as too much of her subsistence went into milk, and so a peck a day of buckwheat bran has been added to her daily rations. She is improving on this, and the other cow is fed the same, so she will not also run down. Our long winters compel us to economize in feed, and sometimes, no doubt, to our detriment.

The breeding sows have been separated and each one has a pen by herself, as the pigs are due within two weeks. A feed of corn once a day will now be added to the mangels. It would not do to feed corn alone, for this would produce constipation, and then we might expect the mothers to be restless and perhaps crazy, as they sometimes are when the young are born, and either lie on them or eat them up, according to the degree of their malady. This is the cause of the "ugliness" and "ferocity" of sows when they are so. And the remedy is prevention, by giving them a variety of food, and such as shall put their stomachs and bowels in the best possible condition. Do not give them all corn or all roots but some of both, with a half bushel of ashes to root over to get the charcoal, and plenty of good swill.

We saw, awhile ago at a friend's house, the best form of a ventilator. A board is fitted between the jambs, eight or ten inches high at the bottom of the window. The window being lifted at the bottom allows the fresh air to come in, which strikes against the board and escapes over the top of the board into the room without any current or draught. The quantity of air desired can be regulated by the hight of the board and the distance between it and the window, which may be close or otherwise.

If a chicken freezes its comb or wattles, cut them off at once and they will heal over in a few days. If not treated in this way, it will take weeks for the dead parts to dry up, drop off and heal up. It does not seem to injure a fowl to have these parts cut away, for if it did then game cocks would show it, as they are denuded of every bit of their combs and wattles by sportsmen, (?) apparently without any detriment, as they do as well afterwards, and, they say, fight better, when deprived of these sensitive organs, having more courage and being less liable to get wounded.

AN EXPERIMENT WITH FERTILIZERS.

BELIEVING that it is for the interest of RURAL readers to compare notes with each other on a subject in which we are all so much interested as in the effects of different fertilizers, I give you the result of some experiments I made during the past season: I broke up, in the spring of 1877, about four acres of poor land, such as, without any fertilizer or stimulant of any kind, would not produce a good crop, and sowed it to buckwheat, using on a portion of it, about two acres, well-rotted cow manure. On another portion of about one acre, I applied the scrapings of the chip-yard, which were also well rotted, and which my neighbors told me I would receive no benefit from. On the remainder of the field, except a few rods on which I did not use any fertilizer, I applied 80 pounds of superphosphate to the acre.

Now, for the results: I harvested from the whole field 85⅓ bushels of buckwheat. The growth of straw, except where no fertilizer was used, was very uniform. On that portion where I had used the superphosphate it seemed to be filled somewhat better than on the remainder of the piece, while that portion on which the chip manure was applied was quite as good as where I used the stable manure; thus proving satisfactorily to me, that there is some virtue in the scrapings of the wood yard. The part on which no manure was used, was very light, and had the whole field been as poor, it would hardly have paid for harvesting. All this goes to prove to me that whatever we invest for fertilizers, if adapted to the soil and crop on which they are used, comes back to us in the first crop, besides adding to the value of our land.

E. J. BROWNELL.

WORTH KNOWING.

IN this section of country it is the custom of our farmers to fatten and kill one or more beeves during the winter. In most cases a quarter or a half is used in the family, and the balance sold. Usually the prices range very low, and only a small amount of ready cash is realized. This winter, having some difficulty to sell half a beef at a paying price, I concluded to convert the round of the hind quarters into smoked beef. I looked over my RURAL papers, but could find no statement of profit and loss. I give the result of my experiment, therefore, to your readers, and would add: let the farmer note that from this little item he can more than save the subscription price of the RURAL:

DR.

By 115 lbs. beef, at 7 cts.	$8 05

CR.

To 70½ lbs., at 16 cts.	$11 28
5 lbs. trimmings, clear meat, at 8 cts.	40
34½ lbs. soup bones, at 2 cts.	69
5 lbs. shrinkage	
	$12 37
Value of beef	8 05
Profit	$4 32

Gross weight of cow, 515 lbs.; rather fine boned. The grocer with whom I trade offers me 16 cts. cash, or 17 cts. per pound in trade.

Walden, N. Y. H.

Farm Economy.

COST OF BARN YARD MANURE.

W. J. FOWLER.

IF any farmer reckon the amount of produce in his barns and stocks in the fall, the value of his stock then, and its value in the spring when feeding ceases, he will have the data for deciding how much his manure pile has cost him. Whoever does this will be surprised at the expensiveness of home-made fertilizers. In a large majority of instances barn-yard manure as it is hauled out in the spring, costs fully one dollar per load, or fully as much as is charged for it from city stables. If this manure is kept a year and partially decomposed, its cost per load will be twice or thrice as much. Farmers are seriously asking themselves whether they can afford this expense. So near the city of Rochester as this, there is always a market for even the coarsest produce, so that there is no necessity, except for manuring the soil, to feed it on the farm. But the salable value of almost every thing is greater than its manurial value. A load of straw that will sell for $6 to $8 will hardly make $1 worth of manure. The difference is even greater with most other articles of farm produce. Whenever it can be done, the advantage is almost always in selling whatever will sell and maintaining the fertility of the farm by liberal purchases of manure. The failures in farming always come from buying too little fertilizers and never from selling too much produce.

On every farm there will always be some manure from work-horses, from fowls, and from the cows needed to supply butter, or at least milk for the family. This should be saved as carefully as if it were the main dependence. But the bulk of fertilizers must be obtained in some cheaper way. We cannot afford to keep large stocks of cattle, sheep, and horses mainly for the manure they will make unless this is the only resource for fertilizing the soil. We had better do almost any thing rather than let the farm deteriorate. In my opinion commercial manures are the best substitute for those which the farmer himself can make. Care must be taken to get those which are what they profess to be, and this done, they may be used in much larger quantities than even the most liberal farmers have ever attempted. It may seem foolish to many to apply a few hundred pounds of fertilizer with the expectation of realizing as much benefit as from several tons of barn-yard manure. But it is not the bulk which tells. Analysis proves that the phosphates and nitrates in a large load of coarse manure may not be greater in amount than those elements in a dressing of superphosphate or guano. If the manure is mainly made from straw, its fertilizing properties will be very slight in comparison with any reliable concentrated manure. The bulk of most stable manure, especially if unrotted, consists of carbonaceous subtances in which few soils are deficient. Carbon needed for plant-food is supplied in abundance by the carbonic acid of the atmosphere. It is pretty well established now that plants derive through their leaves from the air all the material for starch and other carbonaceous matter which they contain. What the farmer needs to do is only to supply phosphates, lime, potash and nitrogen and to keep the soil in such mechanical condition as to make these elements available. A large crop takes from the soil only a few pounds of these precious elements. It is entirely reasonable to believe that the restoration of an equal quantity will make good the loss. This is not mere theory. Messrs. LAWES & GILBERT of Rothamstead, England, have proved by carefully conducted experiments, that fertility may be kept up for a long series of years with continuous cropping solely by the application of concentrated manures. This subject is one of great and increasing interest to American farmers,

who must more and more depend on the chemist's laboratory rather than on their barn-yards for fertilizers.

Monroe Co., N. Y.

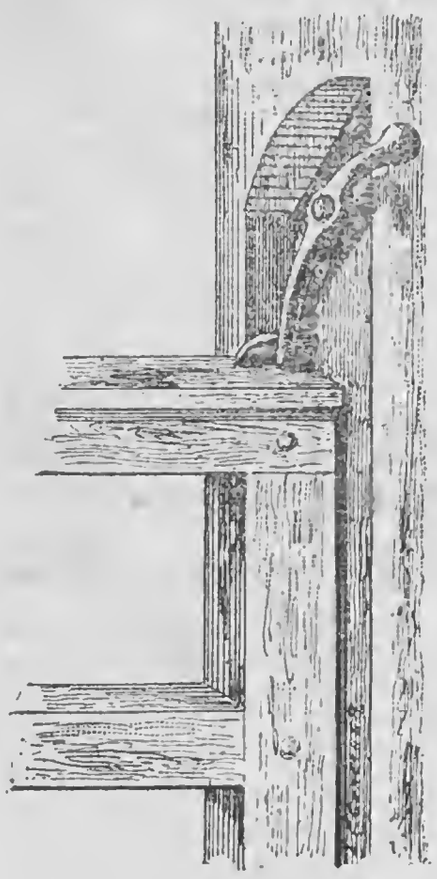
MANURES.

It becomes a pressing duty on the farm, at this season, to devote serious attention to the subject of fertilizers. Do not go at the subject blindly. Study, as well as you may, the requirements of your land, and aim to supply its deficiencies through artificial channels. If you are not at all sure as to what your land lacks, which, alas! is too often the case, compel prejudice and custom to yield a point, and do a little intelligent experimenting. Try fertilizers of various constituent parts, but be sure you know of what they are composed, and are prepared to apply the experiences gained to subsequent operations.

You will, no doubt, have to use some bone superphosphate. Be careful to avoid materials not strictly pure. If you have occasion to use ammoniated bone superphosphate, yan may buy the article made at Buffalo, N. Y., by L. L. Crocker, with the assurance that you are getting a "straight" fertilizer, whose effect may be counted on with certainty, if your land requires this manure.

GATE LATCH.

Sink a notch in the gate-post two inches deep shaped as in the figure. In this fasten to the post by a bolt the catch as shown in the cut. In the end of the gate, opposite this catch, place an iron pin or bolt ⅝ or more in diameter. Push the gate shut and the pin shoves the lower end



of the catch back and up. This drops and holds the gate closed. To open the gate place the thumb on the knob of catch. This is cheap, simple, effective, and not likely to be opened by trickey cattle. This was seen on several farms in Climax, Michigan.

FARM HELP.

Knowing the Rural is just enough to afford an opportunity for a fair prosentation of all sides of a question, I take the privilege of making a few remarks on an article that lately appeared in its columns under the title "How to make farming profitable." In the first place, the writer, Mr. T. B. Miner, is certainly old enough to know that, as a general rule, farmers are quite hard enough on their help, without any of his prompting. According to his views, hired hands should have no more privilege or consideration than an ox or a horse. It would be little wonder in that case, if they took no more interest in their work and required as constant watching! You think, Mr. Miner, because you are rich and I am poor, that it is your place to be a hard taskmaster and mine, a diligent toiler who must never staighten his bent back for a few moments' rest, however toilsome the labor or hot the day. As for a fair day's work, I am glad to get it and never shirk it, but to work for a taskmaster of your type — never! I know of men that started as poor as poor could be, and who to-day are far richer than you (?) and yet they have always had the good-will of all about them, which you couldn't have had, and have always been called "easy men to work for," a title of honor of which you acknowledge yourself undeserving. The idea of telling a man to "shut up," when he wanted to say a few words, just because it might take a moment that did not belong to him! But you, Mr. Miner, and those like you, do not hesitate to ask your hired man to work after dark, every few nights, to finish a field of hay, or do something you are in a hurry for. But I tell you, farmers, when one hand refuses to wash the other, both are soon in a sorry pickle, and if the employer keeps his help's nose constantly to the grindstone during every moment the pittance of pay entitles him to do so, he should not, and must not, expect anything more from him. Yet, on every farm, whenever a storm is coming up, it's hurry! hurry! until the rain comes down. And then, instead of saying "Boys rest a few minutes before going to work again," Mr. Miner would have some posts ready under the barn, on which he would insist that his hands, panting from their late exertions in his behalf, should at once set to work! But even in hired help there still remains a good deal of human nature, and sometimes not a little intelligence, and they are sure soon to learn this trick, and when called upon to hurry, will do so very slowly.

Indeed, under such a master as Mr. T. B. Miner, pray what encouragement is there to exertion? He boasts of having been "a hard man to work for," but says he was "good pay." With regard to the first part of this there will be few to misunderstand him; but with regard to "good pay," what does the phrase generally mean in the mouth of a "hard man?" In my experience, and I doubt not in that of most others, it simply means that he hired men at the lowest rate at which he could get the class of help he wanted, wrung all the work he possibly could out of them at all hours, and didn't cheat them out of their sweat-stained wages.

If a man gets the good-will of his help, and they are of the right sort, such as Mr. Miner says he always hired, he will get much more and better work out of them than if their only inducement to labor is dread of their driver's tongue-lash or fear of being shown the road. Neither is there then any necessity of his being constantly with them, for if sent to the field alone each will do a fair day's work without even a thought of shirking. On the other hand, with regard to the help employed by men like Mr. Miner, it is just as Mr. Miner says: You have to be with them every minute. This, farmers, I know to be a fact, and not a few among you, who in your day were hired hands also, know it likewise. A Farm Hand.

HIRED HELP.

In Rural New-Yorker for March 2nd, Mr. T. B. Miner proceeds to "lay down a few rules for farming," and among some things that are really commendable and sensible, gives his views in regard to the treatment and management of "hired help." Most of these views I think are wrong in principle, and would be disastrous in practice. First, I find in rule second, he says: "A man and boy will often do as much work as two men, especially if the latter are left to work by themselves, as they frequently spend half of their time in talking;" and he implies that a man will not talk to a boy. Now, is this a fact? I think not; for if the boy be old enough to accomplish even half the work of an ordinary man, he is as apt to talk to the man, and *more* liable to stop to listen than the man; and, in several years spent on a farm, I have observed that men will talk to an intelligent boy as readily as to a man, if there are no men in the field. Indeed, so far as my experience goes, it does not pay to employ boy help on a farm where all the help is hired.

Again, he says: "When I hire a man, I tell him plainly that he must not 'fool' away his time (my time) in talking to other men while at work, unless he wants his 'walking papers.'" One would very naturally infer that Mr. Miner follows the plan adopted in some of the penal institutions of the country, namely: the silent system. But even in our prisons this system has been acknowledged by some of the best men who have had charge of such institutions, to be a stupendous failure; and in this State and some others, the system has been abandoned for the reason that the men are more easily controlled, and will accomplish more work when allowed to talk. Furthermore, here in the West, if a man were to use the language quoted above, when hiring men, he would find but very few who would work for him at all. Now, permit me to express it as my opinion, if a man is capable and does his work well, but very few men of sense will object to his talking; and further that a man who cannot work and talk, or listen at the same time, and do his work well, is not worth his board, whether he talks or not.

NORWAY SPRUCE—SHELTER BELT.

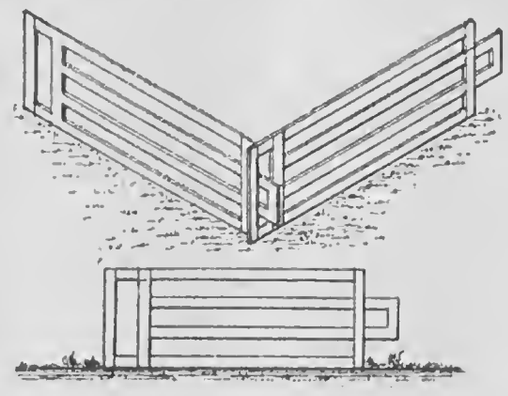
Farther on he says: "I say to my men in plain English: 'Shut up and attend to your work, or take your money and go. I hire men to *work*—not to spend their time in talking.'" Now, if Mr. M. uses such language to his men—which I doubt, notwithstanding his assertion—I will venture to say that he employs only stupid, ignorant men—men but little, if any better than a brute or a machine, and who are good for nothing without a *driver*; for smart, intelligent men who know how work should be done, will not brook such language from their employer.

In regard to Mr. Miner's assertion that it shows a lack of administrative ability in a farmer to be called "a good man to work for." I have this to say: I can refer him to several of our most successful farmers here, as such men; and if their success is to be taken as proof, it pays to treat even *hired help* as men, and not as mere machines to be *driven*. And his further assertion that "nine farm-hands out of ten will not do half-a-days work on an average if you are so easy with them that they call you "a nice man to work for," is a libel on the intelligence and fidelity of working-men in general, and does no honor to the writer. "A Hired Man."

Waupun, Wis., March 4, 1878.

FENCE FOR OVERFLOWED LAND.

I. A. Youngs wants a fence for overflowed land. The sketch below shows a single panel, and also two panels set up. We use here boards 1 by 6, 12 feet long. Let the projecting ends stand out 12 inches. This fence needs no posts,



and two men with a team to haul the panels, can set up 400 rods in a day, if the hauling distance is not too far. It is best to make the panels near the line of fence. Put the boards together with eight-penny wrought nails. It withstands our winds well. Can be taken down rapidly. S. Rufus Mason.

Purple Cane, Dodge Co., Nebraska.

CONVERTING MAPLE SIRUP INTO SUGAR

As I partly promised in my article on "Manufecture of Maple Syrup," to give some hints on converting it into sugar, I will now try and do so briefly.

As I said in my former article, "No foreign substance should be permitted to find its way into the sap from the time it leaves the tree till ready for use." I would here still further emphasize the assertion; though many I know will differ with me, and be ready to maintain that without the use of milk, eggs, or something else to clarify the sirup, you cannot make a prime article; still I think if even those persons, would try the following mode, they would be convinced that the clarifying process at least was no advantage, even if not a positive injury to the quality of the article. Set the sirup in a tub, with a faucet about two inches from the bottom, and let it stand long enough to settle thoroughly; then draw off through the faucet, thus leaving the sediment at the bottom of the tub, and you will find there will be nothing in the sugar that will injure it. Indeed, I am disposed to believe it to be freer from impurities than when clarified by the ordinary method. Boil carefully in a sheet-iron pan, about eight or ten inches in depth and as large in area as convenient for the size of your stove, until hard enough to cake. When it is fit for this, we ascertain by dropping some on a new tin dish and, if when cold it cleaves readily from the dish, it is hard enough. Stir occasionally until cool enough to take out for caking in the dishes which should be wet with cold water to prevent it from sticking to them. The most convenient form of cakes I find to be about the size of an ordinary brick, and dishes for these can be made by any tinsmith. D. J. B.

Arboricultural.

SHELTER BELTS.

In view of the manifold advantages of trees for timber, shelter and ornament, their conceded influence in securing a beneficial water supply, and their constant destruction to meet the demands of home industry and foreign requirements, coupled with an innate disinclination in the minds of many to make an immediate outlay, however trifling, either of money or time, for the purpose of insuring a comparatively remote benefit, however important, it would be a national blessing if a law were passed in every State compelling all landowners to set out a certain number of trees each year until the number, on every farm, should bear a specified proportion to its extent.

Beneficial as such an enactment, duly enforced, would be at the East, its advantages would, ere long, be far more appreciable on the bleak-looking prairies of the West. Experience has amply shown that lines and belts of trees, by checking the violent sweep of prevailing winds, materially increase the crops they shelter; afford a healthful and economical protection to stock of all kinds; and salubriously temper the local climate round every homestead whose beauty and value their presence enhances. While for timber, it would not take long to establish a walnut grove from walnuts, and oak, hickory, maple and other suitable deciduous trees could be procured and planted at a trifling expense: for shelter, a belt of evergreens would, on many accounts, be the most desirable. To say nothing of the relief their leafy presence affords to the bleakness of winter scenery, the protection they offer to man and beast, would be invaluable at that season when on the exposed prairies, fierce gales laden with icy death, render protection most needed. Of evergreen trees adapted to this purpose not the least desirable is the Norway Spruce.

The valid nature of the protection afforded by a line of these trees, is excellently exemplified by the accompanying engraving taken, a few weeks ago, from a photograph of one of the Norway Spruce shelter belts in the grounds of Messrs. Robert Douglas & Sons, of Waukegan, Ills. The belt was planted eight years ago, and in the last four years has made growth of nearly nine feet. This surely proves there is no reason why prairie farmers need have their dwellings and stock exposed to the unchecked violence of wintery gales, if they wish to shelter them.

Miscellaneous.

KELLOGG'S SALE OF TROTTING STOCK.

A NEW DEPARTURE.

Mr. Peter C. Kellogg, well known among horsemen and readers of Agricultural papers by his *nom de plume* "Hark Comstock," has issued a catalogue of horses offered at a "special combination sale" to take place on the 27th and 28th, in this city, at the building long known as the "Rink." Mr. Kellogg has laid himself out to secure a selection of excellent trotting horses, which are chiefly breeding animals. He has pledged every owner upon his honor not to have his stock

bid upon or run up by interested parties; and he has entered into stringent contracts with them to the same effect, so that it may be fairly assumed that every bid made will be in good faith. Nearly all the horses are registered in WALLACE'S Register; all are to be collected in the vicinity of the American Institute Building, (the Rink,) ten days before the sale, and all moneys will be retained by the auctioneers, (VAN TASSELL & KEARNEY) for three days, to enable buyers to verify warrantees. These are some of the commendable provisions to secure the confidence of buyers, but the fact that Mr. KELLOGG has devised and is carrying out the scheme is the strongest guarantee of perfect fairness and satisfaction to both buyer and seller. There are 95 horses catalogued. Of these 15 are stallions, and 21 brood mares, and among these and the roadsters are not a few which are quite famous. The breeders' names and addresses are given in full, together with extended statements in regard to pedigrees and performances. The catalogue forms a considerable pamphlet and an appendix of 18 pages contains one of the most valuable essays on the breeding of trotting horses which has ever appeared — a condensation of "Hark Comstock's articles—entitled "Echoes for Breeders' Ears." An advertisement of the sale appears in its proper place.

RURAL SPECIAL REPORTS.

(See pages 171, 172, for other Reports.)

Floyd Co., Iowa, March 9, '78.

WE have had the most remarkable winter for this latitude, on record. Have had no snow since last November, no storms and very little cold weather. February was like balmy May, and March is duplicating it thus far. Our farmers have been plowing and seeding for the past two weeks. The ground is in splendid condition for tillage. Several of our citizens have visited Texas and other Southern States this winter, but all have returned better satisfied than ever with our beautiful Iowa. One remarked that Floyd Co. is worth more than the whole State of Florida. W. L. MCEWEN.

P. S.—We are disappointed in not receiving the promised seeds.

[Positively the seeds were mailed to you if you applied.—ED.]

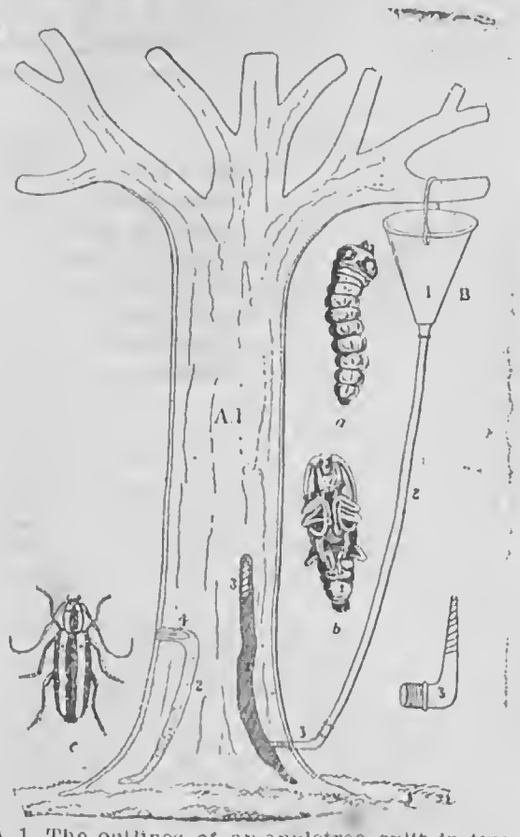
WHEELER, N. Y., Feb. 28.

PLEASANT weather still continues. Our sleighing from the 1st of the month to the 20th called out the lumbermen, and a large stock of logs are being hauled to the mills daily. The past three days have been fine sap days. Farmers are hiring hands for the coming season at prices ranging from $12 to $18 a month, with board and washing. I have noticed that the most of the "Rural Special Reports" are from New York State, only occasionally one from another State. As good a paper as the RURAL must have a large circulation in other States than this. It seems as though the correspondents' column might be made more interesting, if even a few only of the many readers would send in a report monthly from their immediate vicinity. Items from other States are interesting sometimes. S. S.

Entomological.

TO KILL THE LARVÆ OF THE APPLE TREE BORER.

THE eggs of the apple tree borer, Saperda bivittata, are deposited at the base of the main stem, and the hole which the young larva makes is scarcely larger than a pin and is soon closed



A. 1. The outlines of an appletree split in two, showing the inside of a longitudinal section. 2. The burrows of the borer. 3. The borer at the upper end of the burrow. 4. The pupa waiting for the proper time to emerge from the tree.
B. The apparatus for introducing the liquid. 1. The funnel. 2. Gum-elastic tube. 3. Nozzle.
c. Saperda bivittata; *b*. Pupa; *a*. Larva.

by the growth of the tree. These larvæ remain in the tree perhaps four years, penetrating the wood and making excavations more and more. At this time, we believe it is next to impossible to kill the larvæ by the use of wire or pliable sticks as is often recommended, because their course is closed up after them by their "excretal discharges in the form of agglutinated saw-dust." The *debris* so often referred to as a means of detecting their presence, is more frequently a means of detecting the beetle's escape after it has perpetrated the damage of a three or four years' residence in the bark and wood while in the larval state.

Mr. RATHVON, in an essay upon "Insect Longevity," delivered before the Pennsylvania Fruit Growers' Society, refers to a self-operating plan for the destruction of this insect, the explanatory cut of which we here produce. The funnel-shaped reservoir is hung in the lower branches or at least elevated a foot or more above the base of the tree, connected by an elastic hose with a "tapering nozzle spirally grooved, forming a coarse screw." This is to be screwed into the infested part and the reservoir filled with any liquid that will kill the borer—such as tobacco water, or a carbolic dilution. The liquid will tend to rise in the burrow to a level with that in the reservoir and will gradually make its way through the saw-dust excrement, finally reaching and killing the borer.

Mr. RATHVON thinks that water alone would be effectual though requiring a longer time. However effectual, the plan is attended with too much trouble and expense ever to be put into general use, or it would have been popular long since. Prevention is the best cure for the apple tree borer and a strong wash of lime, tobacco, carbolic acid, potash and the like, applied often between the 1st of June and 1st of August will generally render the use of sticks, wires and reservoirs unnecessary.

Industrial Implements.

STEAM POWER FOR FARMERS.

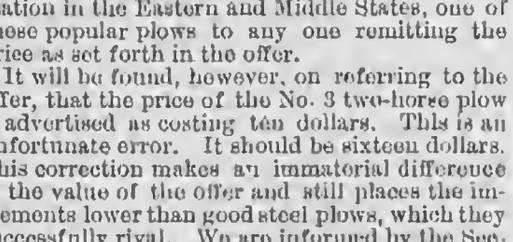
WITHIN the past few years steam power has become as much of a necessity on the farm as the wagon, and without it there would be no possibility of securing the crops or fitting them for markets, especially on the large farms of the West. To supply a growing demand for such a power, great improvements have been made of late in the construction of agricultural engines as well as in the facilities for their manufacture, and now there seems to be little that is desirable in such a machine that has been omitted in construction. Those made by the Oneida Iron Works, at Oneida, N. Y., are deserving of especial attention from those contemplating the purchase of such an engine. The company is co-operative in its organization and composed wholly of practical mechanics in the various departments, who have the advantage of over twenty years' experience. The building and tools of the company were constructed for the manufacture of engines, and being supervised solely by themselves in all their details, with a thorough knowledge of the power required for the various purposes of agriculture, it is not to be wondered at that their machines have taken such high rank among farmers.

Their engines are no mere experiment, but are constructed upon well-known and tried principles, embodying simplicity, economy, durability, safety from fire; are easily managed, and consequently not liable to get out of repair. All material used in their construction is of the best, and the workmanship unexcelled. While they make a specialty of mounted engines for agricultural purposes, they at all times keep a full assortment of portable and stationary engines, from three to fifteen horse power, suitable for all uses. Being established in the center of the great dairy district of New York, they know from experience just what is required for a cheese factory or creamery, and can furnish such power at all times. As a shipping point, Oneida is one of the best in the country. Engines may be shipped to any point without delay and at very low rates.

THE SYRACUSE PLOW.

THIS chilled plow has met with great favor, especially in the State of New York. Owing to the intense competition among manufacturers, and the fierce activity of agents, the farmer has ample opportunity to test plows. Therefore, one that retains its popularity, and increases in favor, must have sterling qualities. The only satisfactory test of an implement of this kind is its actual performances in the field under various conditions of soil and circumstances. We gather from testimonials sent to the Syracuse Chilled Plow Co., Syracuse, N. Y., many of the names of the writers of which are known to us, that this plow has done satisfactory work in muck bottoms; that the ground is left in fine condition; that its ease in handling and working on stony ground is the subject of almost extravagant praise; that it works equally well in sod as in stubble; that its lightness of draft, and holding to the ground, when it is hard and dry, are prominent and valuable qualities. The scientific construction of the plow, and the excellent material used in its manufacture, guarantee durability.

An excellent feature of the plow is the jointer, and it would be greatly to the advantage of farmers if they gave more careful attention to the



use of this convenient part. To use it to the best advantage the jointer standard should be set nearly perpendicular, and arranged to cut a furrow slice not over two inches deep. This furrow slice will be turned over into the bottom of the furrow, and the mold board of the plow will then turn its furrow over upon top of it, completely burying it with all the weeds, manure, clover stubble, sod, etc. turned under, out of sight, and the top of the ground will be left even and light. In sod, the ground once plowed this way is light and mellow, and the harrow will not drag up the turf.

Referring to an announcement made in this journal in a previous issue, it will be seen that the manufacturers make a very liberal offer that comes most appropriately to those who need good farm implements at this season, but are victims of the present financial stress. This company propose to send, during thirty days, from March 12, free of all freight charges, to any railroad station in the Eastern and Middle States, one of these popular plows to any one remitting the price as set forth in the offer.

It will be found, however, on referring to the offer, that the price of the No. 3 two-horse plow is advertised as costing ten dollars. This is an unfortunate error. It should be sixteen dollars. This correction makes an immaterial difference in the value of the offer and still places the implements lower than good steel plows, which they successfully rival. We are informed by the Secretary of the company that the spring business is something unprecedented, notwithstanding this company has been noted, during its short existence, for enormous yearly sales. It will be lack of ordinary foresight not to embrace so unusual an opportunity.

THE SYRACUSE ENGINE TRIAL.

THE report of the Committee on Farm Engines at the Syracuse trial has been received. This test was made under the auspices of the New York State Agricultural Society. The report which is quite voluminous, will be condensed and its most important features printed in these columns. In this issue we can name only the successful competitors. In the first class The Fishkill Landing Machine Co., and G. WESTINGHOUSE & Co., Schenectady, N. Y., take prizes B. W. PAYNE & SON, and the Porter Manufacturing Co., secure the honors in the second class.

THE Blanchard Churn, so long before the dairy public, and holding its rank despite multitudinous new inventions and improvements, has lately improven upon itself slightly by a modification of its interior arrangements. Its yearly sales have steadily maintained a high aggregate figure, and now, for the present season the already reasonable price at which it was sold has been reduced, placing the churn within the reach of the many. Circulars and prices will be sent by PORTER BLANCHARD'S Sons, Concord, N. H.

CHAS. MILLER & SONS, Utica, N. Y., are a firm thoroughly well known throughout New York State, but to others of our readers who are in occasional want of dairy supplies, we may suggest that the facilities of this firm are most complete. They especially make a varied display of cheese vats, graded to every capacity. Circulars descriptive of their entire stock may be had free on application by mail.

The Poultry Yard.

REPLY TO MR. WALLACE.

I SEE no particular benefit to anybody, to reply in detail to Mr. WALLACE, as all that he has adduced is too vague to be considered as throwing any light on the native country of the Light-Brahmas, which would be interesting to discover. I presume that they originally came to this country from India; but from what part of that country has never been shown, nor that any such fowls exist in any part of it.

Mr. WALLACE proposed to quote from two works to show that Light Brahmas existed long ago in various countries, but as he admits, he had no such books in his possession; and one of them, he says, was published over *sixty years ago*! even if he had quoted direct from the books, as he wrote to the RURAL, there is no evidence that the writers referred to the Light Brahmas. He says the fowls were called "*Light Hindoos*." Now, if such fowls ever did exist in India, why is it that no account of them ever reached either England or the United States, through the poultry books and papers of these two countries?

Mr. WALLACE will please to excuse me from any further notice of his claims, as they are in my opinion, too unsubstantial to be seriously argued; but if he can hereafter produce any *new* information bearing on the question, the fowl-breeders of this country will, undoubtedly, be interested in reading it.

Linden, N. J. T. B. MINER.

New Advertisements.

BROWN'S BRONCHIAL TROCHES

Coughs and Colds.

"Brown's Bronchial Troches" will allay irritation which induces coughing, and gives immediate relief in Bronchitis, Catarrh, Influenza, Hoarseness, Sore Throat, and Consumptive and Asthmatic Complaints. The Bronchial Troches have been steadily winning their way into public favor, until they are known and used nearly all over the world.

TROTTING STOCK
AT AUCTION,
Without Reserve or Postponement.
WEDNESDAY & THURSDAY,
March 27 and 28, 1878,
Commencing each day at 11 o'clock, A. M., at the American Institute Building, on Third Avenue, between Sixty-third and Sixty-fourth Streets, in the City of New York. The animals comprise
ABOUT 90 HEAD
OF THE MOST
Meritorious and Fashionable Breeding,
believed by the subscriber to be incomparably superior to any considerable lot ever heretofore offered at absolute sale. They are selected (not culled) from the studs and stables of several well-known Eastern breeders and owners, in whose interest they are offered, and whose names and residences appear as vouchers for the pedigrees and statements regarding each animal in the catalogue, all of which are recorded in the Trotting Register.
The Stallion list includes the famous **King Philip**, that has the fastest stallion record in the Hambletonian family by the direct mail line; also the brilliant young sire **Kentucky Prince**, unsurpassed in record and performance of get by any stallion of like age; also the three-year-old colt **Inheritor**, by Jay Gould, out of the noted turf mare Lucy; also three young sires by Rysdyk's Hambletonian, all out of mares tried very high as producers; two by Backman's Messenger Duroc, out of superior mares of Clay and Star blood; one by Edward Everett, dam by Rysdyk's Hambletonian; one by Middletown, dam by American Star; and others of great worth.
The broodmares include daughters of Rysdyk's Hambletonian, Middletown, Almont, Woodford Mambrino, Green's Hambletonian, Rysdyk, Sackett's Hambletonian, Conklin's Star, and of Lucy Almack. The mares and fillies otherwise classed include daughters of Kentucky Prince, Rysdyk's Hambletonian, Messenger Duroc, Almont, Blackwood, Jay Gould, Aberdeen, Ajax (brother to Walkill Chief), Thornedale, Strideaway, Edward Everett, Billy Denton, Knickerbocker, Rysdyk, Woburn, etc., and likewise fashionably bred on the side of their dams.
The Trotters, Roadsters and growing stock range in speed from ability to beat 2:20 to animals barely broke to harness, and others entirely unhandled.
All the stock is pledged to absolute sale.
No postponement on account of weather.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

The March sun comes streaming in strong and cheery. It shines upon the kitchen fire, and the wood seems to burn dull and black—too early—we must put in a pine stick and coax a blaze. *Next* month I should not wonder if in the hurry of gardening, I have to announce that the fire is out, between meals. Ah! now it is getting bright and warm, sending out its pleasant glow, till the kettle begins to "hum" as pleasantly and full of suggestions as Mrs. Peerybingle's, and promises a cup of good tea. And here comes "Tilly" to *infuse* it, as the old housekeepers say. Rinse the teapot with hot water, child; now a teaspoonful for each person and one for the pot. Just a little water, and set the teapot which is best of brown earthenware, upon the tea-kettle, in place of the lid. Then the steam from the boiling water will bubble under it, and draw out all the strength. It must be covered with a "cosey" when you set it on the table to keep in the heat and aroma of the choice leaves you have infused. Don't know what a "cosey" is? Do you see that gay, scarlet cloth cap on the side-board? It *does* look like a Turk's cap a little, but made to fit our teapot. Very gay? Yes it was a gay friend of mine who made it and embroidered it with gold thread. It is thickly wadded and lined with scarlet flannel, with a stout cord of gold and scarlet drawn around the bottom. When it is in use, it is quite ornamental and will keep the tea hot for an hour, or more as I have noted by experience, when by any chance a member of the family has been detained from the table.

Are the children to have tea? No, "Tilly." Not a child of mine takes any such beverage. Of course, if milk were scarce I might give them something else, but we keep a good supply of milk for the family to use, and that is their best drink. When I was a little girl, a certain enterprising grocer of the town where I lived, caused to be inserted in the daily paper this rhyme:

"When you start in the morning to travel by rail,
Or by steam take a trip to the sea,
No perfume e'er wafted from Araby's gale
Smells then like a cup of good tea."

I thought *then* that Cowper's cup that "cheers" was a treat I should enjoy when I grew older, but have since, with wider knowledge, learned that my robust-childhood and freedom from what are known as "children's diseases," are largely due to the pure sweet milk that was my daily beverage. Put in a log "Tilly;" we do not need the kitchen fire any more just now, and these thoughts have taken me back to other days that seem *now* but a dream.

COOKING AN ART.

Whosoever would become a good cook must give the mind to it and in order to excel in this branch of domestic economy, one must have, or cultivate, a taste for it. Seasoning is the most difficult part of cooking. One may know how to stew, roast or broil, but to know well what seasonings or spices to add which will improve the flavor, requires patience, practice, and I may add ideality.

Again, badly cooked food is sheer waste of material, strength and nerve. What mother can justly expect to rear rosy, happy children upon sour bread, indigestible meats and rich pastry! No woman should take upon herself the duties of wife or mother, without a thorough knowledge of this art, and no woman's education is complete, however brilliant, if this branch be neglected. If mothers taught their daughters from the first that it was as much of an accomplishment to manufacture light, wholesome bread, snowy biscuits or to be enabled to broil a steak to a nicety as to master a difficult piece of music, or one of the languages, there would be fewer divorce cases, fewer complaining husbands and miserable unhappy wives.

Mrs. Mary Olin.

UTILIZE THE CANS.

Old tin fruit and vegetable cans, have been thrown into the back yard and alley long enough. Instead of disposing of them in this way, they can be used for flower-pots, and may be made very ornamental too. Here is an opportunity for a display of the "Decorative Art," at present, so popular. The plants will thrive if a hole is made in the bottom of the can, quite as well, I find, as in porous pots. The rust from the tin is more of a benefit to the plants than otherwise. They may be painted any color (I like brown and black), with pretty pictures pasted on. I am reminded of a window I passed, which was filled with blooming plants, in tin cans. I knew that they were Pelargonium Roses, Petunias and Pinks but the labels said they were Canned Pumpkin, Lima Beans, Lobster, Corn, Oysters and Mackerel. Better the bare cans than the labels and pictures representing the original contents. M. G. R.

CHEESE FROM SOUR MILK.

Not having seen any directions for making cheese from sour milk in the department devoted to Domestic Economy, I venture to give my way for doing the same. I know from experience how the tired and overburdened farmer's wife often racks her brain for something to fill out her meager bill of fare, when time is precious and every step counts. I have been so benefited myself by a recipe or suggestion from some one more experienced, that I add my mite hoping it will be tried by those who are in the habit of making cheese from sour milk. Take a pan of thick milk after it has been skimmed, place it over a kettle of boiling water, after cutting it in squares with a knife. Let it stand until thoroughly heated, then set aside until cool and pour into a colander or sieve to drain. When the whey has drained off turn into a pan, pour on plenty of cold water and let it soak two or three hours. Drain again and then with a fork mash fine, season with salt to taste and stir in a few spoonfuls of thick, sweet cream. Beat well with the fork and turn into a dish for the table, putting it on ice or in a very cool place before serving. Mrs. S. G. H.

Corning.

DOMESTIC RECIPES.

Cocoa-nut Cake.

Three-fourths of a cup of butter; two cups of sugar; five well-beaten eggs; one and one-half cups desiccated cocoa-nut; one-half cup of sweet milk; three teaspoonfuls of baking powder in three cups of flour.

Cheap Raisin Cake.

One egg; one cup of sugar; one-half cup of butter; one teaspoonful of soda in one cup of buttermilk; two cups of flour; one cup of raisins; one teaspoonful each of cloves, allspice and cinnamon.

To Boil Parsnips.

Scrape or pare the parsnips and cut cross-wise in slices one-fourth inch thick; put them into a kettle with as much slightly salted water as will be cooked away when they are done—great care must be taken that they do not burn; when very tender dish up and put butter, pepper and sweet cream on them. Mrs. S. C.

Savannah, N. Y.

QUERIES ANSWERED.

Can you give me the recipe for Javelle water?
Dansville, N. Y. Mrs. E. J. G.

Ans.—Put two pounds of sal-soda into a kettle; pour on two quarts of boiling water, and boil fifteen minutes; add one-half pound of chloride of lime; when cold put into a jug and cork tightly.

How shall I clean children's white kid shoes?
Akron, Ohio. Mrs. Mary Brown.

Ans.—Empty a small quantity of hartshorn into a saucer; wet a piece of white flannel in it and then rub on a piece of white soap; rub the shoes with this, and as the flannel becomes soiled take a fresh piece.

What will remove soiled spots from bed ticking?
City.

Ans.—Rub starch in thick with a wet cloth, and put the ticking in the sun. When dry, rub well with the hands. It may be necessary to repeat the process.

Everywhere.

TALKS UPON THE PRAIRIES.

Good Advice to Emigrants.

FRONTIER.

Few count the cost of a free homestead on the frontier. The Government gives each head of a family or a single person twenty-one years old, one hundred and sixty acres of land, for only about the cost of survey, upon the condition that the recipient of Government bounty occupy that land for five consecutive years. This is a gift really of about $186—a liberal provision, on the part of the Government. But it is well enough for a shrewd man to take even a "gift horse," a little one side and quietly look him in the mouth, provided there is a long winter before him. While the Government makes a free gift in good faith, the homesteader really pays a high price for all that he gets.

On the cost side we shall find a large number of items like the following: First, serious exposure of families to all the vicissitudes of a changeable climate, with inadequate provision for protection. Second, living for years in small and uncomfortable cabins or "dug-outs," roofed with sods, involving a series of discomforts, to be understood only by those who have endured them. Third, coarse and short rations may be counted among the usual conditions of frontier life. Fourth, while the perils from prowling Indians can now be scarcely counted, there are, even yet, localities—where frontier families must keep their powder dry. But these are unworthy of mention by the side of another item—that is, the loss of the privileges of civilized society. This loss is felt most by the children; for they must form their habits and tastes with the rudest surroundings. In most cases, they will have small opportunities for culture. You would understand this better if you should see as the writer has seen, young men of eighteen or twenty reading in the same classes with children of seven or eight years. No after-training can obliterate the effects of these wasted early years. In too many cases the child receives a harmful bias, that must shape all after life.

We have a class of men who have always lived on the frontier, as their fathers did before them. They will move on as often as they can sell out their claims, until there are no more claims to take or "jump" on this side of the Pacific Ocean. They realize no great loss in frontier life, but to a man of culture, everything about him tells of loss. Few of us would like to have our children trained to such a life. And parents who prize the privileges of society in their quiet Eastern homes, as they think of the future of their little ones, will pause long before they will lead their families to a frontier home at such a cost. There is, however, one redeeming fact—that all do not suffer alike by rough surroundings. Culture and refinement within the family circle is potent for good on the frontier as well as elsewhere.

While I would not discourage any energetic man with or without a family in regard to coming West, let me say to all our Eastern friends, remember that there is

A BETTER WAY TO "GO WEST,"

than to rush at once to a homestead upon the distant frontier. It should be remembered, in all cases, that a man without money cannot support a family easier here than in the East. Hence, a man with a family proposing to come West should have at his command a few hundred dollars,--enough to provide himself with a team and support his family for a year, at least, free of debt. If you have so much or more, and are disposed to come West, let me whisper in your ear, not to bind yourself up to some plausible emigration scheme. Some oily-tongued Mr. Winksharp may tell you a great deal about a company which he is forming to settle a delightful region about a thriving city, which the thankful settlers have insisted, as a very inadequate token of their respect, shall be called "Winkfastfield," and now if you will only go rightthere, you will find the people all ready with open arms to receive you. And as he has become specially interested in you, and "knows that you will make with your excellent wife and beautiful children, a valuable accession to the very refined society of Winkfastfield," he is willing to have reserved, for a very reasonable consideration, until you can examine it, one of the best quarter sections in all that region, only five miles from the city. This may all be very kind on the part of "Mr. Winkfast;" but don't invest. These emigration projects may look very plausible at the East, but they are bubbles, that have all an unfortunate way of bursting here. Stand clear of both the schemes and the men who push them.

Unless you have friends to whom you can bring your family, it is far better to come in advance and select a temporary home for them. It is quite essential that you seek only a temporary home at first. There are several advantages in this. It may be your purpose to ultimately secure a good farm. By selecting a temporary home in some thriving town for a few months or even a year, you will have ample time to make your selection. You will know better after a few months what you want, and at the same time learn more fully what you can do, thereby escaping the otherwise almost inevitable imposition. By this course you will be able to throw yourself more out of the friendly (and disinterested?) grasp of land agents. You will find in this class many honorable men, but it will be well for every immigrant to remember that it is the business of these men to sell land, and if in their power, they will sell you a farm whether you really want it or not. Avoid all hasty conclusions with these men. Know beforehand just what you want, and take things cooly with land agents. If the immigrant does this, he will thank "Frontier" sometime for his advice. If you have little money, do not lay it all out in land, but get a good team, a few farm tools, a few good cows, and rent a farm convenient to market, for a few years, or even work some land near town for a year, until you can rent a good farm. Depend upon it, this is a better and a safer course for a few years, than to be burdened by exorbitant interest and heavy taxes.

NOTES FROM KANSAS.

A large number of people, many of whom are subscribers to the Rural New Yorker, have written to me from the East, making inquiries about lands in Southern Kansas, and thinking the columns of that valuable paper would be the best medium through which I could reach all, I will, in a rough farmer's style, state some of the advantages of this, the most fertile valley in the West.

The winter has been very mild, as they generally are: indeed, wheat has grown all the time. It looks as green now as in April or May; the ground is entirely matted. In riding over this country, Rural readers would be surprised to see the immense fields of growing wheat. They cannot realize the beauty and fertility of this Great Arkansas Valley, unless they were here to see it for themselves. This county (Sumner,) the garden of this Valley, has about 100,000 acres of growing winter wheat, and if nothing befalls it before harvest, we shall have a large yield. Our average crop is from twenty to twenty-five bushels per acre.

This county was settled in the fall of 1870. In September 1871, it was organized with a population of 250; to-day it has 12,000 inhabitants. It lies in the southern tier of counties and is about 130 miles from the east, and 230 miles from the west line of the State.

It contains an area of 1188 miles. Much of it yet belongs to the U. S. Government. Of this any one who is 21 years of age, can secure 160 acres at $1.25 per acre by living on the same six months. Or they can purchase farms with some improvements at sums varying from $800 to $2500. In speaking of a farm what is meant is a quarter-section. There are many in the East with a small capital who could do well here, and there is no field so inviting as this Valley. In three years these lands cannot be purchased for anything like the above figures, and no more lands can be secured from the Government.

The Soil is a rich black loam mixed with sufficient sand to prevent baking. This loam is from two to six feet deep; under this is a subsoil of clay, gravel, loam, and sand.

Streams and Water.—This county is well watered having about 250 miles of streams which are equally distributed through the county. The rivers are the Arkansas, Nenescah and Chicaskie; the creeks are the Slate, Shoo Fly, Bluff and Fall, and their tributaries: springs, are numerous. Water can be found in wells, on every quarter-section, at a depth of from ten to forty feet.

Timber and Fuel.—The larger streams are skirted with timber belts, reaching back from a quarter of a mile to a mile. They consist of Black Walnut, Mulberry, Elm, Ash, Hickory, Cotton-Wood and Sycamore. Wood can be secured at $3.50 to $4 per cord; posts can be had at ten to fifteen cents. Fences are not required, as we have the Herd Law in force. Thus, farmers can commence operations at once, after securing the land and the team.

Fruit.—Kansas has secured a reputation for fruit, second to none. As yet this county is too new to contain many orchards of bearing apple trees; but those that have borne are of an excellent quality. Cherries, Grapes, Strawberries, Blackberries and Raspberries have been tried: the fruit is luscious and the crop is abundant. Our peaches cannot be surpassed for flavor. They are equal to the peaches of Georgia. It is astonishing how rapidly trees grow: one can have a grove in three years.

Cereals, &c.—Wheat is the staple product, yielding from twenty to forty bushels per acre, and this on sod ground when broken in May, June, and July, and sown in the fall. Corn yields from twenty-five to eighty bushels per acre; the bottoms along the streams prove the best soil for corn. Oats seldom fail to yield from twenty-five to sixty bushels per acre. Rye always does well, and affords a splendid pasture for stock during the winter. Sweet potatoes do well, yielding largely; they reach the highest state of perfection and are equal in size and flavor to the Carolina potatoes. Early Irish potatoes do well and yield largely; Peach Blows and late varieties do well on the bottoms near the streams. Peanuts yield from 100 to 150 bushels to the acre; vegetables do well.

Stock-Raising and Grasses.—Timothy, Bluegrass, Alfalfa, Red and White Clover all do well. The nutritious grasses that grow spontaneously over these broad prairies have never been utilized. This county is favorably situated for stock-raising: lying adjacent to the Indian Territory, cattle can be kept there the year round at a cost of $3 per head.

Climate and Health.—We have a climate which suits all, and healthfulness is a feature not to be ignored by the sufferers from miasma in low marshy districts. Our people had a few chills when the country first commenced settling up, but these have been scarcely known since the lands have been broken and cultivated.

BUILDING MATERIAL.—Nature has thrown up in mounds, here and there, stone in sufficient quantities to supply the wants of all; it is magnesia limestone. Brick of an excellent quality is also made.

CHURCHES, SCHOOLS AND SOCIETY.—Almost in every school district there is a church organization. At this point we have five church organizations, consisting of the Presbyterian, Methodist, Baptist, Christian and Catholic. The white school-houses can be seen dotting the prairies in every direction. We now have about 100 in this county. Society here will compare well with that in many old counties in the East.

TOWNS, RAIL-ROADS, &c.—Wellington is the county-seat and on Slate Creek; Oxford is on the Arkansas River; Caldwell on the Chicaskie; many other thriving towns are yet in their infancy, but are destined to become populous and wealthy. Our nearest Rail-Road point is Wichita, a distance of 35 miles. From that place there is a line of daily stages to this and other points in the county. EDEN.

Oxford, Sumner Co., Feb. 25.

WHERE IS THE BEST LOCALITY FOR FARMING?

NELSON BITTER.

SYRACUSE, N. Y., Feb. 23.

MY article published in RURAL of Dec. 29, has called out several inquiries, by mail, as to the best place for "new beginners" to locate a farm. It will save my time, and perhaps interest an occasional reader, if I answer through the columns of the RURAL.

I would as soon attempt to choose a "wife," for another person, as a farm. It would be just as wise to warrant perfect satisfaction in the first instance, as in the second. There is such a variety of opinions as to the most favorable localities, such a diversity of soils, even in the same neighborhoods, so many endless and conflicting questions to settle, that the wisest may well hesitate before making a selection, even for himself, but to choose satisfactorily for another is attended with still greater difficulties.

Every person has his own peculiar notions, that are to be taken into account; his likes and dislikes to be considered, and his prejudice to be thought of. One man thinks nearness to market the main consideration; another wishes to locate where land is cheap, so that he can own a large tract of it; and still another's greatest desire, may be to settle in his own native State, surrounded by his relatives and friends. Some young men wish to stay near their father, that they may be benefited by his counsel, and—if worst comes to worst—receive aid from him; others desire to strike out independently, and rise or fall by their own exertions.

I must confess that this latter class have my sympathy. When a young man, I spent several years in a dozen different States, looking for the very best place to locate. California I found to afford many advantages; Oregon the same; Nevada, Kansas, Idaho, and Nebraska, all have many desirable points. Michigan, Wisconsin, Iowa, and in fact, all of the Western States possess plenty of good land, with almost every variety of location. I finally settled down within twenty-five miles of the place from which I first set out. My present location is very satisfactory to me, but yet, very likely it is not—in the opinions of other people at least—the very best that could have been selected. The fact is that owing to there being so much that is good and desirable to choose from, it is impossible to select the very best; or—if a reasonable amount of caution is used—to entirely fail in finding what will prove satisfactory. A more competent judge than myself says: "We cannot select any particular locality as better than another, while advantages and drawbacks are so variously intermixed, and while different places are fitted to the peculiarities and preferences of purchasers." I think one should be governed, to a certain extent, by his predilections.

To illustrate: I would sooner climb the hills of York State, wrestle with the rocks and stones, which we have in such great abundance, than to face the fearful winds that prevail throughout the Western States, while it is altogether likely that the average Western man who can plow a whole section without finding a stone large enough to throw at a bird, would decide quite differently. Again, I have a certain pride in being a citizen of this Empire State, the most populous and wealthy of them all. To quote the language of another: "No wonder it is called the Empire State! Think of its grand natural beauties! Its eastern boundary is followed by the majestic Hudson; on its western, thunders the cataract of Niagara; its northern boundary is formed by that great inland fresh-water sea, Ontario, and the noble St. Lawrence, with its wondrous thousand islands. Through its center is scattered the loveliest line of lakes—a score or more in number—besides Watkins and Havana Glens. It is also rich in waterfalls: Genesee, Trenton, Portage, Tanghanic and many others of lesser note."

One can well be excused for hesitating, before abandoning all this loveliness—not half enumerated above. But persons will, perhaps, exclaim: "All sentiment, and it will not help one to earn a living," which is true; but it certainly renders life more pleasant and happy to look upon so many beauties. Take all the poetry and sentiment out of our lives, and compel us to consider only "what we are to eat, and wherewith we shall be clothed," and this life will be a humdrum affair certainly.

I will drop a few hints that may be of some service to new beginners. When one intends to settle in a location with which he is not familiar, do not be in too great haste in buying. Better wait a year, at least, and study carefully all the advantages and disadvantages of the locality; notice the crops grown, the expenses of marketing etc., etc., and finally when you buy, buy the very *best* land to be procured, remembering the dearest land is often the cheapest in the long run. The most productive land not only pays the best while in your possession, but is also the most salable, should you desire to change your locality. Do not buy too much land. This is the rock upon which many a new beginner has been ship-wrecked. In the West especially has this been too true. With those who have had no experience in farming the greatest caution is necessary. Unless they have capital sufficient to enable them to farm it for several years at a loss, until they have learned the business, they had better hire a farm for a few years or else—what is perhaps better still—work for some successful, practical farmer, until they have learned the *modus operandi*. My object in offering this advice, is by no means to discourage any one from engaging in farming, but to assist them, if possible, in making their undertaking a successful one.

NOTES FROM SOUTH CAROLINA.

I DON'T think the friends of the RURAL properly appreciate, or rather avail themselves of, all the advantages which might be derived from the column, which has been set apart for correspondents from "Everywhere." I regard this column, as a sort of puplic reception-room, where every one is free and easy, and at liberty to address his neighbor with all the freedom of polite intercourse, while the neighbor would be deemed uncivil not to respond in the same spirit. For instance, I would ask my neighbor: "Where are you from? Excuse me, but is your country a desirable one to live in? What are its advantages, and disadvantages? How is the society morally, and intellectually? What are its resources, developed and undeveloped? How about its healthfulness, climate, water, soil," together with a thousand other questions, more in detail, which would be interesting and instructive to one desiring information, and in addition to contributing a useful fund of information, would awaken an interest in, and cultivate a friendship between individuals from different sections of our country now again united, which could not be but productive of good.

Well, to follow out this suggestion, I will jot down a few notes concerning this part of the world.

This place is a neat little country village, which has sprung up around a most remarkable mineral spring, containing lime, magnesia, and sulphur, in their various combinations, and whose waters are claimed to be efficacious in diseases of the stomach, liver and kidneys, and are much resorted to. It is situated in Spartanburg county, one of the Piedmont counties of the State, about twelve miles from the Richmond and Atlanta Air-Line Railroad, and is easily accessible from the town of Spartanburg. Spartanburg county is one of the largest, and most important counties in the State—important for its location, and for its wonderful resources in agriculture, manufacturing facilities, and mining, the last two of which are as yet almost entirely undeveloped. To give an idea of its water power: there are five large streams; two, the Broad River and the Enorce, bounding it on the east and the west, and the others running at about equal distances through its length, and all of them, intersected by ledges of gneiss rock running at right angles with the streams, and at regular intervals along them, like the steps made by some Cyclopean giant up to his home in the Blue Ridge Mountains. And yet the country is by no means mountainous or rugged, except in the northern part, near the mountains.

Prof. OSCAR M. LIEBER, in his Zoological report of the State, mentions by name, some regular shoals in those streams, ranging from five to eighty-five feet fall, in from three to sixty chains—and Prof. TOURNEY, speaking of those in the Enorce River, the western boundary of the county, says: "At Gordon's Mill the falls are thirty to forty feet in 200 yards, and a few miles higer up, at the Mountain shoals, there is a fall of seventy feet in about the same distance, and at Van Patton shoals the river falls fifty-five feet in about one hundred yards. So very even is the edge of the rock at those, and in fact, all of the shoals made by the gneiss rock, that it forms a natural dam across the streams which it crosses, and it is impossible to examine these localities without being impressed with the great facilities which they afford, at small expense, for manufacturing purposes.

Besides these falls there are a number of mines of gold, copper and iron—iron of the best quality, and gold, if scientifically mined for, would be more permanently remunerating than the auriferous deposits of the Pacific slope; and to cap the whole, we have at Limestone Springs the itacolumite or flexible quartz, a sure concomitant of the diamond that, as yet, never has been found.

This is the place, which that great-hearted philanthropist, PETER COOPER, has recently expressed an intention to donate to the State, for a private school, like his Institute in New York, and we are sure when it gets into operation, diamonds of the first water, will then, at last, be plentiful.

Weather like spring; indeed, we are all gardening. J. W. S.

Glenn Springs, S. C.

NOTES FROM NEBRASKA.

READING Prof. SHELTON'S article from Manhattan, Kansas,—"A Kansas Orchard,"—I am reminded of a promise to give you an occasional article from the "Twin Sister State," Nebraska.

We have had a remarkably open, mild winter thus far, in fact, scarcely any weather we could call winter. This has really been what we never before had, a wet winter. Frequent rains, and snow which melted away quickly, leaving the soil in excellent condition for the coming crop season. Some early spring wheat has already been sown. The fruit prospect was never so promising as at present date. Our fruit ordeal, however, is yet to come. March is the critical period for fruit in this State. When prematurely advanced by the warming influence of mild February and early March weather, we are sometimes caught by a cold snap in the latter month, that blights fruit hopes. We anticipate a glorious crop season, however, for 1878.

Our first State Agricultural Institute has just closed a two weeks' session at Lincoln, the capital. It was a grand success. There was a general attendance from all portions of the State, of representative men and minds. It was a pleasant and profitable blending of the practical and scientific. The active farmer and the Professors of the State University worked hand in hand. The former to present experiments and results, and the latter with scientific reasons. The whole range of agriculture, horticulture, forestry, stock-raising, general crop and fruit growing, soil and climate was gone over. A vast amount of valuable information was imparted and obtained. The Institute was gotten up and conducted under the auspices of the State Agricultural College and Experimental Farm, presided over by Prof. CULBERTSON, a young graduate of the Agricultural College, at present filling its chair.

We boast of rare advancement in all referred to, and under discussion, during the Institute. We are particularly proud of our success in fruit culture. Instances were presented of an income of two thousand dollars per acre, in apple growing. Two thousand bushels of apples were gathered from one hundred trees, eighteen years old, growing on an acre of ground, and the fruit sold for one dollar per bushel. This, of course, is rare, but it shows what can be done.

Great attention is being given to stock growing—cattle, hogs, and sheep particularly. Within a few years past, the finer strains of horses have been introduced, and with gratifying success. Wool growing is also becoming an important factor in our products.

This State is enjoying an unusual influx of immigration the present season. The fertile, cheap lands are attracting the attention of your over-crowded portions of the country, and the people are coming by the thousands. They are welcome. With industry and a few years of perseverance, they will be surrounded with all the needful comforts of life.

ROBT. W. FURNAS, Pres. Neb. S. H. S.

RURAL SPECIAL REPORTS.

BURLINGTON, Neosho Valley, Kansas.
February 25, 1878.

WE have been having some very nice weather for the last ten days so that the roads are getting good again. Some farmers on high prairie have commenced plowing already, and others are getting ready to plow in a few days.

On the 25th of January we had a thunder and lightning storm. The lightning struck one house in the county. It struck the roof about half way between two lightning rods, and passed through the house into the cellar. There were a number of persons in the house at the time but none was injured. The rail-road is being pushed forward very fast. Owing to the high water in the river the abutments for the bridge cannot be finished as soon as expected. Burlington is the liveliest town in southern Kansas. Large business houses and another hotel are to be put up this spring. A large quantity of red ochre of the finest quality has been discovered about four miles from Burlington, by the graders on the new railroad. Some of it was sent to Professor WILLIAM KEDZIE who said it was of the best kind. It has been known for some time that the best of fire clay and also yellow ochre were to be found in large quantities in the county. About ten days ago there was quite an excitement in the county south of this, over a gold and silver mine discovered near Yates Center. As near as I can learn from the reports, the precious metal was found about seventeen feet from the surface, and quite a large vein of it. Some are going to have silver whether the Silver Bill passes or not. A short time after it was found, over a thousand persons arrived there in one day. E. C. F.

FEDERAL POINT, Putnam Co., Fla., Feb. 27.

EXTREMES of temperature since Dec. 20 varying between 38° to 78°. Weather this winter uniformly cool, the thermometer ranging in the sixties most of the time. To-day a north rain, thermometer 59°. Western supplies of flour, grain and bacon shipped across from Nashville and other points by rail, are sold at about New York prices. Sweet Potatoes 35 and 50 cents per bushel. Oranges $15 and $30 per 1,000. Orange growing at favorable points in the State is becoming quite profitable to those who combine skill and some capital with unflagging perseverance, while the failure of many who were unfitted for the task and unable to meet the requirements of a semi-tropical climate and a frontier life, is freeing the business of any unhealthy speculative tendency. We command unrivaled water communication and good markets, and I cannot but believe that with the mere general use of tropical grasses and forage-plants to supplant the wire-grass of the piney-woods, cattle and sheep may be raised with much profit. Why should native grown mutton rarely be seen here when dogs form almost the only drawbacks to successful sheep husbandry? W. H. H.

SYRACUSE, March 1.

ON the 9th of last month a meeting was held in this city for the purpose of organizing a County Agricultural Society. Articles of association were adopted, and ordered filed as directed by law. The last County Society was abandoned in 1859, after twenty years of varying fortune, and no attempt to organize another one has since been made until now. From all indications this movement is to prove successful. The farmers of the county generally lend a ready support to the efforts of its managers in all suitable ways. The capital stock is $10,000 divided into shares of $10 each. The subscription to the stock will be made as small as possible, in order that many persons may be enlisted in the enterprise. E. A. POWELL, Esq. of the Nurserymen firm of SMITH & POWELL, is the President. A County Fair will be held some time in September, and in point of excellence, bids fair to excel any previous one held in our county. P. H. A.

HENRICO Co., Va., March 4.

HENRICO COUNTY, which contains Richmond, the capital of this State, is, I think, one of the best counties around Richmond. The crops are fine; wheat is looking well; winter oats are doing finely; the farmers are sowing spring oats; potatoes are being planted, and gardening is being done; the ground is in fine condition; the weather is delightful with occasional showers. Vegetables can be taken from the ground every month in the year; produce brings a good price: wheat, $1.30@1.50 per bushel; oats, 50c.; potatoes, $1; hay, $20; corn, 65@75c.; sweet potatoes, 90c.@$1 per bushel; eggs, 15c. per dozen; butter 25c. per pound; horses are selling from $50@150; cows, $25@40. Land is selling from $7@60 per acre. W. B. H.

SHERMAN, Chaut. Co., N. Y., March 11.

WE have had a very warm and pleasant winter, and March came in warm and pleasant and has continued so up to the present writing. Considerable maple sugar is being made by the farmers in this section. We had a slight fall of rain last night, but the sun is shining warm and bright this morning. An early spring is now in order. We have already heard of some farmers plowing—something unusual in this vicinity at this season of the year. M. L. D.

LAVALLE, Sauk Co., Wis., March 4.

THE weather is spring-like; robins and bluebirds have appeared. We have had no snow to amount to anything since November. The weather has been very mild, and farmers have been sowing wheat and plowing all winter. Wheat is from 90c. to $1.00; corn, 40c.; oats, 20c.; hay, $7.00; potatoes, 30c.; butter, 12 to 15c.; cheese, 10 to 12c. W. S. H.

PURPLE CANE, Dodge Co., Neb., Mar. 8.

It is now raining and thundering. S. R. M.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, MARCH 23, 1878.

We take great pleasure in announcing to our readers that we shall shortly publish a valuable contribution from Mr. J. B. Lawes, the world-renowned experimental agriculturist of Rothamsted, England.

OLEOMARGARINE.

Owing to the watchfulness of some of our best dealers in Dairy Products, a conviction has already taken place under the new statute forbidding the manufacture or sale of fat-butter without its being branded. The defence was utter ignorance of the fact that the article sold was not good cream butter. Of course such a defense could not avail the accused and he was fined fifty dollars and ordered to be imprisoned till the fine was paid.

The intention of the law is not to prohibit the sale of this article; but to prevent the public from being deceived by purchasing it for the genuine article. The statute is a good one, and should be enforced throughout the State. And so far as our observation goes, the honorable portion of the manufacturers of, and dealers in, the article, claiming for it no virtue which it does not possess, have no desire to impede the full enforcement of the law; but rather favor it. We think it would be not only policy but wisdom for our manufacturers in the rural districts to take the matter in hand themselves.

PRIVATE EXPERIMENTS WITH MANURES.

Professor Johnson states that a multitude of observations has demonstrated that from ninety-five to ninety-nine per cent. of the entire mass of agricultural plants is derived either directly or indirectly from the atmosphere; and the object of applying fertilizers of all kinds is to supply whatever the soil lacks in an assimilable form of the remaining constituents of various crops. But although the amount of food drawn by plants from the soil is trifling in comparison with that furnished by the air, still an ample sufficiency of it is essential to profitable farming, and its available presence in varying proportions makes all the difference between land entirely barren, through all degrees of productiveness, up to that which yields the most generous harvests. The more readily assimilable the plant-food in all fertilizers, the more economical is their application and the more immediate their results. The bulk of manures, although often, when large, beneficial on account of its mechanical effects, has nothing to do with their value as fertilizers, for this depends entirely on the quantity of chemical salts they contain. According to Mr. Lawes of Rothamsted, England, whose life-long study of experimental agriculture has deservedly won him a world-wide reputation, the manurial properties of a ton of barnyard manure are confined to its inorganic matter, amounting only to 62 pounds, and even in this pittance there is a considerable amount of substance of such comparatively little value as a fertilizer that he excludes it from his manure ingredients. Moreover, a great deal of the manurial constituents of dung are in an inactive form and are either slow in their effects or wholly lost. Mr. Lawes' experiments with farm-yard and chemical manures on two plots, proved that 3,800 pounds of nitrogen applied in the former, during 19 years, produced precisely the same total yield as 779 pounds applied in the latter during the same period. In other words, 41 pounds of nitrogen in ammoniacal salts produced as great effect as 200 pounds in barnyard manure.

Nevertheless barnyard manure, being a necessary product of nearly every form of farming, must continue to be the agriculturist's chief means of restoring or preserving the fertility of his land. But after every scrap of dung as well as of all kinds of refuse, has been carefully husbanded and utilized, there will still be a large field for the profitable employment of chemical manures; for it would be the hight of thriftlessness to keep stock solely or mainly for the purpose of manufacturing barnyard manure where its equivalent can be otherwise obtained at a reasonable figure.

While judicious economy is very important in the use of all manures, it is of special importance in the employment of commercial fertilizers on account of their high price and the numerous chances of their being unwittingly misapplied. This economy can be insured only by the person who uses them knowing what kinds of food which the various plants need, are deficient in the soil, and abundantly supplying what is lacking. Science has pretty accurately determined and widely published the nature of the elements which each class of plants absorbs from the soil, but experiment is the only reliable means of ascertaining the quantity of these the land contains. Nitrogen, phosphoric acid, and potash are the most important ingredients in commercial fertilizers, both on account of their cost and scarcity in the soil. Other things being equal, each of these should predominate for certain kinds of crops—nitrogen for wheat, rye, barley, oats, meadow and timothy hay, onions, sugar-beets and carrots; phosphoric acid for corn, turnips and rutabagas; potash for potatoes, cabbages, peas, beans, buckwheat and fodder-corn and rye. As the fertility of the soil varies not only in every neighborhood, but often on every farm in accordance with its natural formation and the treatment it has received, it would be well for every intelligent farmer to do at once what every intelligent farmer is certain to do five years hence—establish on his own farm a private experimental station. In reality, it would be a very simple undertaking and the fund of practical information derived therefrom would, ere long, richly reward the necessary trouble and amply repay the trifling outlay. Set apart a piece of ground of average condition, divide it into a number of plots sufficient to allow one to each fertilizer to be tested, and when the same fertilizer is tested on more than one kind of plant, allow a plot to each. Set out specimens of each kind of plant on an unmanured plot, so as to be able to judge correctly, by comparison, of the effects of the various fertilizers. Each plot need not be larger than 1-40 of an acre, or 33 feet square. By this means every farmer could demand of his land what is needed to produce the very best yield of every kind of crop, and always receive a truthful answer. It would be by no means necessary to limit experiments exclusively to chemical fertilizers, for the lack of nitrogen might be indicated by the effects of such manure as blood and flesh; of phosphoric acid, by those of home-prepared crushed bone; and of potash, by those of wood ashes. Care should be taken to sow precisely the same number of each kind of seed when experimenting on it with different fertilizers, and to apply the same quantity of manure to different seeds. By adopting such a practice, at the close of each season the mind will inevitably be enlarged, a valuable fund of practical knowledge will be yearly accumulated, and the way at once thrown broadly open to a system of economical manuring.

BREEDING STOCK ON THE FARM.

In view of the market for choice stock lately thrown open to our farmers by the exportation of cattle and meat to Europe, it behooves them to pay increased attention to the raising of superior animals on the farm. A late report on the American meat trade, by Professor Sheldon of the Cirincester Agricultural College, England, after furnishing a mass of information on the subject, comes to the conclusion that, despite some fluctuations, the dead meat trade will rapidly increase, and that appliances for its successful management will be multiplied here and in Europe. The profits of the traffic will be in a great measure, proportionate to the excellence of the product, and the limit to the quantity shipped will be the stowage capacity of vessels crossing the Atlantic; for, owing to the falling off in our imports, the number of ships engaged in the transatlantic trade will be too small to afford room for a large export of meat together with other merchandise without advancing the freight to a figure that will prohibit further exportation.

The experience of many thriving farmers all over the country, proves that a better run of animals is obtained by breeding them on the farm than by purchasing them. More care is bestowed in selecting the likely offsprings of tried animals, they will go on fattening more rapidly and uniformly than strangers picked up here and there, for it takes some time before these get acquainted and become content enough to lay on flesh kindly in their new home; and moreover, the tendency of prices for young stock is upwards, and the probability is very strong that ere long it will not pay farmers to go into the market for young animals. In any case, it is, as a rule, more profitable to breed the stock one handles than to purchase it.

PARLOR.

What horrible associations crowd into our mind when the word "Parlor" is mentioned. We immediately picture in our imagination the terrible oppressiveness of that best room, where the sun is never allowed to shine for fear of fading carpet and furniture, where the chairs have all a stately, polished and stiff look about them, where the children are never allowed to enter, where what little air there is may never be allowed to change, and where the smell is something akin to that of a family tomb. This is the best room and is too sacred for the use of the family and is only kept for purposes of ceremony and for the convenience of those people for whom we do not care a rush. People whom we like and with whom we are on familiar terms, come right into the living room and have a good chat in a pleasant way; but the ceremonious visitor, whose departure gives us relief, is ushered into the "Parlor."

The principle upon which this room is founded is all wrong. Let us have no such room in our house. Open the shutters and windows. Admit the sunlight and air. If the carpets and furniture fade, let us enjoy their use in that condition. Let us not have any tomb in our home where all should be cheerfulness and brightness. Abolish the "Parlor" and enjoy the home.

NOTES.

A Grindstone Homily.—If ever there was anything that made us wish our boyhood days were over it was turning a grindstone on which a dull scythe was being sharpened. That was before the days of friction rollers and treadles—and how our arms and back did ache! We would wonder if the thing ever would get sharpened and if we began in the morning it seemed as if we had worked long enough to have it be near dinner-time. Then we would try to distract attention from the ache, and think perhaps a hundred times more would be enough—and count one—two—three, and when the hundred were counted, feel disappointed because another one had to be commenced. There were moments of relief, when the scythe had to be examined and its edge felt from point to heel. These moments were precious to us, for they gave an opportunity to straighten up and take the kinks out of our back and arms—but they were soon put in again by the turning of the crank. But there is an end to all things, and finally the scythe was sharp. Did the owner ever look at us and notice how we sweated and looked all over? Not a bit of it. Don't believe he ever thought such a thing possible. But the first thing would be—"Now Johnnie run in the field and get those hay cocks shaken out as soon as possible!" We made a vow then that if ever we had a farm we would try to invent some machine to turn the grindstone or, at any rate, to lessen the labor, and further that we would try to remember how we felt then, and have pity on the boys.

Too Liberal.—From letters received we find that many of our readers, owing to the liberality of the offer, apparently, do not understand it. One writer says: "If the Crickst clock as you represent, is worth at least $2,50, how can you give it and the Rural New-Yorker together for $3.50 which makes the clock but $1.00?" The writer sends us $3.50 and a subscription for one year, adding, "If I am wrong please advise me." Another writes: "I send you $5.00 and two names for one year. *Now* am I entitled to the Cricket?" We give the above as examples of many. Our answer is, yes, to all. Still, without a single exception, all have expressed themselves as much pleased with the clock, and many have returned us their cordial thanks. We would say to the latter that our cordial thanks are also due to them.

Who Shall Decide etc.—The Homeopathtic Medicial Society of the county of New York at a meeting, last week, decided that its members might depart from the rigid rules of Hahnemann whenever they thought scientific investigations and research since his time had shown a better way. On the other hand, one of the Professors of a leading Medical College of the Allopathic, or "Regular" school, in a lecture this winter, told his students that many of the medical preparations of the Homeopaths were more reliable than those to be had from general druggists. It is a happy thought that all medical men may some time be willing to "Prove all things, and hold fast that which is good" without being bound by the rules of this or that society.

BREVITIES.

Frosty nights—warm days.

"Everywhere" has a benefit this week.

Similia similibus curantur is in despair!

Do not forget to set out a few rhubarb plants.

We commend the frank advice of "Frontier" to intending emigrants.

The house with modern improvements, in last issue, would cost $35.00.

In the Asparagus editorial brevity of last week, fifth line, read *apart* for *deep*.

This novel sort of a spring is respectfully solicited not to fool with the fruit buds.

On Dit, to kiss and tell is bad enough, but not to kiss and yet to tell, is still worse. Truth.

It is recommended that the pig be elevated from a neglected scavenger to a "recognized stock."

We call attention to the article "Kew Gardens" on page 190. When may we hope to have a garden like it in this county? Some day?

Do not plant trees deeper than is necessary to cover the roots well or than they were planted in the nursery rows. Never place the roots in contact with manure.

We wish to impress upon our friends the importance to them of experimenting with commercial manures during the present season. What fertilizing principle does your land stand most in need of? You can solve this question for yourselves at a very small expense.

Plant Peas. Philadelphia for earliest. Early Dan O'Rourke is better, but a day or so later. Laxton's Alpha is early and good. McLean's Little Gem though not so early is the best of early peas. Eugenie is a good intermediate variety. British Queen is one of the best late varieties. For succession it is well to plant all of the above varieties at once.

We presume—we hope, at least—that the time is past for a little season, for telling farmers to stop up the cracks in their barns. Let's rave about Gentle Spring for a week or so—then the heat of summer may be alluded to—then the "cracks" may be resumed. A little rest is good. We do not suggest an abolition of the topic, not until not only every crack in every barn is stopped up, but not until every crack is anticipated and stopped up before it develops into a crack. "A stitch in time saves nine." If every farmer would "go over" his barn several times every season and nip every crack in the bud, blooming cracks would be unknown. This is the view we propose to take of it another year. It has never been touched upon in that way that we know of.

Literary Miscellany.

GROWN APART.

ONE in name, yet two in heart,
Slowly, but surely, grown apart;
Saddest of all sad sights to see—
Love from his own sweet bonds set free.

Grown apart—through the lagging years—
Nor smiles, nor sighs, nor melting tears
Shall call love's rose to the cheek again,
Or thrill the heart with its precious pain.

Growing apart—for evermore—
A canker worm at the very core,
Shorn of all the sweets of life;
An unloved husband, unloved wife,

Ah well! they have had their little day;
Some flowers bloom only, and die, in May;
And if these have missed the summer's prime,
And riper fruits of the autumn time—

Knowing only the drought of one,
And failing the other's blasts to shun:
There yet may be garnered in each sad heart
Sheaves that have ripened and grown apart.

ANCESTRAL HALL OF A CHINESE MANSION.

ALL the Chinese, whether Confucianists, Buddhists or Taoists, worship the spirits of their deceased parents and ancestors, and offer to them money, food and clothing. This is done before their tablets, which are placed in some recess in the house, or, in the case of the wealthy, in the ancestral hall, which is connected with the family mansion.

The general belief is that the unseen world is very much a copy of this, only that things are spiritualized. The departed spirits are supposed to need food, clothes and money, just as much as when they lived in bodies, and it is the duty of their living friends to provide them with these.

CORA.

CHAPTER VII.

"A WORD with you, signor," said a voice, which Lord Almane immediately discovered was Marianna's.

He shook her hand off a little impatiently.

"Well!" he said, haughtily. "What is it?"

"You will pardon me, signor," she went on, quietly, "if I seem to be taking a liberty; but the signorina's happiness is very dear to me."

"And to me, good mother," answered the Viscount, thinking it might be wiser to win the old woman to his interest.

Marianna's face brightened a little.

signor, if I understand aright what I heard——"

"How interrupted Lord Almane, sharply.—"Have you, then been eaves-dropping?"

"Wherefore not?" replied the old woman, with a sort of simple, unconscious dignity, which at any other time would have amused his lordship, "You are a grand seigneur, and I but an old nurse; but I love my signorina, and if any action of mine can save her from dishonor——"

"Who speaks of dishonor?" again interrupted Lord Almane. "You are doting, Marianna."

"From sorrow, I should have said, she resumed with the same calmness of manner, "Milord, you have won the child's love, and yet I heard you say to-night that you were bound to another."

The Viscount uttered an impatient exclamation; he did not at all approve of Marianna's cross-examination.

"If you are not going to make the signorina your wife," she went on again, heedless of his impatient gesture or quick stride, "why speak of love to her, milord?"

"My good woman," replied the Viscount, haughtily, "men in my position don't marry every pretty face they come across. The signorina and I understand each other perfectly. Do not trouble yourself to interfere any further."

"Signor," she said, passionately, "the child is well-born—as highly connected as yourself; she is fit to mate with the highest in the land."

Lord Almane laughed lightly.

"We will not discuss the point, my good woman," he said, carelessly. "There is no need for you to be kept from your rest any longer. If your pretty signorina is willing to let things be as they are, why need you trouble? I will take care that no harm happens to her, Marianna."

"You dare not harm her," the old woman exclaimed, fiercely. "You dare not harm her! Nay, had she not her brother to defend her, you should not do so—you dare not, I say!"

"Take care," he answered, in a menacing tone—"take care; your interference cannot do good, but it may do harm. I am not accustomed to be baulked in my wishes either by brother or duenna."

Marianna paused, and laid her hand on his arm, with a hard, stern pressure.

"Listen, signor," she said, in the cold measured tones of contempt; "you are great, and noble, and wealthy; I am but poor, humble, and ignorant, but from my soul I despise you. You come into a poor man's house, and receive hospitality and kindness, which you repay with baseness and ingratitude. You shall hear me; you shall know that a poor ignorant servant has only contempt in her heart for the grand seigneur who, in return for confidence and friendship, steals the richest treasure the man possesses, and blights the happiness of a fair young life."

Lord Almane uttered an execration, and tried to disengage himself, but this was impossible without using actual violence, and this he could not do.

"Loose me" he said, in a low tone, full of concentrated anger. "Loose me; you are mad."

"I would not wish the signorina to marry you now," she went on, without heeding his efforts or his angry exclamations, "if you were to sue her on your knees; I pray for a happier fate for her than that she may wed such as you."

She removed her hand from his arm, and allowed him to pass before her into the house; then she noiselessly closed and barred the door after them, and followed him up-stairs. As they passed the door of Cora's room a sound of stifled but passionate sobbing struck upon the ears of both. Lord Almane started and half paused, while, by the light of the candle she held, Marianna saw that he had turned a shade paler. Then he passed on quietly, and entered his own room, while the Italian waited until the sorrowful sound had died away, and she could hope that Cora slept, before she sought her own room.

The next day Lord Almane left The Tryst: his manner was graver and quieter than usual, while Cora's forced vivacity badly dissembled the heavy eyes and the pale cheeks which told of a sleepless night.

The Viscount returned to his chambers in the "Albany" with no small regret; but he threw himself into the vortex of the London season, which was early and brilliant that year, and strove to shut out the remembrance of those wistful haunting eyes, and of the sweet low voice which sounded so often in his ears. They came before him often, notwithstanding all his efforts. More than once, whether riding in the Row with Lady Helen St. Maur, the prettiest married coquette in his "world," or bending over the daintily-gloved hand when she stopped her victoria, and bent her graceful head in pleased greeting, there came before him another fair face which shut out all her ladyship's—a face with dark lustrous eyes, full of reproach and pain, and quivering crimson lips, and then he would be so absent and *distrait* that Lady Helen would toss her haughty head and wonder to herself.

"Are you thinking of Lady Lucie?" she said one night, as they sat together in the conservatory of a great house, where all the best, and noblest, and highest in the land were assembled to "chase the hours with flying feet," and Lord Almane and her ladyship were favorite guests. "For quite ten minutes you have said nothing, and I allow no one to be silent and absent in my society."

Lord Almane smiled as he turned to her, and his eyes fell upon the radiant beauty, with diamonds flashing on her white throat and wreathing the noble coronet of raven hair which crowned her fair brow. Truly she was beautiful, in the sheeny satin robes and flashing jewels; but beside that queenly radiant figure there appeared to him a slender girlish form in dark serge, with a crimson ribbon fastening back the rich brown hair, and Lady Helen's beauty seemed cold and conventional beside that girlish loveliness, so pure, and fresh, and glowing.

"Thinking of Lucie?" he repeated, giving to his languid tones an expression of eager dissent. "Do you think that is possible when I am with you? Why do you try to remind me that the day must come when——"

"When Lady Lucie Belmont becomes Viscountess Almane," she interrupted, lightly. "By my faith!" she added in a moment, laughing a little musical laugh, "Lucie Belmont is most confiding to remain in Italy so long, and leave her *fiance* to follow his own sweet will! I, in her place, would not be so much so."

"Would you not?" he answered, readily; "and yet there would be less fear."

And the beauty laughed her triumphant laugh, and flashed her dark eyes into his, as they sat in the scented, dimly-lighted conservatory, and played at the pretty game of Platonics, which might be safe to them, but which is so often attended with sorrowful results.

But even the pretty game of Platonics, with Lady Helen St. Maur for a partner, did not quite satisfy the Viscount now, and after he had left The Tryst three weeks, he resolved to pay a visit to Harold Sinclair.

"We parted good friends," thought his lordship, as he drove down in his mail phaeton. "The brother suspects nothing, unless that old Italian witch has betrayed us, which I doubt."

The road was looking its prettiest this fair spring day, and Lord Almane's spirits rose as he sped along; but as he drew near The Tryst he fancied it looked closed and uninhabited.

Pulling up at the little gate near which he had met with the accident a short time before, he threw the reins to his servant, and went himself to make inquiries.

The door was opened by a surly, untidy-looking woman, who immediately vouchsafed the information that the family were not there.

"Where have they gone?" said Lord Almane, in some surprise and discomforture.

"I don't know, I'm sure," returned the harpy, peering at him through the small space which she had opened the door.

"How long have they left?" resumed the Viscount, slipping half a crown into her hand, which *douceur* softened the rough tone.

"Quite ten days, your honor," she replied, with some civility. "I can't tell you much about 'em, but I did hear that the gentleman, who is a hartis, 'ad gone to study his hart in furrin parts."

The Viscount turned away with an angry scowl and muttered exclamation.

"The birds have flown."

CHAPTER VIII.

Lord Almane returned to town vexed and baffled: he had counted upon seeing Cora again, upon holding the little fluttering hand in his, upon seeing the sweet faint color deepen in the rounded cheek, of meeting the great, lustrous eyes half innocently, half bashfully lifted to his, and his disappointment was acute enough to make itself felt. But acute though it was, it was but momentary; and long before he had reached the Marble Arch, Lord Almane had remembered that it was quite possible to find out the whereabouts of most people; that there were such things and places as private inquiry offices, and that a golden key would unlock most hiding-places, even if Harold Sinclair had purposely removed his sister.

"Can he have taken her away to cut off any communication between us?" mused his lordship as he tooled his chestnuts through the park and acknowledged the greetings of his acquaintances. "Has that meddling old woman indeed betrayed us? I thought he half suspected something on my last evening, but his manner afterwards made me think otherwise. Ah! well, I am not so easily defeated, and Cora is worth some little trouble."

June came, bringing with it from the sunny south Lady Lucie Belmont and her aunt, Lady Martyn, and the Viscount, in duty bound, was one of the first and most constant visitors at their house in Park Lane. He was fond of his cousin in a quiet cousinly manner, but she bored him rather, and he would have infinitely preferred Lady St. Maur for a companion, not for life, perhaps, as the Viscountess Almane must be like Cæsar's wife, "above suspicion," but for a flirtation.

Lady Lucie was a pretty, fair creature, with large blue eyes and flaxen hair, a gentle manner, and a very sweet, low voice; but to Lord Almane, accustomed to the more brilliant charms of the great ladies of his world, impressed now with Cora Sinclair's glowing, soul-lit loveliness, his cousin was a little insipid; and though he was attentive enough to be styled a model lover, as I said, her attention bored and wearied him.

"You are not looking well, Stanley," said Lady Lucie, on the evening they met. "Are you sure you have quite recovered from the effects of your accident?"

And the wistful blue eyes turned to him with a tender earnestness in their depths.

"Quite, dear," he answered, smiling at her, "I suppose, however, two or three weeks of suffering leave a mark behind them even when they have entirely passed away."

"Tell me about the people at Richmond, with whom you were," she went on. "I mean the young artist you wrote to me of. They were kind to you, you said."

"Very," answered the Viscount. "It was a quaint, old-fashioned cottage, with gables and lattices which would have delighted a romantic young maiden like yourself. The household consisted of an old Italian woman, who wore the dress of her country, and might have stepped out of a Rembrandt, and one English servant. Harold Sinclair himself was very unusually handsome, and I fancy talented in his profession; while his sister, though quite in a different style, was equally good-looking."

"Will you take me to see them?" asked Lady Lucie. "I should so much like to thank them for their goodness to you, Stanley."

"Grateful little heart," he replied, smiling. "That is a graceful proof of your interest in me, dear Lucie; but I am very sorry to say that when I called at the Tryst a short time after I had left it, I found it closed, and the person in charge could only tell me that they were gone abroad."

"I am sorry," answered Lady Lucie, sincerely. "We might have been useful to them perhaps, Stanley."

Days slipped rapidly by, and the London season was drawing to a close; but Lord Almane had had no satisfactory result as to his inquiries about the movements of Harold Sinclair, and he began to be getting rather anxious about his success in the matter. The obstacles which separated him from Cora by no means quenched his desire to see her—on the contrary, they rather increased his ardor and added zest to his pursuit. He was more than ever determined to find her again, and to regain the power he possessed over her, and which, if absence had weakened it, would be easily regained.

Meanwhile, he rode and drove with Lady Lucie, attended her to the few evening entertainments her health, which was delicate, permitted her to enjoy, appeared regularly in Lady Martyn's opera box, and was altogether devoted enough to raise a smile among some of his intimates, who opined that Almane was becoming sober at last.

Lady Lucie was supremely happy, and her happiness transformed her from a pretty girl, wanting life and color, into a lovely and interesting woman. Her eyes grew lustrous and brilliant, her lips were wreathed with bright smiles, and a charming rose-bloom replaced the pallor of her cheeks. People began to remark that the heiress was turning out a beauty as well, and that the Viscount was a lucky fellow to obtain beauty, wealth and amiability in his wife.

"Will you take me to see Mrs. Colston to-day?" said Lady Lucie one afternoon, when Lord Almane settled her comfortably in his phaeton, and prepared for one of the cosy *tete-a-tete* drives,

ANCESTRAL HALL OF A CHINESE MANSION.

which were few and far between, to suit Lady Martyn's old-world notions of propriety.

"If you like; but it is almost a pity to waste such an afternoon upon her, Lucie."

"It will not be wasted, Stanley," she replied, laughingly. "Nowhere shall we receive such a hearty welcome, and the honor of receiving you will drive her wild with delight. Do come."

"Your wishes are laws," he replied, gaily. "Let us have one turn in the park first, and then for Brixton, *Lucia mia*."

So they drove gaily away through the thronging carriages and rank and fashion of St. James's; and then he turned the horses' heads towards Brixton, where Mrs. Colston, who was the wife of a rich merchant and Lady Lucie's former governess, lived in a handsome modern mansion.

"Poor Mrs. Colston!" said the Viscount, as they went slowly up the carriage drive. "It always surprises me that with so much money she has so little taste. She has not a single beautiful thing in her house."

"Oh, Stanley, you are wrong," exclaimed his *fiancee*, excitedly. "Look up there. Is not that a lovely face?"

Lord Almane glanced up in the direction she indicated, and saw what changed his indifferent expression into one of eager and intense surprise. It was the face of a young girl, who was sitting by the open window, apparently absorbed in a book she held. Her eyelids were lowered and hid her eyes, but the exquisite shape of the face, the careless grace with which her rich luxuriant hair was drawn back from her brow, denied Lord Almane's assertion that Mrs. Colston had no beautiful thing in her house.

"Who can she be?" mused Lady Lucie; and though Lord Almane could have gratified her curiosity, he did not pause to do so.

Reining in his horses with a sudden jerk which pulled them almost on to their haunches, he threw the reins to the groom, and springing out, lifted out Lady Lucie, who ran lightly up the steps to meet Mrs. Colston, who appeared full of hospitable but fussy welcome.

The Viscount waited a moment to give an order to the servant, and then followed more slowly; as he did so the girl in the window lifted her eyes, and they met his. It was but a transient glance, but it sufficed; Lord Almane saw the beautiful face flush and grow pale, and knew that he had found again the girl for whom he had made such fruitless search. The face at the window belonged to Cora Sinclair.

As Lady Lucie had predicted, the welcome they received from Mrs. Colston was of the heartiest; she was delighted to see her ex-pupil looking so bloomlng, and overwhelmed with the honor of Lord Almane's visit, while the latter charmed her by the cordiality and easy grace of his manner, and for some minutes the drawing-room, gorgeous in gilding and crimson damask, was alive with lively and animated conversation.—To be continued.

AUNT CALISTA'S HAIR.

"Splendid!"
"Magnificent!"
"So long!"
"So thick!"
"And soft!"
"And glossy!"
"The loveliest brown!"
"With just a tinge of gold!"
"And it waves so sweetly!"

It was Edna and Alice Bristol who were praising their Aunt Calista's hair. Aunt Calista "pished!" and "pshawed!" and begged them to hush; but it was evident, after all that she was pleased at their enthusiastic praise of what was her only positive attraction. An attraction, of which she, poor soul, had been heretofore but dimly conscious, for all her life, thus far, had been so occupied in caring for others, that she had no time to think of herself, whether she were a fright or otherwise; though a fright she certainly was not, for her complexion was fair and clear, and her expression was one of great sweetness and intelligence, too, so what matter if her features were not all cast in beauty's perfect mold.

A quiet, sober, and, at times, a sorrowful existence had been hers since her earliest girlhood—she was now bordering upon old-maidenhood—when, for several years, she was almost the sole nurse and companion of an invalid mother; and then, later, when death had removed from her clinging arms this loved charge, her father was stricken down with an incurable and lingering disease, and she was kept a close but not unwilling prisoner by his side for many more long, weary years, until now he, too, was mercifully taken to rest, and she had come to make her home, for awhile, with an only sister, who had married and removed far from her native place, many years before.

This sister and her two young daughters were gay and fashionable, and it seemed like being in a new world to her, quiet old maid as she was, and she kept within the seclusion of her own room as much as her lively nieces would allow her.

Do not imagine, though, that she was either awkward or vulgar, for she was nothing of the kind. Her father had been a man of high mental culture and refinement, and the few friends who visited him occasionally during his long illness were gentlemen of like tastes and advantages; besides, too, she, with him, had been a constant reader of all the standard literature, as fast as it came before the public; so that, although dreading society, and shrinking and easily embarrassed when compelled to mingle in it, she was far from being a person of whom her friends need feel ashamed, had they been much more sensitive than they were.

"Oh! Aunt Cally," pleaded Edna, "do let us dress your hair, just this once. You've no idea what a difference it will make in your appearance to have it done fashionably. You might be stylish if you only would. Why, your hair alone is enough to make your fortune!"

"Make my fortune?" said Aunt Cally. "I don't understand. Sell it, you mean?"

"Catch a husband with it, I mean," laughed Edna. "Now, don't look so horrified, aunty! You must know that every girl and woman wants to do that—catch a husband—whether they will own it or not."

Aunt Calista *was* horrified, quite as much as her looks expressed.

"Catch a husband!" she gasped. "Girls of your age talking like that! Why, I thought it was women who were caught if there was any catching in the case. I didn't know that they hunted or fished for husbands!"

"Well they *do*, Aunt Cally," asserted Alice, she, as well as Edna, intensely amused at their aunt's "country simplicity," as they called it. "Why, half the women here are doing their very best to catch Lawyer Chester now."

"The bold, forward things!" exclaimed Aunt Calista, in great disgust. "If he has any sense, he won't have any of them. I hope neither of you are included in the number."

Alice tossed her head with a little sniff, saying: "I don't care for a husband old enough to be my father, if he is rich and popular; and as for Edna,"—with an arch look towards her sister—"she has her fish already caught; so don't worry about us, but just be nice, and let us braid these beautiful long tresses, and put them up high upon your head in a lovely coil, and then you'll look young and pretty; and you shall catch Lawyer Chester yourself, so you shall, without trying one bit."

"You make me ashamed, though I know you are only teasing. If I thought you were in earnest I should be angry with you," replied Aunt Cally.

But the girls had their way with her hair, though they nearly had their labor for their pains; for when she escaped from them at last, and took a look at herself in the glass, she gave a half-frightened exclamation of, "Oh, my patience!" and unconsciously put up her hands to destroy the wonderful structure they had built of it. They both flew to the rescue, laughing, and seizing her hands.

"Don't, don't, aunty!" they both entreated; and Edna added: "You look splendid; and you'll get used to it in a little while; so, now, please, put on your most becoming dress, and then if company calls, you must not run off and hide yourself as soon as the bell rings. You look ever so much like mamma now, only younger, and she's not thought to be a bad-looking woman I assure you."

Two hours later, Aunt Calista came stealthily down stairs with a volume of Bryant's poems in her hand, and her black straw hat "upon her face." She said: "There was no other way to wear it." She was going for a walk, mainly to escape the company which she was certain was expected during the afternoon.

"Wait a moment, aunty," called out Alice, who provokingly came through the hall, just as she thought she had escaped the observation of any of the family. "Wait a moment, and let me bunch up your overskirt a little more. You are determined to ruin all your prospects in life, and disappoint the cherished hopes of your dearest friends."

Aunt Cally laughingly eluded her, and darting through the door, disappeared around the house, and took her way across the garden and through the meadow to the brook, which skirted its farther edge. She strolled along its bank until it entered a wood, and then for some distance farther, enjoying the coolness, the silence and the restful quiet.

"Oh, this is lovely!" she said to herself. "And there is just the place I have been looking for! That spreading beech upon that bank. I wish that clump of alders was not there, though; they hide the brook from me; but never mind, I can hear it ripple, and gurgle, and 'babble,' I believe the poets call it, and that will do quite as well as seeing it."

So she climbed the steep bank, and seated herself with her back against the smooth stem of the beech, and, removing her hat, looked about her for a few minutes, and then with a sigh of satisfaction opened her book and read:

"Here are seen
No traces of man's pomp or pride; no silks
Rustle, no jewels shine, no envious eyes
Encounter; no fantastic carvings show
The boast of our vain race, to change the form
Of thy fair works. But thou art here; thou fill'st
The solitude."

Hark! Was not that footsteps? It certainly was; and they were coming down to the brook. Now she was glad of the alder screen. She would remain quite still, and the person, whoever it might be, would pass on, unconscious of her presence.

There he came; she could peep through the bushes and see that it was a man; yes, a man with a fishing-rod—a short, middle-aged man—"And, of all things! if he isn't going to stop right here! Well, this is a situation! I can't go away. He'd be sure to see me. I shall have to sit still and hold my breath. What if he stays here all the afternoon! I hope to goodness he won't catch a single fish, the brute! I won't look at him!" for she had been peeping down through the branches of the alders, while the gentleman was rapidly preparing for his cruel sport.

It was rather an embarrassing situation for a timid spinster, to be sure. The gentleman was so close to her that, but for the screen of alders, she could almost have touched his hat with her hand. The alder-bushes were barely high enough to hide her from view, as she sat. The moment she arose she might be discovered. Besides the unpleasantness of the situation, she had a profound horror of fishing.

"I won't look! I *won't* look!" she said to herself, over and over, and resolutely bent her eyes upon her book. But try as she might, she could not take the sense of what she read, and could not keep her eyes from stealing glances now and then through the leaves, down at the unconscious figure, sitting so motionless almost at her feet. How absorbed he was! She could not see his face, of course, for his back was towards her; but she fancied that his eyes were bent immovably upon his line, watching for the least intimation of a bite or a nibble.

Before she was aware she, too, began to be interested. Luckily, or unluckily, she could see a bit of the line, just where it entered the water. There! did it not tremble a little? No, it was only a ripple in the water that moved it. There, again! That certainly was something. Oh, dear! it was too dreadful! What if some poor little hungry, unsuspecting fish were to come along, and be caught on that cruel hook, deceived by the tempting bait, and she should be obliged to witness the barbarous transaction? She *would not* look another second. But, somehow, she couldn't stop looking, and every minute vibration of the line only increased the fascination, and made her the more anxious for the result. Once or twice the hook was lifted out of the water for an instant, and each time she almost shrieked aloud.

"If he should bring up a poor little struggling creature, I shall scream, I know I shall," she said to herself. "It seems as if I must throw something at him, the great awful brute!"

She had half risen now, and was peering over the tops of the alders with anxious frightened eyes riveted upon the line, feeling, as she had just said, as though she must scream, when, all at once, there was a very perceptible pull downward, followed instantly by a most vigorous jerk upwards, and she did scream, for good gracious! what was it tugging at her hair, as though the purpose was to take it all out by the roots?

Her scream brought the gentleman to her side almost instantly.

"Good Heavens, madam!" he exclaimed, excitedly, "I hope you are not hurt. What is it? Ah! I see; my fish-hook caught in your hair. How awkward of me! However, be calm, madam,"—this, by the way, was wholly unnecessary, for Aunt Calista was as quiet and composed, to all outward appearance, now as she ever was in her life—"I can very soon extricate it, if you will allow me." And without waiting for permission with deft pliant fingers, he set about his task, talking volubly all the while; now a word or two of apology for himself, then a remark upon the beauty of the day, then her book—Bryant was a favorite of his, too—then a compliment to her hair—he wouldn't have believed it was natural—until, at last, in a tone of satisfaction, and with a little flourish of the hands, "There we are," he said, "clear at last!" And Aunt Calista thanked him, without exactly knowing for what, however; and taking her book and hat, prepared to return home.

Half an hour later, her sister and nieces were electrified by seeing her walk shyly into the house, accompanied by Lawyer Chester, for it was he, and this is the way their acquaintance began. How it grew and ripened I shall leave you to guess from this slight bit of conversation which somebody overheard the following Christmas:

"It was your hair that did it, after all, Aunt Cally,"—it was Edna who was speaking—"and what did I tell you? Didn't I say that, properly managed, your hair might make your fortune? And hasn't it? You've got a husband, or will have one to-morrow."

"But please to remember, miss," Aunt Calista replied, with spirit, "that *I* was the one that was caught."

KEW GARDENS.

WILLIAM FALCONER.

The Royal Botanic Gardens, at Kew near London, are the noblest national botanic gardens in the world, and there more living genera and species of the vegetable kingdom are represented than in the same space anywhere else on the earth. They comprise an area of 322.8 acres, and are supported by the British Government at an expense of about $100,000 annually. They come under the jurisdiction of the Board of Works and are presided over by a director (Sir Joseph Dalton Hooker, who visited our country for nearly three months last year), an assistant director and a curator; and have a working force of several permanent and experienced foremen, some thirty experienced young gardeners who are employed in the greenhouses, and a host of outdoor and indoor laborers.

Visitors are admitted gratis from 1 P. M. till dark everyday of the year, Sundays included, except Christmas day on which day the gardens are closed. The proximity of Kew to London, the fame and beauty of the gardens, the lovely flowers, and the acres of glasshouses and ample breadths of lawns and woodland groves make these gardens a pleasurable resort in summer and winter, in fair weather or in foul, and they are well patronized by visitors of whom on holidays from 20,000 to 60,000 visit them.

The outdoor gardens are divided into two divisions, which are known as the Botanic Gardon and the Arboretum or Pleasure Grounds. The grounds in the botanic garden are kept as well as those of any nobleman in the country, and are enlivened with beds of spring and summer-blooming plants, groups of shrubs, noble specimen trees from all parts of the temperate world, alpine plants and ferns, and a special corner for hardy herbaceous plants, of which the collection represented is enormous. The Pleasure Grounds include a piece of woodland, a wide sweep of lawn, hills and dells, also a lake. And in this division hardy shrubs are arranged in botanical groups, and among them are very many representatives of the United States. Unfortunately, the natural soil of Kew Gardens is wretchedly sterile, and consequently arboreal specimens are short-lived; but as regards shrubs and particular trees, the evil is partly remedied by introducing a depth of good compost where only a parched skin existed. The beauty of these gardens is enhanced by the presence of Father Thames which skirts their whole length on one side, the princely mansion and spacious grounds of Syon House, the Seat of the Duke of Northumberland, and which is on the opposite side of the Thames, and the proximity of Richmond, from the hill of which one of the most lovely views in Southern England is obtained. [In the grounds at Syon House is the finest collection of mature specimens of American trees to be found in Great Britain.]

The green-houses at these noble gardens are numerous and immense. The Palm house is a magnificent curvilinear glass building, iron being used altogether in place of wood. Its outline is a semi-ellipse; the extreme length, 362 ft.; breadth of center, 100 ft.; and hight of central part, 63 ft. It is surrounded within by side benches, on which plants in pots are grown and geographically arranged, and the central spaces are occupied by large plants of every tropical country, grown in large pots, immense tubs, or planted out in beds of earth. We commonly regard palms as graceful little pot-plants, such as are seen in florists' shops; but to see them as they are at Kew, we must recall the towering tufted trees that kiss the waters of Florida or the West Indies, or are found in gardens along some parts of the gulf coast. In this glass house we find fan palms and feather palms with leaves rising right to the topmost pane, fan palms, date palms, sugar palms, and others with vast arboreal stems annually flowering and fruiting. A fan of Sabal umbraculifera might roof a cabin, and feathers of avenga saccharifera are over 30 feet long. The Giant Bamboo shoots up branched stems of over 50 ft. high in a year, and the Traveller's Tree of Madagascar is seen in its true character, with tall palm-like trunk and tufted head of erect banana-tree-like leaves. Arads and jungle vegetation and twiners court the stems of the palms, and the walks are bordered with a dense edging of living moss. "Jack apples" of Java ripen as plentifully on the tree as Baldwins do in New York, and the clusters of Bananas (M. sapientum) are yearly matured, and they are of splendid quality. Round the central portion of this structure is a gallery (after the fashion of that at the botanic garden at Washington, the palm-house at which is to that at Kew but little more than a marble is to a foot-ball) reached by two cylindrical iron stair-cases, and from which the beauty of the tropical forests beneath can be viewed to advantage.

The Great Temperate House is larger than the palm house, and with the exception of the two end wings is completed. As it now stands it presents a central part 212 feet long, 137 feet wide and 60 feet high, and at each end is an octagon 50 feet in diameter. The end wings are proposed to be 112 feet long, 62 feet wide and 37 feet high; so that when finished this house will be 582 feet long, covering some 48,000 superficial feet—nearly 1⅓ acres. Here are collected all half-hardy plants, from Australia, New Zealand, the mountains of India, some parts of China and Japan, the Mediterranean neighborhood and elsewhere, and nowhere in England is there a more pleasurable result than is here attained where the plants are planted out. Araucarias, Blue Gums and some others soared so lofty that they had to be removed; the Sikkim Rhododendrons are at home and a-blaze; the Australian Acacias are mighty trees, umbrageous, silvery, graceful and draped with gold; and Evergreens assume an almost olive hue. Eugenia Ugni berries as heavily as do Huckleberries in New England swamps, and Passion flowers depend in festooned drapery on staircases and from the roofs. Benches with geographically arranged plants in pots surround the house, and a stairway conducts us to a gallery above.

In the Water-Lily House the Nelumbium or Sacred Bean of Egypt and tropical Nymphæas grow with native luxuriance. In another aquarium the Victoria regia is regularly grown to perfection. Its circular leaves attain nearly seven feet in width, are strongly netted underneath, and, providing a tray or board be placed on them to prevent breaking through them, they will bear up over a man's weight without breaking or sinking. From twenty to thirty-four flowers are annually produced; they are large, beautiful, of a pale rose color, and last but a day.

Next door is the Orchid department, where India's most gorgeous treasures, and the most beautiful gems of the Andes and Mexico find a home; and the representatives are legion. Pitcher plants too, from the Indian Archipelago, find a resting place. At the opposite end are economic plant houses, where the representatives of tropical and semi-tropical plants of medicinal and other commercial interest are grown. An adjoin-

ing compartment is devoted to beautiful Stove plants, and next to that another where the multitudinous representatives of the Begonia family are displayed. The next house contains South Africans in the way of Mesembryanthemums, beautiful Cape Heaths, Pelargoniums, etc.

Then there are ranges of ferneries where every tropical and subtropical representative of the genus obtainable is grown, and that creditably too; and the collection is immense. Besides these is No.4, or the greenhouse, which is kept as a show-house, and in as gaudy dress as I ever saw greenhouse anywhere; in fact, I never saw a conservatory where so many genera and species of really beautifully flowering plants were in bloom at one time; and here florists' and horticultural varieties are as rife as species.

Then there is the Cactus house where benches and beds are heaped with the oddities, with their woolly pates, formidable spines, and brilliant blossoms. Candelabrum Euphorbias, massive Agaves and hosts of other monster and tiny succulents are here congregated, as well as tall-stemmed grass trees from Australia. On the whole, I don't know of a collection in the world approaching this one in completeness, notwithstanding often published assertions to the contrary.

Near the main entrance gate is a large dead-like glasshouse—an old orangery I believe, which is now chiefly devoted to Araceous plants. Here Anthuriums, Marantas and Philodendrons of undreamt of forms exist, and the Mexican Monstera deliciosa climbs up a back wall for twenty feet to ripen its cone-like fruits, which when ripe are truly delicious. In this house tree ferns display their far-reaching fronds, and that handsome shrub-tree, Brownea coccinea, unfolds its colored young leaves and its showy blossoms. But one of the most wonderful plants in the house is the Lace or Lattice plant, a pretty little acquatic from Madagascar. Its leaves are from 9 to 16 inches or so in length, 1 to 3 inches broad, and just like skeletons, being as systematically netted as a honeycomb is celled.

Besides these greenhouses there is quite a village of glasshouses for propagation purposes and growing plants for conservatory and outdoor embellishment, but they are private. There are also glasshouses and nursery grounds connected with the Arboretum.

In addition to these features there are three separate museums—big buildings, situated in the gardens, and which contain vegetable products crude and manufactured of every conceivable kind, also specimens of woods, models of flowers, fruits, and hosts of other things.

Apart from all these and outside the garden proper are the herbaria and libraries and a staff of eminent botanists of whom the nineteenth century has cause to be proud.

The object of these gardens is to combine science with recreation and to collect and disseminate the plants of all quarters of the globe. Kew gardens are one of the sights of London, but even an uninitiated person can no more see them all through them in an afternoon, than he could our late Centennial Exhibition in a day. The liberality with which plants and seeds are distributed and exchanged at home and abroad, and the facilities for examining the living and dried specimens, together with the courtesy and attention shown by the officials at Kew to Englishmen and foreigners alike, are worthy of such noble gardens, which are not only of national but of international importance.

Botanic Gardens, Cambridge, Mass.

THE BRONCHO PONIES.

QUITE the most remarkable trained horses are now performing in this city, at the Aquarium. Trained hardly conveys a correct appreciation of the developed intelligence of these animals. From a wild state, these Mexican ponies have been taught to perform most intricate evolutions by mere word of command; to carry handkerchiefs to boxes, put them in, shut down the lid, and then to reverse the operation; to "see-saw," a horse being at either end of a long plank, the performance showing a perfect discernment of equilibrium. To roll a cylinder up an inclined plane, and down the opposite side, pushing and holding back with the fore feet, is a tremendous strain on an animal, and has never before been accomplished by a horse. This in conjunction with the remarkable jumping feats of the horse Nettie, is alone worth the going far to see. An amusing incident of the performance is the exact imitation of circus performers by a dog and two goats. They ride fearlessly; jump over hurdles, through hoops, and in short, so closely and excellently imitate those biped rivals, that it is quite enough to put a "star" out of conceit with his his profession. The courtesy of the attendants at the Aquarium makes it a charming place of amusement for ladies and children unescorted. In fact nothing mars the merriest of the performances.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

HER LETTER.

THE following lines were suggested by a letter found by the writer upon the beach near the scene of the wreck of the Huron:

We walked at night the wreck-strewn sand,
We walked and watched the dying storm;
With eager eye and ready hand
We sought to find some sea-tossed form.

And as we walked the guard and I,
The tide crept out till broad and gray
The shingled sand shone smooth and dry,
Beneath our fitful lantern's ray.

On either side, and everywhere,
Lay limb and broken bits of wreck,
Of clothing, ropes, of wooden-ware—
All kinds of things one finds on deck.

From out this scattered wreckage waste
I stooped and picked a little note,
A dainty monogram was traced
Above the lines the owner wrote.

"My darling"; but it gave no name,
As if he only of mankind
To such sweet title had a claim:
The words were coined her love to bind.

'Twas written full, and crossed again,
All interlined with after thought;
'Twas spotted o'er with salter stain
Than e'en the sea could yet have wrought.

"My darling"; there a fold was pressed,
The words just here were fainter yet,
As though 'twere worn upon his breast,
A prized and sacred amulet.

Anon, she wrote her hopes and fears,
Of fickle fortune's smile or frown,
Of homelike joys in coming years,
When they were wed and "settled down."

She spoke of spring and Easter flowers,
Of silk and satin for her bonnet,
Of sick friends, funerals, marriage dowers,
Her new suit and the trimmings on it.

And so this unknown maiden wrote
Her loving letter to the end,
And little dreamed the waves would float
Her writing to a stranger's hand.

Somewhere, to-night, a girlish face
Is raised to God in mute despair;
Somewhere, a woman prays for grace
And strength of soul her load to bear.

Somewhere along the wintry coast
Her hopes lie buried in the sand,
While this tells of the love that's lost—
This sea-stained letter in my hand.

[*N. Y. Graphic.*

TALKS ON TIMELY TOPICS.

Decorative Pottery.

ROSE GERANIUM.

IF you admire the ugly work—and certainly you *must* so long as it is fashionable—I will tell you how to increase your stock at comparatively little expense. Of course I now refer to the popular Japanese style of adornment.

Procure a quantity of the little embossed chromo pictures which you see advertised in all the newspapers at from ten to fifty cents per hundred.

Select a smooth, angular-looking jar or flower-pot—the clumsiest of your lot. If it is clay-red, leave it so, and around the bottom and top either paint broad, dull blue bands or simulate them with strips of paper neatly pasted on.

From your collection of pictures choose a set as unharmonious and ill-adapted as possible—snakes saints, butterflies, zebras, tulips and so on, *ad infinitum*. Stick them fast in a blown-about fashion. Only one rule, here, must guide you and that is no rule at all.

If you do not care to purchase the chromos, sharpen your scissors and go on an expedition through a heap of old newspapers. You will be sure to find more than you can appropriate. Cut very carefully and by no means deprive your Madonna of her nose or your cow of her cherished horn. Bring with you a few redeeming sprays, leaves and buds. Now stain or paint them all black and you have your own domestic brand of material.

When the vase is complete, remember that there are cases when "distance lends enchantment to the view" and this may not be an exceptional one. Locate it at a respectful reach from the self-elected examining committee, dose your consciences with a mild extract of valerian and you can walk off and invest your ten or twelve dollars at the book-store! Your pottery will last until you grow tired of it and that is long enough!

Confidentially, I will whisper that spatter-work will help you to make your jar infinitely prettier. There is something really beautiful about a daintily spattered, red flower vase. It would scarcely be necessary to pen any directions, since, thanks to the blessed, home-missionary work of the newspapers, the act is no longer a secret to any who will care to practice it.

However, it may not be known to all how effectually and speedily the work may be accomplished by the use of an "atomizer." One can be obtained at any well-furnished drug-store. After it has once been used, the agent for "A full set of Spattering Tools" will be driven to new territory.

After you have experimented with fern and grass patterns, I will beg that you test the beauty of ivy leaves and berries. They are among my favorites.

A smooth, clear, glass vase or goblet is somewhat out of the beaten path for spatterers. After it is done, either line with white or fill it with flour. Behold the result of your labors!

Apropos, I remember the little japanned tin boxes, trays and canisters, so long condemned to secluded service in pantries, closets and kitchen cupboards. Here are treasures in earnest! Go, bring them forth, brush away all traces of dust and elevate them to their proper sphere. Pepper them over with star-spangled chromos or with wreaths and sprays of varnished autumn leaves. After this is done, you will have nothing left to desire and, like a certain monarch, you will be free to sit down and weep because you have no more *japanesery* to conquer!

DESCRIPTION OF CUTS.

NOS. 1 AND 2—WORK-BASKET, WITH EMBROIDERED DRAPE.

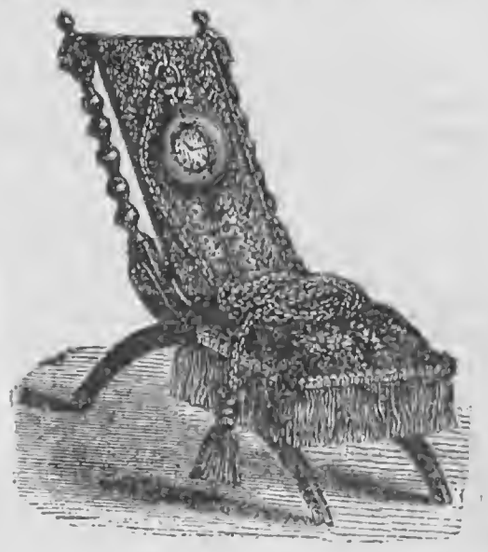
THE basket is of fancy wicker. It is lined with crimson satin or merino, and ornamented with a fine black cloth drape, embroidered in chain and satin stitches with crimson and gold-colored purse silk. A portion of the drape is shown in full-size in No. 2; it is scalloped and plaited at the edges. Two silk cords, one of crimson and the other gold-color, are neatly sewn round the top; the handle is ornamented with a crimson cord and tassels.

NO. 3—WATCH-STAND.

The stand is made of a small chair, which may be purchased at almost any toy-shop. It is ornamented with a stripe of embroidery, worked on black cashmere with gold thread and blue silk, which extends over the seat and back. The seat is finished by a fringe of blue silk, with a heading of gold, using a mesh measuring a quarter instead of a half an inch in width. A brass hook is sewn to the top of the back, from which to hang the watch.

NO. 4.—WALL-POCKET.

For the foundation take two pieces of stiff cardboard, measuring 14 inches long and 10 inches wide, and cover them with maroon cashmere, that used to cover the front being embroidered with maroon and pale blue silk. For the sides take double cashmere 4 inches wide at the top and 15 inches deep gradually sloped to one end. Sew these to the front and back, and sew up the bottom of the pocket. A fringe for the bottom



No. 3.

should be made of maroon and blue silk. The pocket is ornamented with bows of maroon and pale blue ribbon.

ITEMS FOR CORRESPONDENTS.

WATERPROOFS.—The old-fashioned circular style is still worn, but many ladies prefer the Ulster, it being more shapely. We have pattern (6151) of Ulster with triple cape. Four yards of goods forty-eight inches wide will be required. Trimmings—Ribbon, velvet is not used for trimming. Fringes made of silk, chenille, and worsted and shirrings and folds of silk or satin and lace are fashionable trimmings.

If the lady who asks what style of polonaise is suitable for a gingham, will send me her address I will mail her illustrations of several different styles.

HOW TO WASH TASSELS TO NUBIAS.—If any of your readers have tassels which have been soiled they can be washed so as to look as well as new, by braiding each tassel carefully in two or three braids, which prevents them from becoming tangled, and after drying they can be combed out, when they will look as well as if they had never been worn. MISS M. J. B.

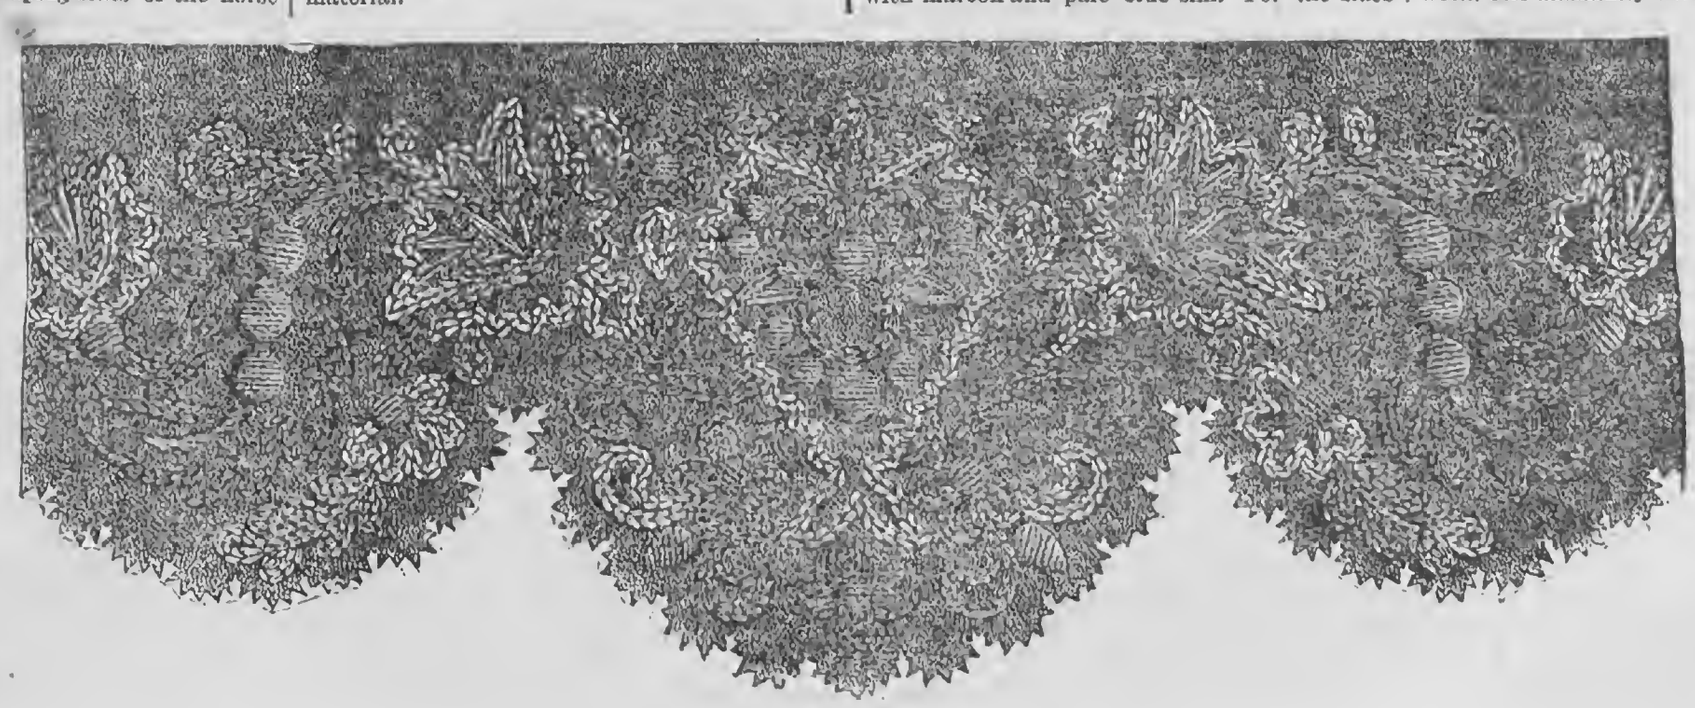
MRS. M. G. B.—Black silk jsacques will be worn during the coming season trimmed with lace or fringe. It is a little early to determine the most popular shape. For spring, English walking jackets and cutaways made in light cloths will be worn, but these jaunty shapes are hardly suitable for rich silk.

No. 4.

INDIA SHAWLS.—Real India camels' hair shawls, $45 to $85. India Deca shawls $10 and upward. Striped India in new designs and colors $12.

LILLIE WHITING.—The "Cricket" clock will make a suitable gift for your friend. It is infinitely preferable to the slippers you propose to work. The unanimity with which young ladies inflict slippers on their friends of the male persuasion has passed into a by-word, and is the occasion for no end of fun at their expense. Better send in the two names you have secured and order the "Cricket."

POTTERY AND LACQUER WARE — For superior work in decorating pottery, the Albert ware is the only ware I can recommend, but for decalcomania ornamentation, common pottery makes a very acceptable background—to those desiring it I will send by mail the address of reliable N.Y. firms who sell earthenware at low rates.



NUMBER 2.

The Querist.

ANSWERS TO CORRESPONDENTS.

Grafting Wax—Tree Wash.

T. Ham, Brantford, Ont.—As we are subscribers of the RURAL you will oblige us by giving (1) the best recipe for making grafting-wax also (2) for a solution for washing trees.

ANS.—(1) Use two pounds of resin, one pound of beeswax and a pint of raw linseed oil. A good way is to tear strips of calico, saturate them in the above composition when warm, and bind about the graft. Or the composition may be used alone.

(2) Dissolve one pound of potash in one gallon of water. Soft soap is good, especially for old bark. A quart of quick-lime may be thrown into two gallons of water, to which add a little lamp-black or mineral paint, so as to imitate the color of the bark. Tobacco ashes, a small quantity of carbolic acid may also be added.

Miscellaneous.

A. C. W.—(1) Are artichokes once established, troublesome to get rid of. (2) I have in my yard what was purchased for a Red Siberian Crab; it is from a questionable source, and bears small, yellow fruit of no account. It has been set five years, is fifteen feet high, and continues to grow two to three feet per annum. It is in a deep remarkably rich soil; fruit is the size of a hickory-nut. What is it? What is the trouble and the remedy? (3) Using it for a stock only, which would succeed best, budded or grafted on it; Pear, Apple or genuine Crab, or would either? (4) Would Huckleberry thrive at all with us in Illinois? I could give them high white-oak soil, or low bottom land, if our climate is not uncongenial for them. Would be satisfied even with a "poor do." if it would be likely I could get any berries at all.

ANS.—(1) They are. (2) The Red Siberian Crab apple is twice the size you state which is about that of the common Siberian Crab. (3) Any variety of Apple would succeed grafted upon it. The Pear would not. Pear stocks or, for dwarfing, Quince stocks, are alone used for the Pear. The Thorn and Mountain Ash are used as stocks for the Pear for special purposes. (4) We have often advocated the cultivation of the Huckleberry. We hope you will try, and let us know the result. Your other questions will be answered next week.

Mrs. F. M. Beers, Linn Co., Mo.—I can hardly find words to express my thanks for those flower seeds. (1.) How can you afford to be so good! (2.) Will you please describe the Eryngium Leavenworthii? I do not find it in my catalogues. Is it an annual? Is it hardy? Tell the *seedsmen* your kindness to us helps their business, for we are like *misers*. "The more we *have*, the more we want," and many a dollar will find its way to *them*, from those who never would have thought of cultivating flowers, had it not been for you.

ANS.—The kind feelings such as those you express, are a sufficient compensation. If we were obliged to buy the seeds we could *not* afford it. (1) We raise the plants, which we should do in any case, and collect the seeds. The cost to us is the time and trouble of collecting, the purchase of the envelops and addressing and stamping them. (2.) It is an annual of very easy cultivation. The leaves are of a metallic purple. The stems are two or three feet high and branching. When cut after maturity, they will last for a long time.

J. H. Clapham, Loudoun Co., Va.—I inclose some seed found in a lot of Ohio Sapling Clover seed. If the RURAL can tell me what kind of seed they are, it will very much oblige me, for I could not sow the seed on any account, as my farm is now quite clear of troublesome weeds; and for aught I know, these may propagate them.

ANS.—The seeds in the clover are those of the chess, such as is common in some wheat fields. In the sample sent all but one kernel were stripped of the hull which usually adheres to the chess. This was done, we presume, by the machine which hulled the clover seed.

L. H. D., Leon Springs, Dexar Co., Texas.—In the RURAL of January 12th, 1878, page 23, you recommend a work on "Swine Husbandry," by F. D. COBURN, of Kansas. I cannot get the work here, and my letter to Mr. COBURN was returned by the P. O. Department for more explicit directions. Can you inform a constant reader of your paper—either as to his further address, or how to get his work?

ANS.—The ORANGE JUDD Co., 245 Broadway, N. Y., will supply the work.

A. B. WARE, Oswego Co., N. Y. ANS.—We are unable to give you the law respecting the sale of leaf tobacco.

A Working Farmer, Rockingham, Va.—I would like to ask the RURAL one or two questions. I owe $2,000 on 90 acres of land, have six years to pay it in: 1st, will it pay me to buy lime at 12½ cents per bushel, and haul it three miles to put on my land? The soil is a mixture of gravel and sand with a clay bottom. Or will it pay to use lime at all? 2d. Will it pay to harrow wheat in the spring at the time of sowing grass seed? I want to get out of debt as quickly as possible.

1st. The soil may be deficient in lime in which case it may pay to use it even on gravel. Usually lime is chiefly beneficial in decomposing more rapidly the vegetable matter the soil contains. Probably your soil has no large amount of vegetable matter and this use of lime would not be advisable. For the direct use of crops, small quantities of lime only are needed and it is generally preferable to use the sulphate of lime, gypsum or plaster of Paris, which besides being cheap contains sulphuric acid which is an active stimulant to vegetable growth. If you have a clover ley to turn under this season, experiment with lime on a small piece at the rate of fifty bushels per acre, sown broadcast after plowing. If the result is favorable you will know what to do without asking any advice. Try also other fertilizers to test what the soil needs.

(2.) It will pay to harrow wheat just before sowing grass seed. The wheat and the clover catch will both be better for it, though the harrowing will make the wheat look worse for two or three days after the operation. Harrow if possible just before a good rain.

A Subscriber.—I would like to get some information through the RURAL in regard to fruit trees. I think of setting about $500 worth of trees this spring, and would like to know. (1) What are the most profitable kinds and (2) which are the most reliable nurseries to buy of. Will give you a list of what I intend setting:

200 pear trees; 350 quince bushes; 100 apple trees; 50 plum trees; 1000 raspberry bushes; 300 feet edge fencing.—*Providence, R. I.*

ANS.—APPLES: Baldwin, Fall Pippin, Gravenstein, Hubbardston Nonsuch, Keswick Codlin, Peck's Pleasant, Rhode Island Greening, Roxbury Russet, William's Favorite.

PEARS: Bartlett, Belle Lucrative, Beurre Clairgeau, Beurre d'Anjou, Duchesse d'Angouleme, Lawrence, Sheldon.

QUINCES: Portugal Apple or Orange.

PLUMS: Washington, Coe's Golden Drop, Imperial Gage, Purple Gage, McLaughlin.

RASPBERRIES: Philadelphia, Orange, Mammoth Cluster, Doolittle. So much depends upon soil and situation and it costs so little to test the adaptability of varieties to each locality that we would recommend you to try the following: Thwack, Highland Hardy, Florence, Delaware.

EDGE FENCING: If for ornament, American or Siberian Arbor Vitæ. The Red Cedar (Juniperus Virginiana) is also adapted for this purpose beyond what is generally supposed.

(2) In almost every issue of the RURAL will be found the advertisements of nurserymen all of whom are quite trustworthy. Send for their catalogues—compare and judge for yourself.

M. D. D., Toledo, Ohio.—Will the RURAL please tell me in "Answers to Correspondents" what is the matter with my ivy, two leaves of which I inclose. Also the means of destroying what I suppose to be a parasite on it.

ANS.—This is a scale insect. Wash the leaves and stems with a soft tooth brush and warm water and soap.

Querist, Tecumseh, Mich.—Will the RURAL please publish a general rule for the propagation of house plants from slips or cuttings, season, soil, and condition of plants?

ANS.—Different cuttings require different treatment, which could not be given in detail in this column. The present is a good time for general propagation. Flower pots or boxes well drained and filled in with pure sand, either white or red, answer the purpose. Make cuttings from two to six inches long, and insert them an inch deep in the sand and an inch or so apart. Keep the sand moist, not wet, and place in a sunny window. Cuttings of a stocky growth should be selected and cut just under a joint.

ANS.—In answer in part to J. J. D., Woodson County, Kansas, on page 160 of RURAL NEW-YORKER. If Mr. D. will send some of the hide of his hogs, where the hair has been lost in patches, to Mr. WALTER FAXON, Museum of Comparative Zoology, Cambridge, Mass., he may find that the pits which contained the hairs have been inhabited by certain mites known as Demodex. The hide should be put, while fresh, in a bottle of alcohol or strongly alcoholic liquor of some kind. This explanation of the loss of hair is only a conjecture, based upon certain very interesting and valuable observations lately made by Mr. FAXON upon the loss of hair and ruination of leather of cattle-hides. It seems as if carbolic soap would be a good remedy for the Demodex, in case they are present.

O. K. C., Beloit, Wis.—Please let me know through your columns if you think JNO. GARMORE, Covington, Ky., who advertised in the RURAL NEW-YORKER, is to be trusted.

ANS. We cannot say, of our own knowledge. He is represented as being what he represents himself to be. Whether his skill as a medium is sure to work cures, we cannot, of course predict.

J. H. K.—Will the RURAL please state what it knows about the "Wood Organ?" Whether it has the preference, or what one has? Reading the advertisements I can tell nothing about it, for they are all alike puffed.

ANS.—The preference as between the leading makers is mostly a matter of caprice or conviction through the efforts of an active agent. All are good, and some are only distinguished by inconsiderable variations of tone, or peculiarities of the stops. The Wood's Organ is a good one, and in purchasing, if you propose doing so, you will have a serviceable instrument.

F. R. M., Seneca Falls, N. Y.—(1) What book on botany would the RURAL recommend to one who has a common-school education, and wishes to pursue the study at home without a teacher? Can you (2) give me a better description of Hydrangea paniculata grandiflora (mentioned in last week's RURAL) and (3) would it pay to purchase one to plant in Seneca Co., New York?

ANS.—(1) Gray's "How Plants Grow" for the first. Gray's Structural Botany for the second. You will not need any other teacher if you study them assiduously. (2) We have already said so much of this Hydrangea that we must refer you to back numbers. It is perfectly hardy, every stem terminates with a panicle of flowers, from six inches to a foot long. The flowers are first greenish-white, then rose. It is a coarse plant, but has much to commend it. (3) Certainly. Even small plants from last year's cuttings will bloom profusely.

Mason Hamilton, Wyoming Co., N. Y.—noticed in the RURAL, sometime last year, a plan for making a gate. It was fixed so that it could be raised or lowered at pleasure. If it was in the RURAL, please let me know through Answers To Correspondents.

ANS.—An illustration and full description of the gate referred to, appeared in the RURAL of August 18, 1877, under the heading: A Novel Farm Gate.

News of the Week.

NEWS OF THE WEEK.

DURING the past week, news, domestic and foreign, has been extremely meager and uninteresting. At home, Maine has again gone Republican, with a loss of about 1,200 to that party, and a corresponding gain to the Democrats. Montgomery Blair again forced his resolution denouncing the tenor by which Hayes held the Presidency, before the Maryland Legislature, but failed to secure a majority in favor of his views. The air in Washington seems to be full of reports of a projected coalition of discontented Republicans and Democrats with a view of ousting Hayes and installing Tilden in the White House. A bitter attack has been made in the Senate by Senator Blaine on the award of $5,600,000 made in favor of Canada by the Fishery Commission, and incidentally on the Belgian Minister, Mr. Delfosse, one of the commissioners, who is supposed to have been swayed in his decision by British influence. The general opinion seems to be, however, that national honor requires the payment of the award, however distasteful.

Across the Atlantic, the war-clouds temporarily dispersed by the signing of the treaty of peace between Russia and Turkey, are again gathering. The pro-Russian party in England having been silenced by an outburst of popular anger of unexampled violence, the Prime Minister, Disraeli, having the favor of the Queen, a large majority in Parliament, and the people behind him, finds his back-bone marvelously strengthened and is making vigorous preparations to secure weighty consideration for the opinions of Great Britain with regard to the proper settlement of the Eastern Question. At all the dockyards, armories, and manufactories of warlike material throughout the country, men are working until late in the night, hurrying forward preparations for war. Several iron-clads built for foreign governments, and among them one built for the late Confederacy, have been purchased by the Government. More vessels have been sent to the Mediterranean and an addition of four iron-clads made to the fleet in the Sea of Marmora. Permission has been obtained from the Porte to land troops on the Island of Tenedos; and, all together, England boasts of being better prepared for war than she has been for many a day. Austria is also discontented with the terms of the late treaty, and negotiations are in active progress between her and Great Britain with a view of forming a hostile alliance against Muscovite aggrandizement. Russia is by no means idle. Names are being enrolled throughout the empire for a fresh levy of troops; entrenchments are being thrown up across the peninsula of Gallipoli, so as to prevent the advance of any British troops landed at that point; the Muscovite troops have crossed the river between Makri Kol and San Stefano, and occupied three villages near the former euphonious suburb of Constantinople. Nay, despite the protest of Turkey, they have occupied Domousdere, behind Bujerkdere, and at the mouth of the Bosphorus, and declare that England has decided on war and is cavilling only to gain time. Meanwhile, diplomats are busy trying to arrange a peaceable solution of present difficulties, and the telegraph wires are loaded with innumerable contradictory and conjectural announcements. England insists that every clause of the late treaty shall be submitted to the action of the proposed Congress or Conference: Russia consents that all the conditions which the assemblage may desire to review shall be submitted to them, and Germany and Austria are reported to think this quite satisfactory enough. The latest reports, however, say that Bismarck has persuaded the Czar to yield to Great Britain. The date of opening the Conference or Congress has been deferred till the 15th of April, at least, and it is proposed to hold a preliminary council of the plenipotentiaries to decide what questions shall be acted upon. The Pope has given permission to Italian bishops to become reconciled to the Government, thus recognizing semi-officially the loss of the temporal power. He has also written to the Emperor William informing him of his election to the papacy—an act of courtesy doubtless preparatory to a settlement of existing difficulties.

Kosciusko, Miss., is a model place to emigrate to. Butter, 15 cents a pound; rib beef, at 4 cents chickens, 12 cents each; and eggs, 8 cents a dozen are the latest quotations.

Manufacturers of Clothing and ladies' suits find the New Davis Sewing Machine adapted to the full range of their work, trimming, binding, sewing thick and thin goods, over-seams, without any difficulty, and requiring no basting or change of tension. The DAVIS SEWING MACHINE Co. are enlarging their manufactory at Watertown, N. Y., to enable them to supply the increasing demand for their machines.

Reliable help for weak and nervous sufferers. Chronic, painful and prostrating diseases cured without medicine. Pulvermacher's Electric Belts the grand desideratum. Avoid imitations. Book and Journal, with particulars, mailed free. Address PULVERMACHER GALVANIC Co., Cincinnati, Ohio.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 16, 1878.

BEANS AND PEAS.—There is a trifle of better feeling in medium but sales are moderate. Marrows continue quiet; exporters will not invest heavily until Cuban affairs are settled, regardless of the low home prices. White kidneys dull. It is unusual to see these three leading sorts of beans so close in quotations as they now are. Red Kidneys sell fairly at the extreme if choice. Green peas have revived somewhat and now bring $1.15@2.20. Canadian peas, 83@84c. with a fair business. Exports past week 13,350 bush. Southern B. S. peas lower the light demand not supporting the high rates.

We quote:—Beans, medium choice, $1.70@1.72; other, $1.45@1.55; marrows, choice, $1.70@1.75; other, $1.55@1.65; pea, $1.55@1.80. White kidney, choice, $1.70@1.80; other, $1.55@1.95; red, choice, $2.25@2.50; other, $2.35@2.40. Turtle soup beans, $1.50. Lima, $3.

BEESWAX.—There have been small offerings yet but little demand; Western and Southern quoted at 27@28c.

BROOM CORN.—Wants of manufacturers are small and stocks are ample, with prices, however, essentially as quoted last week.

Green brush at 6@7½c.; green hurl, 5@6½c.; medium green, 5@6¾c.; red-tipped, 4@5c., and common red, 3@3¾c.

BUTTER.—Receipts for the week 15780 packages. Fine old butter is reduced to a nominal quantity; nothing remains good enough in quality to make wholesome trade, at the rate of a fortnight ago. An indication of our burdensome surplus of old, is the fact that full dairies are quoted at this late date. There is some export movement in both State and Western, but it is most likely that some stock will go abroad on owners' account; this forcing distribution of stocks will not be apt to lead to a profit. There are enough straggling and regular lots of new white to make the price list we annex. Old Western has merged from grease rates to 11@12c for well procured stock.

OLD.—State dairies, good to choice 23@27c.; fair, 20@22c.; from 11@18c; selected firkins 26@28c; fair to good 18@21c; poor 14@18c; selected half tub 30@31c; other, 24 28c.; choice Full Welsh 28@30c. Fair to prime 20@24c.; Welsh dairies, 25@26c. State creamery, 30@32c; other, 30@32c.; other 23@28c; Western factory, fresh, low goods worth 7@10c.; greese 6½@7c.

NEW.—State, half tubs choice, 32@33; good 29@31. Welsh first, 31@32; second, 27@30c; poor now, 23@26c; Western creamery ranges at 25@35c.

Exports past week, 2697 pkgs.

CHEESE.—Exports for the week, 24,336 boxes. These fair shipments have been brought about by yielding prices. Supplies have been freely offered on account of the early, mild weather and prospects that the new make will be earlier than usual. The best of the factories here have sold at 13@13½c., and these are the top quoted rates, while many very good lots have been sold relatively low.

Fancy factories, 13 13½c.; good and prime, 12½@12¾c.; fair lots, 11@11½c.; poor, 10@10½c.; 7@10c., skimmed. Farm dairy, 11¼@12¾c. for good to prime: 10½@11½c. for fair lots: 8@10c. for skimmed; Western factory, cheddar, 12½@13c. for fine; 11@12½c. for good; 6@10c. for poor.

Liverpool cable, 63s. Gold closes 101¼.

Exports for the week, 24,393 boxes.

COTTON.—There has been but little done for export, and prices have been easy. The English advices have been very tame, and have discouraged export demand.

Latest prices are for March, 10.94@10.95c.; April, 11.02@11.03c.; May, 11.17@11.18c.; June, 11.27@11.28c

July, 11.25@11.26c.; August, 11,41@11.41c.; September, 11.24@11.25c.; October, 10.88@10.89c.; November, 10.76 @10.77c.; December, 10.78c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	8⅜	8⅜	8¼	8¼
Strict ordinary	8¾	8⅜	9	9
Good ordinary	9 5-16	9 5-16	9 7-16	9 7-16
Strict good do	9 13-16	9 13-16	9 15-16	9 15-16
Low middling	10¼	10¼	10⅜	10¾
Strict low middling	10⅜	10⅜	10⅝	10⅞
Middling	10 15-16	10 15-16	11 1-16	11 1-16
Good middling	10 5-16	11 5-16	11 7-16	11 7-16
Strict good middling	11⅛	11¼	11⅜	11⅝
Middling fair	12⅛	12⅛	12¼	12¼
Fair	12⅝	12⅝	12⅞	12⅞

Stained.

Good ordinary, 8⅛c. Strict ordinary, 8⅜c.; Low middling, 9⅛c.; Middling, 10c.

DRIED FRUITS.—In apples the higher grades are sought after from home trade sources, and being in limited stock bring full prices; common grades have but little attention. Peaches and small fruits generally are without change, with a slow business.

Apples—State quarters, old, 5¾@6¼c.; new, 5¾@6¼c.; Western quarters, old, 6@6½c.; new, 5⅛@5¾c.; Southern, new, prime sliced, 7c.; fair to good, 5@5¾c. Peaches—Pealed, new, 9@10c.; unpealed halves, 4¾ 5c.; unpealed quarters, 3¾@4c. Pitted cherries, 15@17c. Blackberries, 9@10c. Raspberries, 26c. Plums, 15c. and Southern at 12c.

Exports past week, 756 bbls. apples.

EGGS.—Receipts for the week, 18,900 barrels. The market has here seldom so abundantly stocked at the early date with fresh and never has the demand been so apathetic. There is no demand beyond our local one at present and that fact helps to tame the tone. For best Western and Southern 12c. is extreme and there are grades selling down to 11c. Limed eggs are about out of market or what is equivalent, forced out of sight. State, 12@13c.

FEED.—A much better business is in progress and prices are strong. Sales 40 pounds ave. $20; 60 pounds ave. $19@20; 80 pounds ave., $19@20.

FLOUR.—There is a much more general demand for stock suited to exporters' wants, prices for which are stronger. The high grades are so plenty that the improved prices for wheat have scarcely helped them.

Latest prices are $4.10@4.75 for poor to fancy superfine State; $4.75@5.10 for common to fair extra do; $5.10@5.50 for good to choice do.; $4.10@4.75 for superfine. Indiana, Iowa, Michigan, Ohio, &c.; $4.75@5.10 for very poor to good shipping extra do do., (chiefly at $4.90@5.10) and $5.15@5.50 for good to choice extra do.; common to choice white extras, $5.35@6.65; fancy do. at $6.65@7.50; (the latter an extreme); red and amber winter wheat, inferior to choice trade and family, at $5.10@6.35; round hoop Ohio at $4.80@4.25, and trade brands of do, $5.40@6.75, the latter for choice; St. Louis, $5.25@6.10 for poor to fair extra and $6.10@7.00 for good to fancy; (with a few brands of very fancy quality quoted up to $7.25@7.50); Minnesota clear, $4.85@5.90; Minnesota "straight," common to fancy, at $5.60@6.75, and patent poor to very choice, $6.10@8.25, with a few fancy at $8.35@8.50; unsound stock at $2.25@5.75; city mill extra at $5.85@6.35 for fair to very choice for West Indies; do. for England $4.90@5.00; do. trade and family extras, $6.35@7.50; do. South America, $6.35@ 7.35 for fair to fancy; No. 2 at $2.65@3.00.

Corn meal is selling at $3.@3.10 for Brandywine and $2.50 to $2.80 for yellow Western.

FRESH FRUITS.—Exports of apples 1000 bbls, mostly strong Russets. Apples are quiet but fairly firm. Choice Red and best Russets, $4.50@5 fair to good, $3@4. Cranberries are going out well at former quotations. Strawberries arrive in bad order this season. Oranges scarce and salable $3.50@4. Peanuts quoted as in our last, the demand not as brisk as it should be in this style of weather; best, $1.35; others 85c. @$1.20 per bush.

FURS AND SKINS.—The London sales of the past week, Hudson Bay Company's stock, all show a decline except skunk. Otter declined 10 per cent.; Red Fox, Cross Fox and Fisher, 20 per cent.; Martin 20 per cent.; Mink, 25 per cent.; skunk advanced 25 per cent. or 40 per cent. above September's rates.

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₩ piece	$3 00@ 4 00	$2 00@ 2 50
Gray Fox	40@ 45	40@ 45

Skunk, black		50@ 60
striped		7@ 30
Wolf, mountain		1 50@ 2 00
prairie		50@ 60

Southern raw skins are worth 20 per cent less than Western.

GRAIN.—Wheat has been in stronger export demand, and with reports of a lighter movement forward of supplies than had been expected, prices are better and strong.

Latest sales are of No. 2 red at $1 32@1.33 ungraded red and amber State, $1 32@—; white, $1 40; No 1 Northwest spring, $1 27; No. 3 Chicago, $1 22½; No. 2 red for March at $1 21½; No. 2 Milwaukee spring, $1 27. Rye is a trifle steadier; sales of Western at 73@75c.; State at 71@73c. Barley, 96c for No. 1 Canada; 85@86c. for six-rowed State. Corn is weak and quiet. Latest sales are of New York No. 2 at 59@59½c.; steamer mixed, March, 51c. Oats of New York extra white, at 30½@37c.; do. No. 1, March 35½c.; No. 2 white, 35½c.; mixed Western, 34½@36c.; white Western, 35@41c.

HAY AND STRAW.—With river navigation resumed supplies have increased, but demand is very good and prices are sustained.

Bale hay, 65@70c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 45@ 50c. for long rye; 45@50c. for short rye, and 40@45c. for oat.

Exports since Jan. 1st, 13,600 bales; about the same as last year this date.

HIGHWINES—$1.08½@1.09 regular.

HONEY.—In a small way has sold as low at 8@10c. for white.

HOPS.—The export movement this week has been very moderate, and there has been a little more of an effort to sell, which has led to a little irregularity in prices for the common and medium grades.

State choice to fancy, 11@13c.; good to prime, 8@ 10c; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Californians, 12@14c.

LEATHER.—Hemlock sole, 20@21½c. for light, 20@ 21c. for middle, 20@22c. for heavy, 18@19c. for good damaged.

MAPLE SUGAR.—Increased supplies are attended with lower prices for molds and strup. Small cakes, 13c.; large, 10@12c. Strup, 75c.@$1 ₩ gal., with can.

OIL-CAKE.—Western is quoted at $30@$36.25 ₩ ton.

POULTRY AND GAME.—Live poultry is now quite an active feature. City dressers are operating quite regularly and fair prices are reported.

N. J. chickens, 10@13c.; W. fowls, 12@15c.; Turkeys, @14c.; Toms, 6@8c.; Ducks, N. J., pair, 57@$1.12; Geese, N. J., $1.75@2.00; Western, $1.12@1.50.

Fancy Phila. and N. J. turkeys, 12@14c.; good, 8@ 9c.; large or Toms, 7@9c.; chickens, choice, 8@9c; good, 11@13c.; common, 6@7c.; ducks, choice, —@18c.; other, 15@16c.; geese, fancy, 11c.; other, 7@9c. Capons large 21@22c. small and slips, 18@19c.

Our near points can now supply the dressed poultry wants with fair receipts of live.

Warm weather and free receipts of the few sorts of game have depressed the market.

Hares and rabbits, pair, 20@25c. Canvas-back ducks, $1.00@1.25; Red-heads, $1.00; Mallard, 60@75c.; Teal, 25@40c.; Quail, prime, $2.75@3.00; soft, $2.25@2.50. Partridges, pair, 75c.@$1.00. Grouse, $1.00@1.50; poor, 90c.@$1.10.

PROVISIONS.—Hog products have been in freer demand for export and have hardened a little in price.

Mess pork, $10¼@10.40 for spot lots; $10.25@10.35 for March and April. Bacon at 5¼c. for long clear and 5¾c. for short clear. Lard—Western steam, 7 37½c. 7.40c. for short, 7.35@7.37½c. for April, 7.45@7.47½ Tallow at 7 9-16c. for prime. Stearine, 7¾c. for prime Western. Beef hams at $16.50. Beef—New extra mess, $12.00@12.50; plain, $11.00@11.50; new packet, $14.75; family mess, $17.50; extra India mess, $27 for city brands; do. Philadelphia, $25.

SEED.—Grass are in good demand and higher. Clover, 8@8½c. for Western; 8¼@8¾c. for State. Timothy, $1.37½@1.40. Rough flax, $1.50.

TOBACCO.—Demand continues moderate and prices are easy yet, notwithstanding recent figures have been exceptionally low.

KENTUCKY LEAF.

VEGETABLES.—There is a weak feeling in potatoes especially in Rose, holders fear sprouting and are anxious to sell.

We quote Peach Blows $1.50@1.75, bulk and double-heads. Early Rose, $1.62@1.87; Peerless, $1.25@ 1.50; Nova Scotia, $1.25@2.00; Sweet, $2.25@2.50. Cabbages, 100, $3.00@4.00; red, 5@6. Marrow squash, bbl., $1.50@2; Hubbard do., $2.00@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 62@75c. Red and yellow onions, $1.00@1.25; white, $1.25@1.75. Celery, doz., 75c.@$1. Hot-house mushrooms, ₩ lb., 20@40c. Radishes, 100 bunches, $4@4.50. Lettuce, small, dozen, 75c.; large, $1.50@$2. Cucumbers, doz., $3@3. Rhubarb, doz., $1. Spinach, Southern, $1 75@ @2.25 ₩ bbl. Bermuda, $1.50@5.

WOOL.—There has been but little demand from manufacturers, and the advancing season exerts rather a pressure to sell, with slightly easier prices.

Ohio, Pennsylvania and Virginia—XXX and picklock, 41@42c.; XX, 42@43c.; X, 42@43c.; No. 1, 43@44c. No. 2, 35@37c.; common, 30@35c.; combing, 52@55c.

New York, Michigan, Indiana and Wisconsin—XX, 36@38c.; X, 36@38c.; No. 1, 38@42c.; No. 2, 38@36; common, 32@34c.; combing, 46@50c.

Iowa, Vermont and Illinois—X and XX, 35@37c.; No. 1, 37@40c.; No. 2, 32@34c.; combing, 45@50c.

Missouri, Kentucky, and Tennessee—Washed fleece, 32@42c.; unwashed, 25@30c.; unwashed combing, 30@36c.

LIVE STOCK MARKETS.

NEW YORK, March 11, 1878.

BEEVES.—Receipts for the week, 8,029 head; do., last week, 7,823 do. There is quite an unusual falling off in the demand for meats—dull times and Lent making a severe combination for dealers. Prices at the cattle yards are tame, and the closing rates are quite as low as at our last, being 7¼@9¾c. for ordinary to picked steers. These prices have not been exceeded during the week; choice to extra 10@10¾c; fulls 8.80@9.25 for 100 live. Still fed Texas and Cherokee 8@9¼c; a previous lot of stillers from same points brought 8¼@9c. About 400 fat exporting steers brought 9¾@10¾c. The market all around is fully $1 per head higher than on Wednesday last.

COWS AND CALVES.—Market more than supplied. The nominal quotations are $40@60 ₩ head for good to choice. Late rates are more readily named as we may expect better qualities with spring.

VEAL CALVES.—Not enough live have arrived latterly to establish new rates. Recent rates, 6@7½c. Hog-dressed are neglected, as the weather has been against them—8@9c—ordinary stock say 112 lbs. sold at 7c; "Bobs" are promptly squelched by the sanitary authorities.

SHEEP AND LAMBS.—Receipts for the week, 17,077 head; do., last week, 17,878 do. Receipts continue light, but seem fully equal to the demand, the market, as a whole, seeming weak. Last week 17,677 do Quotations for sheep, 5.35@6.25c. ₩ lb.; choice State lambs, 6.50c. Spring lambs are too small to be attractive. Market unsettled.

SWINE.—Receipts for the week, 25,210 head; do. last week, 27,822 do. Market weak; a sale of Ohio live 4¼c. Country-dressed pork—State and New Jersey, 4¾@5c. for heavy to light.

TO PRESERVE THE HAIR,
Stimulate its Growth, and render it soft and glossy, use Dr. Jayne's Hair Tonic. This unequaled dressing for the hair, being free from all deleterious substances, exerts a beneficial influence on the scalp, removes dandruff, and in most cases causes new hair to grow.

Reading for the Young.

WHAT CAN I DO?

WHAT if the little rain should say,
"So small a thing as I
Can ne'er refresh the thirsty fields,
I'll tarry in the sky."

What if the shining beam of noon
Should in its fountain stay,
Because its single light alone
Cannot create a day.

Does not each rain-drop help to form
The cool refreshing shower?
And every ray of light to warm
And beautify the flower?

MRS. SKIMMERHORN.

M. E. STONE.

SHE was dead sure enough! An old crape vail hung on the door-knob, and the undertaker had been seen to enter the house—tape measure in hand—with a smile on his face which said plainly, "My errand is not to be in vain this time!" Poor man! he had been called there often before, and his expectations raised by her declaring very solemnly, she didn't think she should live an hour longer, and that he'd better go to work on the coffin. Nor was his errand in vain, for all that was left of MARINDA SKIMMERHORN was laid out in the front room, and her husband, PETER SKIMMERHORN, was sitting beside the corpse.

The deceased had considered herself an invalid for over thirty years, though in what her particular malady consisted physicians could never decide. Some were heretical enough to hint quite openly that it was purely imagination. Suffice it to say she was an invalid (?) and not a day passed over her head but that she *seemed* to fully expect to make her exit. It was always the first thing in the morning, and the last thing at night: "I feel that my arthly end is nigh, PETER," Still, it proved to be pretty long in ending, after all. So long, that when it was known she had really departed, it filled the whole village with surprise. And she might have been living yet but for her own act: Mrs. SKIMMERHORN had poisoned herself. Not that she intended to commit suicide, no indeed; but through some strange mischance she had taken a dose from the wrong bottle, and gave up the ghost.

PETER SKIMMERHORN bore it remarkably well. As he sat by her side in the front room he was able to bear up under the terrible blow with such fortitude that he smiled quite often, and talked quite cheerily with the undertaker about the coffin, while he held one end of the tape measure to get the exact length. "I want a fair to middlin' coffin," he explained; "not too expensive, but one of these ere kind that screw down tight, —*tight!*" he repeated emphatically, for he evidently cherished some inward fears that she might conceive the idea of returning to this "arthly" sphere again if she were not properly confined.

"She looks natural," said the undertaker, turning back the sheet and disclosing to view a screwed-up, vinegar face, which looked for all the world as if she were about to wake up and administer a good round scolding to some one. PETER shuddered and drew back. "Very," he remarked; "but I guess you'd better clap down that ere sheet, for I've heerd tell on as how air turned 'em black."

The undertaker did as he was bid, muttering to himself, "I bet the old 'un took *her!*"

That night PETER SKIMMERHORN poked the fire briskly, and turned up the lamp an inch higher than usual, proceedings which would have filled the corpse with horror, for Mrs. SKIMMERHORN had been very saving and, although an invalid, her eyesight had remained remarkably keen. Nothing ever escaped her. "Turn down that light, PETER SKIMMERHORN," she would have screamed; "shut that stove, this instant. You'll die in the poor-house yet." And he would have complied with trembling haste, for she possessed the faculty of making everybody obey her whether they would or not.

Oh she was a hard woman! a scrimping, pinching, driving woman—as far as others were concerned, with a tongue as sharp as an adder's sting. She could count all the sins of her neighbors for miles around, on her fingers. She knew all their little weaknesses and follies better than they did themselves. How they loved her! No one ever loved Mrs. SKIMMERHORN, not even her spouse, who, if rumor is correct, married her for the little sum of hoarded earnings she possessed. He got the worth of his bargain, as one generally does.

Now she was dead, really dead. As he sat by his lonely hearth he fell to thinking of the widow with the soft voice, and pleasant smile, over the way. He even went so far as to picture her sitting just opposite in MIRANDA SKIMMERHORN'S best chair. Oh, if she could only have known! If she could only have pounced out at him for such vile heresy, and frozen the smile upon his traitorous lips. He was looking really happy. For the first time in over thirty years he had passed a day in peace. No one had fretted or scolded at him, and he had enjoyed it, as I fear we should in a like case.

He bore no love for the still form in the other room, because she had never bestowed an atom upon him. She had never said, "dear PETER I love you." She had never stroked the thin locks from his forehead with a tender touch; she had never drawn out the easy chair and placed his dressing-gown near the fire to warm at night; she had never planned pleasant little surprises in the shape of his favorite dishes; she had never peeped in the glass to make sure her hair was smooth and her collar straight when she heard his steps in the hall. No, she had never done one of these things which are so little themselves, but mean so much.

She shut her heart to all such foolish feeling. Nobody ever expected or looked for sympathy from her. The idea of making others happy never occurred to her. Lifting burdens from other's backs was superfluous, her own was heavy enough. She went through life nursing her own little troubles until they became mountains in her sight. She found fault with her neighbor when she should have been all sympathy and kindness. She continually looked for evil, and passed the good by unnoticed. But now she was dead. The moonlight streamed in through the shutters and shone faintly on the white face as she lay there, in her coffin, all alone, in the dead silence of the night. Yes, all alone Mrs. SKIMMERHORN for your spouse in the outer room has his own sweet dreams to dream, and they are not of you.

The parson, after making a short prayer, turned to speak a few words of consolation to the bereaved husband, but he saw they were not needed. There sat PETER SKIMMERHORN at the head of the coffin, smiling serenly. Alas! he had forgotten himself, and was thinking of the widow again.

Not a soul whispered, "I'm sorry; it's lonely without her." Not a tear had been shed. The sexton filled up the grave with stones, rounded it over with gravel, and went home.

The Puzzler.

REVERSALS.

1. REVERSE before, and find a volcano.
2. A fish, and find a Confederate general.
3. A blow with something soft, and find wicked.
4. Lace in the front of a bonnet, and find a bird-like animal.
5. A native of Tunis, and find an apartment.
6. A measure, and find a mode of entrance.

CROSS-WORD ENIGMA.—Jackdaw.

Sabbath Reading.

BIDE A WEE, AND DINNA FRET.

Is the road very dreary?
Patience yet!
Rest will be sweeter if thou art aweary,
And after night cometh the morning cheery,
Then bide a wee, and dinna fret.

The clouds have silver lining,
Don't forget;
And though he's hidden, still the sun is shining;
Courage! instead of tears and vain repining,
Just bide a wee, and dinna fret.

With toil and cares unending
Art beset?
Bethink thee, how the storms from heaven descending
Snap the stiff oak, but spare the willow bending,
And bide a wee, and dinna fret.

Grief sharper sting doth borrow
From regret;
But yesterday is gone, and shall its sorrow
Unfit us for the present and the morrow?
Nay; bide a wee, and dinna fret.

An over-anxious brooding
Doth beget
A host of fears and fantasies deluding;
Then, brother, lest these torments be intruding,
Just bide a wee, and dinna fret.

S. E. G., in Leisure Hour.

THE PRECIOUS STONES IN THE BREAST-PLATE.

G. P. D.

PRECIOUS stones are often referred to in the Scriptures. David collected them to ornament the temple; the Queen of Arabia presented such to Solomon; while others were brought to him by Hiram's ships from Ophir. Royal ornaments of this description were set in the crown of the Ammonitish king, which David placed on his own head. Inserted in the high-priest's ephod, they were inscribed with the names of the twelve tribes.

But the breastplate of Aaron, the High-priest, claims our special notice. It was originally two spans long and one span broad; but when doubled it was square, and was thus worn. It was fastened at the top by rings and chains of wreathen gold to the two onyx stones on the shoulders, and below by two other rings and a lace of blue to two corresponding rings in the ephod. The breastplate contained twelve precious stones, upon each of which was engraved the name of one of the twelve tribes of Israel.

1. The *sardius* had Reuben's name, and was the sixth in Revelation, a red or reddish stone, supposed by some to be the carnelian, much admired and valued, the finest specimens of which come from Arabia.

2. The *topaz*, with Simeon's name, is the ninth in the Revelation. Critics say that this is rather the modern chrysolite, a transparent stone, beautifully bright, a lustrous green color, often found in Egypt or Nubia.

3. The *emerald*, with Levi's name, and the fourth in the Revelation, its Hebrew word signifying to *lighten* or *glitter*. This stone has a grass-green color, possessing a double refraction, rare, valuable and uncommonly beautiful. Formerly it was found only in Upper Egypt, but now also in South America. This green color adorned the rainbow seen by St. John around the throne of God, the beautiful symbol of Divine grace and mercy.

4. The *ruby*, having Judah's name and the fourth of Revelation. A dark red color gives it the appearance of burning charcoal, whence its other name, *carbuncle*, is derived. Next to the diamond, it is the most costly.

5. The *sapphire*, with Dan's name. This is the second in Revelation. It possesses a fine sky-blue hue, and is next to the diamond and ruby in hardness.

6. The *diamond*, with Naphtali's name. Some say that the Hebrew word should be translated onyx, the sardonyx, or the fifth in Revelation.

7. The *ligure*, having Gad's name, the same as jacinth, or hyacinth, a valuable stone of a red or cinnamon color, with yellow and green shades. Some suppose this gem is the modern opal.

8. The *agate*, having Asher's name. Some think it to be the chrysoprasus, or the tenth in Revelation. It is most finely variegated, seemingly to represent streams, clouds, flowers, the stars, etc., on which account it has ever been prized, but it is of low value among precious stones.

9. The *amethyst*, with Issachar's name, the twelfth in Revelation. It has a strong blue and deep red or violet color. The ancients supposed that it caused dreams, and that wine drunk from an amethystine cup would not intoxicate.

10. The *beryl*, with Zebulun's name, supposed to be the chrysolite of the ancients, the seventh in Revelation. It has a pellucid, blueish-green color, is found in the East Indies, and ranks among the modern topazes.

11. The *onyx*, with Joseph's name, and probably here the *beryl*, the eighth in Revelation. It is a green or blueish precious stone, allied to the emerald. It ornamented the ephod of the high-priest.

12. The *jasper*, having Benjamin's name; not the jasper of the moderns, for in Rev. xxi 11. It is a perfectly transparent stone, of such a brilliant luster that St. John compares it to the glorified body of the Son of man. A common jasper, entirely opaque until polished, would not at all answer for this holy comparison.

The precious stones are also introduced figuratively in the Scriptures. Solomon compares to them the gifts which a man bestows, and by which he acquires honors. St. Paul likens the Church of Christ and the life of a Christian to a structure composed of gold, silver, and precious stones.

Of the high-priest's garments, and the precious stones in his breastplate, doubtless it may be said they were all emblematical of spiritual and holy things, "but of which and in what way," to adopt the language of Dr. Adam Clarke, "no man can positively say." "These were all made for *glory* and for *beauty*," is the general account it pleased the Lord to give of their design.

PERSONAL ITEMS.

The London News says that the late Pope was an expert billiard player, and when his health permitted, played every evening for several hours.

The advice of Dr. Peabody of Harvard College, for the acquisition of literary style, might safely be commended to others than those to whom it was originally addressed. The doctor recommended the students to read the Bible more and slop novels less, if they would have a good English style.

The Philadelphia Inquirer says it is proposed to give General Grant, on his return next autumn, a splendid reception, and enough money has already been pledged by the most prominent and wealthy citizens of that city to carry out the project. One of the features will be a grand demonstration of all the soldiers from the different parts of the country.

Trees, Seeds, Plants, &c.

Every Plow warranted. Send for Circular. Made only by LAWRENCE & CHAPIN, Kalamazoo, Mich.

Wit and Humor.

SPARKS AND SPLINTERS.

BRACKETS on the wall are handy things. By hitting them you always know when you reach the wall; they catch what dust is overlooked by the picture frames and center-table, and Sundays you are kept out of trouble nailing up those which have tumbled down during the week —*Bridgeport Standard.*

A CORRESPONDENT asks, What is the best method of feeding cattle in winter? We don't exactly know. One might prefer to take the ox on his lap and feed him with a spoon. Others would bring him into the dining-room and let him sit at the table with the old folks. Tastes differ in matters of this kind.

The Stinging Sensation

In the gullet called "heartburn," (why, it is impossible to conceive, since the heart has nothing to do with it,) is caused by the acetous fermentation in the stomach of the food contained in it; by an overplus of the gastric juice, which is itself a powerful acid, or by the unnaturally acrid quality of that secretion. The ordinary way of treating this symptom, for it is nothing else, is to administer bi-carbonate of soda, an alkali, to neutralize the acid. But sour stomach cannot be cured by alkalis, which tend to weaken the digestive apparatus. A far better remedy is Hostetter's Stomach Bitters, which strengthens the cellular membrane, the seat of the difficulty, regulates the flow of the gastric secretion, improves the quality if vitiated, and puts the stomach into good working order. Perfect digestion follows as a natural sequence, and there is no more trouble from heartburn or sour stomach. The liver and bowels are also thoroughly regulated by this sovereign alterative.

HOST:—What Gentleman says puddin?
IMPERTINENT GUEST:—No *Gentleman* says puddin!

Specialties for Farmers

East India, Egyptian or Pearl Millet.—This valuable annual forage plant has been illustrated and fully described in the American Agriculturist, Weekly Sun, Farmer's Advocate, and other papers. It is the best and most profitable plant for green soiling and fodder. Can be cut four to six times. One pound of seed will sow an acre. Price $5 per lb.; 25 cents per packet, or 5 packets for $1.00

Chufas or Earth Almond, (Cyperus esculentus). Better than corn for feeding hogs, sheep and poultry will yield three times as many bushels per acre. Price 60 cents per quart, by mail prepaid; $2.50 per peck; $8 per bushel,

Prickly Comfrey.—Recommended for the feeding and fattening of stock, and for increasing the milk of cows; enormously productive. Price of roots, $2 per lb., by mail, prepaid.

Compton's Early Field Corn.—Was exhibited at the Centennial Exhibition, where it received honorable mention for its extreme earliness. Price 60 cents per quart, by mail, prepaid; $1.50 per peck; $5 per bushel.

Circulars, fully describing the above, and many other good things, free by mail, to all applicants. Also, my Descriptive and Illustrated Catalogue of Garden, Farm and Flower seeds New and Rare Plants, etc., etc.

MAPES'
COMPLETE AND SPECIAL MANURES,
PREPARED FROM
Peruvian Guano, Pure Fine Bone, dissolved in Sulphuric Acid, Nitrate of Soda, Sulphate of Ammonia, Dried Blood or Flesh, and Potash Salts.

These manures are not only composed of materials which **in themselves** rank the **highest** as sources of **plant-food,** but contain them in the proportions which practical experience has demonstrated to be best adapted to the wants and habits of **EACH CROP.** They require no other manure, and improve the condition of the land for subsequent crops.

Truck Growers and Farmers report these Manures to be as effective as the *best stable manure,* and to cost less than half as much.

Analyses and full Directions for Use accompany each Package.

Mapes' Corn Manure.
Ammonia 4.50 to 5 per cent., Phos. Acid 10 to 12, Potash 6 to 7.
For 50 bushels shelled corn use 3 bags, 600 lbs.
" 75 " " " " 5 " 1,000 "
Price per ton, $49.50—per bag (200 lbs.), $5.20.

Potato Manure (Ville Formula).
Ammonia 4.50 per cent., Phos. Acid 5.97, Potash 13.64.
For 200 bushels Potatoes use 2 bags, 400 lbs.
" 300 " " " 3 " 600 "
Price per ton, $51.94—per bag (200 lbs.), $5.40.

Mapes' Grass and Grain Spring Top-Dressing.
Use one or two bags per acre for top-dressing winter grain or grass lands—also for hoed crops in hills or rows for producing rapid growth.
Price per ton, $51—per bag (200 lbs.), $5.35.

Mapes' Complete Manure.
Ammonia 6 to 7, Phos. Acid 10 to 12, Potash 3 to 4.
A general manure—a substitute for stable-manure—especially adapted for grain crops and grass lands—on soils requiring more Phos. Acid than Potash.
Price per ton, $500—per bag (200 lbs.), $5.25.

Mapes' Fodder Corn Manure.
Price per ton, $49—per bag (200 lbs.), $5.15.

Complete Manure (Ville Formula).
Ammonia 7.69, phos. Acid 5, Potash 7.69.
For use the same as the above, but adapted more particularly to light lands, or such as require more Potash than Phosphoric Acid.
Price per ton, $52.28—per bag (200 lbs.), $5.50.

Mapes' Beet and Mangold Manure.
Price per ton, $52—per bag (200 lbs.), $5.45.

Mapes' Fruit and Vine Manure.
For Trees of all kinds, Small Fruits, Strawberries, etc.
Price per ton, $35—per bag (200 lbs.), $3.70.

Mapes' Cauliflower and Cabbage Manure.
Price per ton, $40—per bag (200 lbs.), $5.10.

Mapes' Lawn Top-Dressing.
For Lawns, Croquet Grounds, Grass Plats, etc. 100 lbs. for 2,500 sq. feet.
Price per ton, $60—per bag (200 lbs.), $6.30.

Mapes' Spring Wheat Manure.
Very quick in its action—a complete manure for Spring Wheat.
Price per ton, $50—per bag (200 lbs.), $5.25.

The above prices include cartage, excepting when total quantity ordered is less than half a ton, then add 50 cents for cartage. Address

Fitzhugh American Hay Elevator.

The greatest labor-saving machine in use; will do more work in the same time and space than any other machine of the kind manufactured. Is very durable, easily put up and operated, and has the capacity of hoisting 2,000 lbs. and carrying it back any distance required. It has the merit of being readily adapted to any kind of a building. It has been awarded premiums at a great number of State and County Fairs, and received the highest prize—a Diploma and Medal—at the Centennial Exhibition—as the simplest and best of its kind. Exhibit shipped to Paris Exhibition. Over 5,000 have been sold since Sept. 1st, 1874, which have given entire satisfaction. A price-list and full particulars, with instructions how to put up and operate, will be sent on application to the Patentee and Manufacturer.

WHOLE No. 1470.

NEW YORK CITY, MARCH 30, 1878.

PRICE SIX CENTS.
$2.50 PER YEAR.

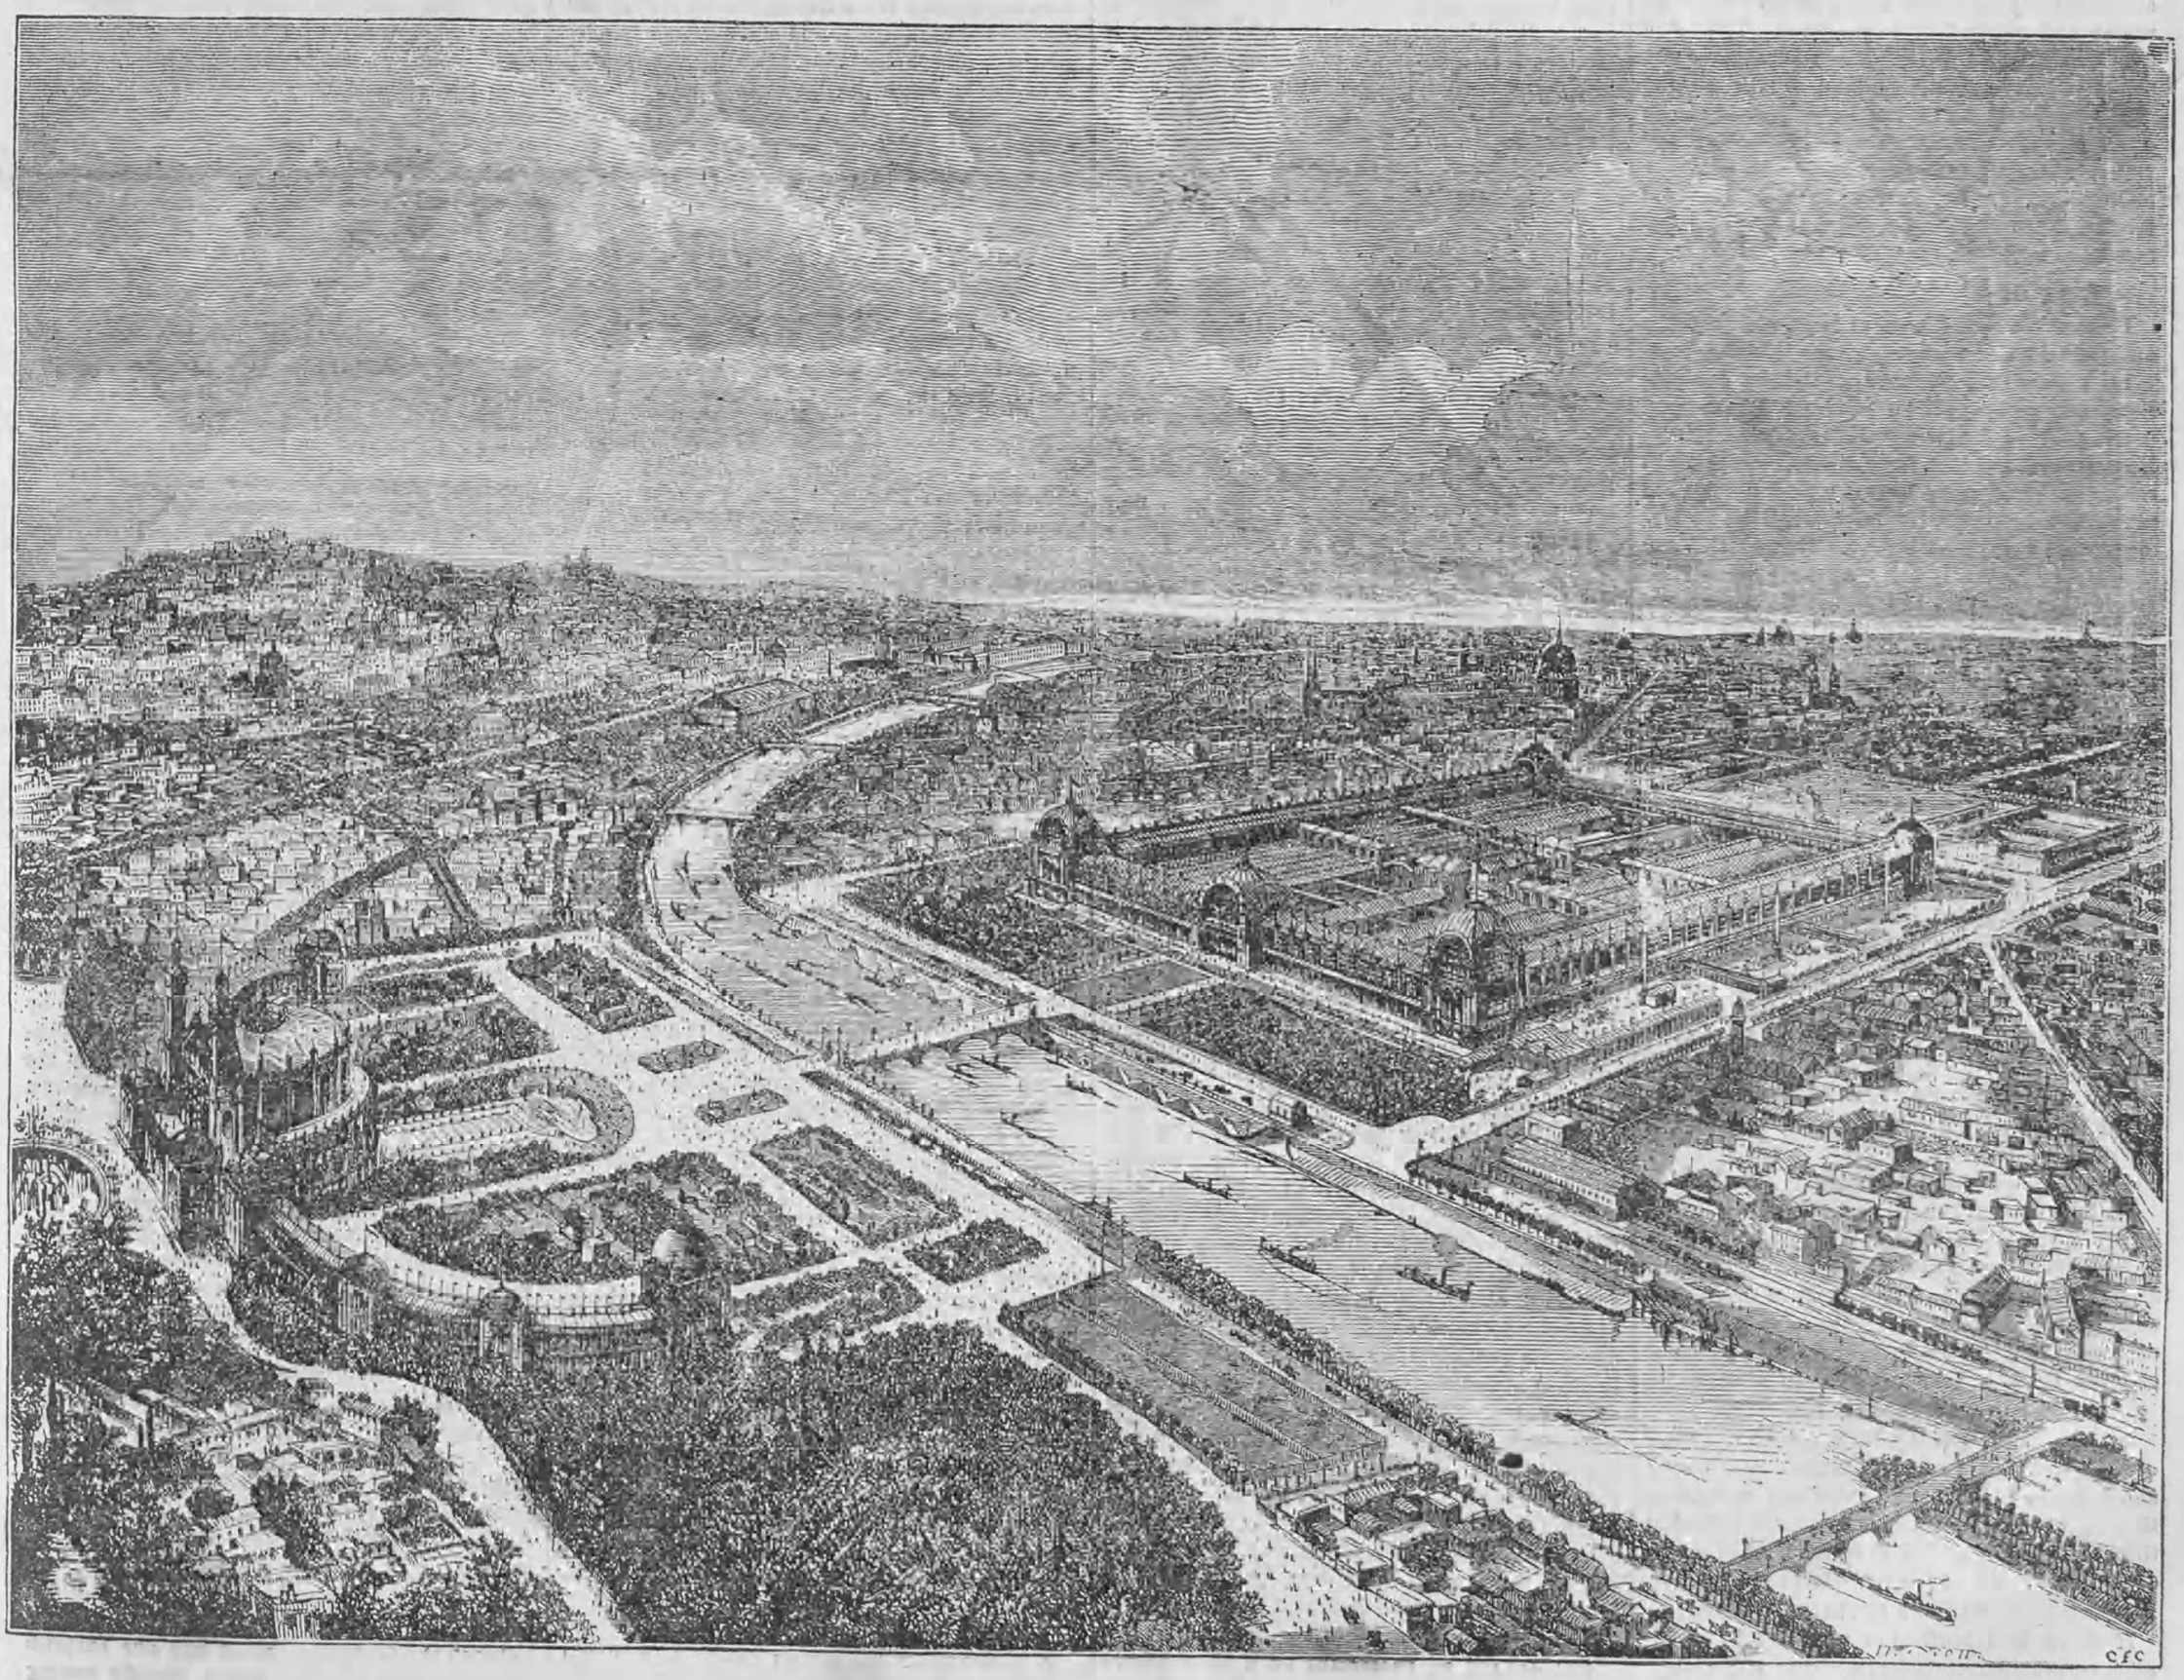
[Entered according to Act of Congress, in the year 1878, by the Rural Publishing Company, in the office of the Librarian of Congress at Washington.]

PARIS EXPOSITION.

FOUR vessels belonging to the Government have already left the port of New York for Havre, laden with American exhibits for the approaching French Exhibition; and a fifth will bear away in a few days the last of our contributions to the grand display that will crown the multitudinous attractions of the gay capital of France in the gayest month of the twelve—flower-bedecked May. The Champ de Mars, on which the Exhibition buildings stand, is a large military parade ground, usually bare and sand-strewn, but now covered with long lines of artistic edifices, and carpets of green verdure, spangled with flowers and shaded by groves that have sprung up as if by magical spell. The buildings are already in so forward a condition that there is no doubt of their being finished in ample time for the opening. The French are, of course, the most forward in their arrangements, and, already their show-cases are beginning to fill the spaces allotted to them. In this department there will be nothing worth knowing about France and its brilliant capital which will not here find an appropriate place. Among the features of the Exhibition will be a display of all the latest inventions of the electric light apparatus and of the telephone and its various offshoots, such as the phonograph. The pavilion of the city of Paris, in the center of the grounds, will contain models of everything belonging to that great city, its prisons, public works, its system of paving and drainage, models of its underground sewers, and everything that might interest or please the visitor.

On the elevated ground across the Seine, the palace of the Trocadero, which will be devoted to a display of the Fine Arts and to various kinds of amusement, is advancing rapidly to completion. This vast building can easily accommodate seven thousand people. The concert hall will hold 5000 people and the orchestra, besides 400 performers, can be so extended as to seat one thousand more. Of the external appearance of the building and its flanking pavilions as well as of its beautiful grounds and splendid cascades and waterfalls, an excellent illustration was given in the issue of the RURAL for Feb. 17th 1877.

But magnificent as will be the exhibits displayed at this World's Fair, to most of the visitors, the city of Paris itself will afford still greater interest and delight. Already she is making her toilet for the gay company she expects in May. All the public buildings are being burnished up externally and internally, and those in course of construction are being pushed rapidly to completion. Even to the old man who marveled at the splendor of the city in the days of his youth, its present aspect will be a matter of surprise and admiration. Covering an area of 18,315 acres, and containing a population of about 2,000,000 of the most artistic people on the earth, with 28 theatres subsidized by the government, and 150 other places of public amusement, with magnificent public buildings, long lines of finely-paved streets, shaded many of them, with rows of trees, flanked most of them with six-storied, balconied houses, no city in the world presents so artistic and attractive an appearence. For centuries it has been celebrated as the chief seat of learning in Christendom, but its present beauty of appearance is due almost entirely to the two Napoleons. The Man of Waterloo expended upwards of 100,000,000 francs in embellishing the city; the work thus inaugurated was carried on steadily but slowly during the reign of Louis Phillip and the two Legitimatist Kings, but it was only on the accession of the Man of Sedan to the imperial throne, that, the Nephew set vigorously to work to complete the rebuilding and adornment of the city, inaugurated by his Uncle.



VIEW OF PARIS AND THE EXPOSITION BUILDINGS.

Farm Topics.

NOTES FROM A FARM.

PRIDE ON THE FARM.

THREE years ago my neighbor, Mr. COWELL, built a very large barn which his neighbors, at the time, said he would never be able to fill from his farm with five years' produce; but last year he almost filled it with grain alone. Now how did he do it? He set men to work on his farm, cleared it of stone, bought a seed drill, used a small amount of fertilizers, and gathered with a reaper. The land in this section being about one-third covered with stone, he was enabled with skill, industry, energy and pride, and the aid of approved machinery, to reach this result. Pride is here mentioned, and I wish more farmers had it, if only it prompts them in the right direction; that is, to clear their farms of stone, build good fences, set out trees, paint their buildings and keep their stock in good condition.

ROADSIDE PASTURING.

Four or five years ago I was much annoyed with street cattle and stock, and after losing my garden, which was caused by one of my men leaving the gate open, I consulted my neighbor who had suffered in the same way, and we both concluded to take our roadside bars out and throw our fields open to the commons. This we did and soon learnt that the neighbor who had pastured the road-side had procured pasture elsewhere. To-day our road-sides are set out to fruit and shade trees as the result, and the roadside mowed the same as the fields and everybody happy that there is no stock in the road. At first our course was much condemned, but we have lived to receive blessings from the same men.

A BLESSING IN A HATEFUL DISGUISE.

Last summer, my neighbors were much surprised at the appearance of my corn field. On one quarter of the field the corn was about double the size it was on the other three-quarters. On their inquiring the cause of this, I told them the piece had been cultivated for seven years on account of fruit trees occupying the ground, and that the year before I had sowed it to buckwheat and planted it to potatoes. The large corn was where I had planted the potatoes and the bugs had fertilized the land, also perforated the ground with numerous holes, and let plenty of air into the soil, which scientific farmers say is very essential. Any way, the result was as I mentioned. The whole lot received the same treatment throughout the season. Perhaps potato bugs may be a blessing after all.

INTERCHANGING EXPERIENCE.

Brother farmers, please write your experience and the result of that experience in the agricultural papers that you take, so that by comparing notes, we may all be benefited. I have been much pleased by the "Jottings from Kirby Homestead," and look for them the first thing in the RURAL, and when I cannot find them I am much disappointed. Experience is what we farmers need more than theory. If we fail in our undertakings, do not let us be ashamed to tell it right out just as it is, so that others may not fall into the same errors. It may be a little humiliating to fail in what we try to accomplish, but that failure is worth something, to ourselves as a caution, and, to the public, for the same reason, if it is only made known. W. H.

Greene Co., N. Y.

FARM NOTES.

S. RUFUS MASON.

SETTING OUT RHUBARB.

DIGGING holes for each plant is a decided waste of labor; better plow out a dead furrow, fill in with old manure, in spots three feet apart, plow the earth back again, and set out the plants. A man could do ten times as much in a day in this way as by digging, and the work will be better when done.

THE FARM SLATE.

Keep a slate for the purpose, tie the pencil to it with a string, and make a loop to hang it up by. Write down upon it every little job to be done indoors and out. If you have boys, put their initials opposite such items as you wish each one to attend to, then when any one is out of a job, the slate tells him what to do next.

MANGEL-WURZELS FOR PIGS.

Let every man who expects to raise but a litter of pigs, put in a few rods of mangel-wurzels, and begin to feed out the thinnings as soon as they begin to crowd; keep the corn till fattening time. Instead of having to fatten a lot of stunted shotes, he will begin on 250 hogs at least.

NATURE'S FIRST LAW.

If there is a profession upon earth, which must be practised in order, it is that of farming. There should be a time for everything as well as a place, and more depends upon timing work on a plantation than almost on anything else. Good seed, good sowing, good plowing, good cultivation, are good only when employed at the right time, and many a man, if he looks back over 1877, will see that his failures arose from a disregard of Nature's first law.

ONION SETS FOR HORSES.

Ever since the epizootic year I have given my team a pint of onion sets every morning during winter and spring: they kept off the epizooty then and twice since, when it became threatening. I am satisfied they are very beneficial in other ways, as my team are never sick or off their feed. I use the "top onion," merely because they are plenty with us, and cheaper than other kinds, otherwise they are no better. They are always eaten before the corn.

QUERIES ABOUT MAPLE SUGAR MAKING.

I READ, this morning, Hector Bertram on maple sugar making, and agree with him on all points but one. Do not use the ax to make the box, but take the ax in the right hand and a sharp inch-and-a-half chisel in the other; hew off the rough bark with the ax; set the chisel, with flat side down at such an angle as you wish; strike lightly so as to cut through the bark, that it may not pull off about the cut; then place the chisel a half inch up the tree, driving it some distance into the wood; once more return to the cut at the bottom and drive the chisel in as far as you wish to go; now return once more to the top slit, and a blow or two on the chisel there, will bring the sloping cuts to an angle, making a neat and small cut that can be freshened at will with the chisel, and when the season is through you have but a small scar that will soon heal.

Such, I believe, to be the very best way to tap the trees, but there are other things I would like to learn about maple sugar making: First, how long will tin pails last, with good care, for catching sap only? I have always, since the days of troughs, used wooden pails and believe them not what is wanted—too much work to clean them on putting them up and out, and moreover they are liable to fill up with sweet that will sour and hurt the sap with the best of care—am I right or wrong? Are our common sheet-iron pans the best for boiling the sap in, considering cost? How do the galvanized iron last, and is the metal free from all poisonous substances? Let those posted, answer, that we may make this most delicious sweet as pure as possible.

New London, Ohio. B. P.

GETTING RID OF ARTICHOKES.

I NOTICE in Answers to Correspondents, March 23d, you say artichokes once established are troublesome to get rid of. There is nothing easier to eradicate than artichokes, if you try the right way, which is to cut off the tops when they are two feet high—some people who have used tops for fodder have learned this fact when they least intended it. Keep the tops of any plant cut in and the roots must die, as certainly as a man without lungs. L. A. R.

[KILLING plants by cutting off the tops is a pleasant sort of theory, and as a rule efficacious, but there are hundreds of plants that are not appreciably harmed thereby. Their stems take the place of leaves, generate chlorophyll and elaborate sap. Artichokes may be eradicated as our correspondent states, especially if growing in poor, sandy, bottomless soils. But, as a rule, we think it fair to say, even by the decapitating process, that "Artichokes are troublesome to get rid of," when once established.—EDS.]

Dairy Husbandry.

AN EXHIBITION OF DAIRY PRODUCTS.

J. M. PETERS.

THE project to repeat this year, at the East, the National Dairy Fair, which was held at Chicago last December is one which should commend itself to the dairymen of the State, and should secure from them a stronger support than they accorded either to the Philadelphia Centennial Exhibition or to the one at Chicago. The usefulness of conventions is pretty generally admitted, and our more enterprising and progressive dairymen find profit in visiting the meetings held in other counties than their own and even in other States. The West and Canada learned the rudiments and much of their proficiency in dairying from New York State, and it must be admitted that the pupils are now in a position to give some valuable hints to their teachers. The plan of holding the American Dairymen's Association Convention at Cleveland, this year, was intended to afford the East and West an opportunity of meeting on central ground, and if the object was not as successful as it should have been, it proved an entering wedge for wider intercourse in the future. Now that the Western men propose to bring their products East next October to exhibit in competition with the goods of this section, it is to be hoped that their enterprise will meet the hearty co-operation of all Eastern producers, and that the latter will be represented by such a display of their best goods that their Western competitors will not carry off the laurels, as they have heretofore done, for either the extent or excellence of their exhibits.

The place at which the Fair is to be held, is not yet decided, but the choice probably lies between New York City and Utica. There should be no question, I think, as to which place should be selected. Utica, as the center of an important dairying section of New York State, and as a large interior market, is all very well for the meeting of dairy associations in which consumers are not at all interested, and which are not very largely attended by merchants, but for an exhibition of the dairy products of all the States, and it is to be hoped of Canada and European Dairying Conventions as well, New York is by long odds, the better point. The Rink, at 63d street and Third Avenue, where the exhibitions of the American Institute are held would be an admirable place for an exhibition of butter and cheese, and such a fair as is proposed to be held would certainly attract the attention of a larger number of consumers here than could possibly be reached at Utica. This would be a most desirable result, and would add materially to the value of the exhibition, which should be not only a competitive display of the products of different sections of this and other countries, for the benefit of producers, but should also be an advertisement of dairy products such as they have never before received. It is an unfortunate fact that the majority of people in large cities know very little about the best American butter and cheese, and if a chance were offered them to learn the highest standard set up by dairymen themselves, it would doubtless be very largely improved. Visitors and exhibitors from out-of-town can find accommodation in New York as cheaply as they can at Utica or any other interior city, and the slight additional expense of railroad fare which would fall upon a few who reside near the latter place, would be more than compensated for by the increased benefits to the dairying interest from having the display in the commercial metropolis, and should be willingly incurred. This city being, also, neutral ground, so to speak, would be likely to attract a fuller exhibit than could be obtained at Utica from which local jealousies might keep many who would be willing to meet the dairymen of Herkimer away from home.

An effort should be made to obtain samples of English and Irish cheese as well as of other foreign dairy products for comparison with our own. This could be easily accomplished through some of the English shipping houses here, and it would form an attractive feature of the exhibition.

BUTTER COLOR.—I have read several articles in the RURAL on butter-coloring. For the benefit of the RURAL readers, I would like to give them my experience in the matter. All butter-makers know that there is a time in the summer and winter seasons when they cannot make handsome yellow butter of the natural color. I know that if they would use Wells and Richardson's Perfect Butter Color, they need not have any poor, white, unsalable butter. It gives a natural yellow and a good flavor without any extra work in using it, and the butter will not become streaked or lose its flavor by being packed in the usual way for any length of time. I wash the buttermilk out of the butter with cold water, then put in the salt. I then turn the color on the salt and work it all in together. Let it set over night, work over thoroughly, and you will have beautiful yellow butter that any good housewife need not be ashamed of. I can recommend it to all as being just what it is represented to be, and after you have tried it on one churning of white butter, you will not want to be without it. [Our correspondent refers, probably, to the color made by WELLS, RICHARDSON & Co., Burlington, Vt.]

A. D. RICHARDSON.

Washington Co., N. Y.

ABORTION IN CATTLE has been exciting a good deal of attention and discussion of late in England, and among the causes of the mishap one of the most common in some districts is found to be the presence of ergot on rye and several other grasses either on pasture or meadow lands, for the pest is equally injurious either on grass or hay. The specific action of ergot on the womb has long been known to medical men who have often employed it with beneficial results. In addition to its tendency to produce abortion, it is also a frequent cause of gangrene as well as of several minor derangements of health.

A METHOD OF IMPROVING rancid butter and restoring it almost to its original excellence, long ago mentioned in the RURAL, has at length found its way into German agricultural papers. However well butter may be washed and worked a small portion of casein is retained, the decomposition of which is accompanied with the formation of butyric acid which is the cause of the unpleasant taste and smell known as rancidity. This butyric acid is readily soluble in fresh milk, and hence the rancidity it produces can be easily got rid of by kneading well the tainted butter in fresh milk, and then washing it thoroughly in cold water to which a little salt has been added.

The Poultry Yard.

BROWN AND WHITE LEGHORNS.

HENRY HALES.

ALTHOUGH both these varieties of fowls are called Leghorns, they differ in some essentials. After keeping the two varieties under the same treatment as near as could be done, to test their comparative merits, from my own observations I have come to some conclusions which may be interesting to RURAL readers.

The White, no doubt, originally came from Europe, but their original color and form have been so transformed that they vary very much from the type now found in Spain, or Mediterranean countries. Climate and breeding have worked a great change in them; so much so, that in England they are considered an American rather than a European breed. Tuscany seems to lay no claim to them—we will. They are as much an American breed as the Plymouth Rock with its Cochin back, tail, and comb. Yet in the prize-lists of our poultry shows, Leghorns are classed with Spanish, while Plymouth Rocks and Dominiques are the only two varieties claimed as American breeds. The large eggs laid by these hens make them a favorite standby on the farm. Nothing pleases the farmer's wife more than to bring in a basketful of large, clear white eggs.

The Brown Leghorn is much nearer its original European type. I have seen imported birds very similar to the usually accepted type of our show birds; but woe to the pains of those who breed from them with the idea of improving their stock by such imported birds! As far as color is concerned, they breed off to all kinds of splashes and mottles, and their combs are very variable; one lot I know of, have cup-shaped combs, almost, making a crown on their heads. They did not breed true to color; but they were a fine lot of strong, heavy, prolific hens. The fancy demands dark-hackled birds, but I have noticed finer, larger specimens with hackles rather light.

Now for the comparison between the Brown and White: the Brown lays at an earlier age than the White or any other breed, lays rather smaller eggs, also lays the most eggs, according to my experience; but taking weight of eggs for a given number of hens for a considerable time, the advantage would then rest with the White. But the greatest drawback to the Browns is a disposition of the cocks to fight; partaking of the color of their original progenitors, the wild game (*Gallus Bankiva*), they naturally share some of their traits. Even when they have many hens around them, they will fight, while the White are much more docile under the same circumstances. As to hardiness, the Brown chicks are the strongest, but I do not think they maintain stronger constitutions when grown up; some of the Brown will sit.

POULTRY NOTES.

M. E. PRINCE.

DEATH TO THE POTATO BEETLE.

THE plan for destroying the potato beetle by the use of Guinea fowls, proposed by that neighbor of Col. CURTIS, as stated by the latter in the RURAL of January 12th, brings to my mind a little experience of my own in that line. When first the "bugs" made their appearance in Northern Pennsylvania, I was breeding several varieties of fancy poultry mostly in confinement, and among others Sebright Bantams, whose coop was just at one side of the patch of Early Rose. When the vines were nearly ready to bloom the beetles made their appearance in strong numbers and our hopes of early potatoes were dismal. We knew of only two modes of relief, namely: hand-picking which we had not the time to attend to, and an application of Paris-green, but this was thought to be unsafe so near the house where the children were wont to play and it was also feared that the poultry might get a taste of this deadly poison. A friend said, "Turn out the Bantams" which we accordingly did, though without faith, as we had read that no member of the feathered or any other tribe could be induced to touch the ravagers. What was our surprise to see the little beauties march directly among the potatoes and greedily devour the insects as

fast as they were found! Neither were they satisfied with one meal but continued the good work until not a beetle was left, and we harvested a fine crop. Now the secret was this: the Bantams had been a long time in confinement with but little animal food, and no doubt their appetites were particularly sharp for food of that nature and the Colorado beetle being the first they found, were tried and found to be satisfactory. Thus a taste was formed, the warfare continued and our potatoes were saved. I believe that, unless some similar plan is adopted in order to educate the Guineas to the work, the disappointment to follow will be almost certain.

GORDON SPANGLED SEBRIGHT BANTAMS.

In these days of "big things" our small breeds of stock seem to be neglected and falling into disrepute. Especially does this seem to be the case with poultry. I have never bred but two of the many varieties of Bantams and one of them a long time ago, I will therefore write of the Golden Spangled Sebrights only. Visitors, when viewing them at home or on exhibition, say, "Yes, very pretty, but what are they good for? I always reply, "I have bred many kinds of pure, grade and cross-bred fowls but none that paid me so high a price for the food and care they received as these same little birds." The Black Spanish and Houdans are remarkable for the size of their eggs, still the Sebrights give larger eggs in proportion to their size than any other breed with which I have become acquainted. Moreover, under the present mode of buying and selling by count, if produced for market the price received for these eggs is the same as that for any others. The birds can be allowed the range of the garden and lawn, where they are very useful insect destroyers, doing but little damage as compared with a twelve-pound Brahma which scatters a hill of potatoes with one or two strokes of its great clumsy foot or devours the largest head of cabbage at one *sitting*. I am ready to admit that for the table, some other breeds are preferable, but for clear profit in eggs, at large to range where they please, or in a close coop, these Spangled Sebright Bantams are surpassed by none. I could give more reasons for preference, but perhaps this article is large enough for so small a subject. I will therefore desist until our *savants* have settled the Brahma question which is now before the RURAL readers.

Sheep Husbandry.

A SMALL GRAIN RATION FOR SHEEP.

E. W. STEWART.

THE American farmer seems to think the necessity for grain feeding of sheep or other stock a calamity. He imagines that grain is a more expensive food and must, as compared with hay, always be fed at a loss. This opinion, as I have said, is based upon imagination, and not upon analysis or experiment. The opinion has grown up from the habit by farmers of raising grain for sale, and hay and other fodder for home consumption. They suppose it more profitable to sell the grain because it brings more per ton, and many times more per bulk. But let us see how the grasses, commonly used, compare with grains:

HAY.	Water.	Albuminoids.	Carbohydrates.	Crude fiber.	Fat.	Ash.
Meadow Hay	14.3	8.2	41.3	30.0	2.0	6.2
Aftermath	14.3	9.5	45.7	24.0	2.4	6.5
Red Clover	16.7	13.4	29.9	35.8	3.2	6.2
Timothy (Phleum pratense)	14.3	9.7	48.8	22.7	3.0	4.5
Orchard Grass	14.3	11.6	40.7	28.9	2.7	4.6
Blue Grass (Poa pratensis)	16.14	8.2	38.2	30.0	2.8	4.8
Average of the six	15.00	10.0	40.2	28.5	2.7	5.4

These analyses show hay in its best state, except Red Clover, which sometimes shows a greater proportion of albuminoides. They were made by Drs. WOLFF and VOELCKER. Now let us examine the various grains usually sold from the farm, under the belief that they are worth more to sell than to feed:

GRAINS.	Water.	Albuminoids.	Carbohydrates.	Crude fiber.	Fat.	Ash.
Rye	14.3	11.0	61.2	3.5	2.0	2.0
Barley	14.3	9.5	66.6	7.0	2.5	2.6
Indian Corn	14.3	10.0	56.9	10.3	6.0	3.0
Millet	14.4	10.0	68.0	5.5	7.0	2.1
Buckwheat	14.0	14.5	62.1	6.4	3.0	3.0
Peas	14.0	9.0	59.0	15.0	2.5	3.4
Flax-seed	14.3	22.4	52.3	9.2	2.5	3.5
Oil cake	12.3	20.5	35.1	7.2	37.1	5.0
Wheat Bran	13.1	16.0	48.0	17.8	3.8	5.1
Average of all	13.6	15.7	58.6	9.2	7.6	3.6

We give flax-seed, which perhaps is raised only over narrow belts of land, and is very little known, practically, as a feeding grain, but it is a most excellent addition, in very small quantity, to the rations of wethers and dry ewes, and for ewes after lambing, as it is a very fattening food and keeps the stomach and bowels in as good health as grass. It is not safe to feed flax-seed to ewes in lamb, but a little oil-meal may be safely given.

Now, if we compare the four grains most raised,—rye, barley, oats and corn,—we find the albuminoids to average 11.4 per cent., carbohydrates 65 per cent., fat 4.4 per cent.; while the average of hay is 10 per cent. albuminoids, 40 per cent. carbohydrates, 2.7 per cent. fat. This would make those four grains worth for feeding 53 per cent. more than hay; but when we consider that the nutriment in these grains is more digestible, that it is contained in so much smaller bulk, and may be taken in addition to the bulky food and produce so much more rapid growth, it is safe to say that a pound of grain is worth 75 per cent. more than a pound of good hay. And hay usually brings, in all our Eastern markets, three-fourths the price of grain per pound. The great mistake made by farmers is that they do not often enough combine grain with hay and other fodder in feeding sheep. During the cold season sheep can only digest about hay enough to keep up animal heat and supply waste. Where, then, are the growth and fleece to come from? The principal profit generally comes from the wool, and a bountiful fleece can only grow upon a sheep in fine condition. Young sheep must also make a good growth of body besides growing the wool, and if this growth is not made there will not be a profitable fleece. If farmers would but consider the fact that the principal cost of keeping sheep is in keeping them alive, without growth, and that the extra food which produces the growth and the fleece is but small, they would not withhold this small amount of grain which would give them a liberal profit. All the profit comes from the extra food.

The Swine-Herd.

DOES IT PAY TO SELL BONE.?

FEW farmers take into consideration the weight of bone, when deciding whether to raise large or small breeds of swine. Yet there is no element of a virgin soil so completely exhausted from what we call worn-out lands, as is the bone forming material, neither is there an element so difficult to restore. In the face of the fact that the continual drain of bone material from the soil, is slowly but steadily telling upon its productiveness, we must: First, make the demands upon the soil for bone material as small as possible. Second, restore all the fertilizers of this nature that are available. In order to lighten the demands upon the soil, I would advise breeding with two points constantly in view: First, small bone of fine texture, such as that found in Berkshire, Essex, Jersey Red, and some other breeds: Second, early maturity. These points must of course be in addition to those all good breeders endeavor to obtain. Small breeds have the reputation among some breeders and shippers, of breaking down and becoming helpless when fat. This is because the small breeds put on flesh more rapidly when young, and carry much more flesh in proportion to the weight of bone, than larger, slower-maturing breeds. Every farmer knows that when following the sow with slops and grass, pigs can be made to weigh from one hundred and fifty to two hundred pounds, with but little corn, by good management. My experience is, that the limit of profitable feeding is reached at about two hundred pounds weight with early-maturing breeds. It costs the feeder, at least, ten times as much to grow one pound of bone, as it does to grow the same weight of meat. The growing prejudice against the use of swine's flesh for food, would soon be removed by using the small, early-maturing breeds for family use, as with proper variety of other meats and well-fattened pig pork there could be no argument for a Christian to base prejudice on. My plan is to raise as much meat, and as little bone as I can; hurry my pigs into market at as early age as possible; and winter no hogs except my breeding sows. ENOS L. MARSH.

THAT MODEL PIGGERY.

I THINK the pig-pen illustrated and described by Mr. J. W. LANG, in the RURAL of February 16th, may well be called a "Model Piggery." My idea, in my inquiry, was to build a pen by digging down two or three feet and laying up a wall five or six feet high. Put the pen in this cellar, and have the hogs over it, and have the whole so arranged that the manure could drop into the cellar below. This would be high enough to allow a cart or sled to be backed in to draw out the manure. I think I understand Mr. LANG to say he keeps his hogs in the cellar, and again I think he doesn't. He says his pen has a shallow cellar beneath for making and saving manure, etc.: the floor and sides of each pen are firmly cemented for some three feet high; and later he says the foundation may be sunk two or three feet in the ground, the whole forming a tight, shallow cellar, the walls coming two feet above ground, (which would be five feet high.) Now, if Mr. LANG keeps his hogs in this cellar, (as I think he does, since he says he throws the manure out of the windows,) what does he mean when he says the pens are cemented some three feet upwards? Now, if I am wrong, or in other words, if the hogs are kept above the cellar, how does he get a cemented floor and wall for each pen over the cellar and how does he get the manure into it. Will Mr. LANG please explain?

L. LEHMAN.

THE PIGGERY IMPROVED.

IN your plan of a model piggery, on page 105, of date Feb. 16th, I notice in the extension, which is 26x20, more room allowed for bins than is needed. By leaving out bins 5 and 6, putting up a crane so arranged as to swing over the boiler, and thence to hanging hooks or poles, introducing a movable cleaving table, guttering the floor so as to allow the blood and water to flow outside the building, and adding some other little conveniencies that would readily suggest themselves, a convenient room for slaughtering hogs would be added to the plan. By means of the crane, hogs could be scalded, carried to the table, hung ready for dressing with none of the hard lifting so common to such labor.

I would also add a large cistern into which all the water from the building should be conducted, with a pump so provided with tubes or hose that water could be pumped into the boiler or used to cleanse the pens and floors. E. L. M.

Veterinary.

LOCKED-JAW IN HORSES.

WILL the RURAL please inform me whether locked-jaw in horses and mules can be cured, and how this disease affects the system?

Atlanta, Ga. C. D.

ANS.—Locked-jaw in horses—and the same remarks are equally applicable to the guileless mule — is frequently curable, especially if treated in the early stages. It is usually the result of some severe injury to the nervous system, the most frequent causes being, piercing the sole by "picking up" a nail or a prick in shoeing, and the operations of docking, pricking, castrating, etc. When the result of wounds, it is technically called tranmatic, when caused by disorders of the stomach, bots, and worms in the intestines or unknown causes, it is termed idiopathic. Yet another distinction—when it is confined to the head and neck it is styled trismus, but when extending to all parts of the body it is called tetanus. The usual symptoms are rigidity of certain muscles, especially of the lower jaw, completely locking the jaws together; one or both sides of the neck are rigid, the head in the former case being turned to one side, and in the latter stretched stiffly out, the nostrils dilated, the eyes retracted with the haws thrust over them, the ears erect and fixed and the countenance horror-struck; the gait is stiff and straggling, the manner of standing fixed and rigid. As the disease advances, control of the muscles throughout the body is lost, and they become stiff and rigid like those of the head and neck. The action of the pulse varies a good deal, the bowels are generally costive, and the urine often scanty. Among the best veterinarians there is a good deal of disagreement as to the most effectual methods of treatment, as each seems wedded to the mode which, in his practice, has secured favorable results. Some object to purging as tending to weaken the animal when strength is most needed, and bloodletting is now almost universally abandoned. The best results, however, have generally followed a free evacuation of the bowels as early as possible.

For this purpose a pint of castor oil and six or eight drops of croton oil should be poured down the throat by means of a syringe and tube. If the jaws are too firmly locked to admit of this, a solid aperient, such as a ball of aloes whose action is strengthened by a couple of drachms of calomel instead of the croton oil, should be introduced into the mouth; and if both of these are impracticable, copious injections, either of castor oil and turpentine, or soapsuds, should be employed. After evacuations, injections of meat broth and flour gruel may be beneficially used to strengthen and stimulate the animal. Chloroform has been highly recommended by some, as well as opium and blistering the back from the head to the tail; but the latest practice tends towards the rejection of these modes of treatment, although their use is still strongly advocated by some of the most successful practitioners. Any disturbance is extremely injurious to the afflicted animal, and he should therefore be placed apart where he may have plenty of air, little light, and no sound or visitor to disturb him. Place, where he can easily reach it, a bucket of cold, thin flour or oatmeal gruel, which should be renewed every day and kept sweet. Some of this he may be able to suck through his teeth. Whatever wounds or injuries have caused the trouble should be examined, any extraneous matter removed. If the horse has been pricked in the foot, take off the shoe; enlarge the outer orifice of the hole where the nail entered with the point of a knife, remove any foreign body, and having cleaned the part, use as a poultice: hemlock bark, lobelia and slippery elm, equal parts, moistened with boiling water, with a handful of soft-soap added. Generally when the disease terminates favorably, the change occurs on the fourth or fifth day, although there are many cases where it ran its full term of 16 days without killing the animal. In all cases, care should be taken not to suffer the starving wretch to gorge himself as soon as he may recover the use of his locked jaws.

Horticultural.

OUR NATIVE NUTS.

No. I.

C. W. IDELL.

THERE is one peculiar feature connected with our native wild fruits, which I have studied with interest, and yet have never been able to explain, that when Nature has given us one or more variety in abundance, these are the ones most likely to be neglected. Yet, I might say, with truth, that Nature has forced this fact upon us—that so far as the nut-bearing trees are concerned, their timber is among the most valuable of all the forest trees, and we plainly see how well they are adapted to the soil and climate for cultivation; still so far, we have failed to recognize this truth or take advantage of it.

All of us are aware of this one fact, that our forests are being destroyed rapidly. The nut-bearing trees are the first to be cut down, and in a few years they will become scarce and very valuable, while the nuts will disappear from our markets unless our citizens begin to cultivate these serviceable trees.

When I was a lad, there was but little demand for our native nuts outside the family that gathered them. They could not be sold at the country store, but now few such places refuse to purchase them, while the majority advertise for them. In a measure the same state of affairs existed in regard to the timber, there was but little demand for it.

With me it is questionable if any material improvement can be made in the nut of the walnut tree by cultivation, sufficient to make it popular; but I do believe that it will pay to grow the tree, for the nuts will pay all outlay of cost, and the timber is one of the most valuable and popular woods of the day, on account of its beauty and being so well adapted for ornamenting our homes. The Hickory is increasing in value yearly, and always meets with ready sale in the market. The Chestnut as a nut-bearing tree, is valuable, and the nut is susceptible of great improvement by cultivation; consequently those who are the first to begin to cultivate them will necessarily meet with success. Be that as it may, there are but few farmers in this country who cannot well afford to devote some portion of their cheap lands to this experiment, and should they even fail to improve the quality of the nut, the timber will repay them for their trouble and expense.

On looking into the history of the walnut tree, I find that several species different from ours, are grown in other countries and, in every instance, it is considered one of the most valuable trees, for every part is made use of by the inhabitants. Such was the demand for the timber by France in 1806, to make gun stocks, that 12,000 trees were required for that purpose. I find the curious fact connected with this tree in a German province, that no young farmer was permitted to marry till he had brought proof that he was the owner of a stated number of these trees.

Our native species, the Juglans nigra, is the common Black Walnut. In 1862 it was shipped to Europe for propagation, and is now thoroughly appreciated there for its good qualities. The increased demand for this wood in our country is already so great that all parts are searched for it, and even the church and door yards of our own State are invaded, and this valuable tree cut down and carted to the saw-mill to meet the demands of fashion or necessity.

The leaves are so strongly impregnated with alkali, that in foreign countries, they are sometimes gathered and burned for manure. The husks of the nuts yield a strong dye that was

formerly used by cabinet-makers to stain the light-colored woods a dark brown, and any one who has at any time hulled a quantity of the nuts, is thoroughly convinced of the lasting quality of this dye. The sap of the tree is said to contain a large percentage of saccharine matter, and in the Old World is occasionally converted into sugar, or distilled into spirits; but I know of no instance of its being in this way tested in this country. The flesh or kernel of the nut is of a dark color, largely impregnated with oil, pleasant to the taste, but still they are not as popular with consumers, as the Hickory or Chestnut, and generally sell for about fifty cents per bushel at wholesale. A bushel of these nuts is estimated to weigh fifty pounds.

The Butter-nut, Juglans cinerea, is a species of the Walnut, but is not so extensively grown. The wood, however, is even more valuable on account of its peculiar beauty, and is used chiefly by cabinet-makers. The bark possesses considerable medicinal properties, and is used in this country as a purgative. The sap contains a larger proportion of saccharine matter than the Black Walnut, and NUTTALL states that it contains as much as the Maple, and instances a case where four trees yielded, in one day, nine quarts of sap from which was made one and a quarter pounds of sugar. The fruit is oblong in shape, containing a kernel highly charged with oil, hence its name, Butter-nut, and, like butter, it will soon turn rancid on being exposed to the air. There is but a limited demand for this nut, and it never makes its appearance in the New York markets in large quantities. It generally sells from $2.00 to $3.00 per barrel.

The Hickory-nut is a native of our country, being, if I mistake not, confined to the country East of the Rocky Mountains. As a timber, it ranks next to the Walnut in value, and is used largely by carriage builders, and manufacturers of handles for edge tools, and for various other purposes. The color of the wood is quite light, except the heart, the timber is very firm in texture, susceptible of a polish, and when painted or oiled, it will resist the elements for many years. I believe the cultivation of it would improve the quality and increase the size of the nut fully fifty per cent. One can see the great difference in size and shape of the nut by examining those grown upon his own land; for while some are small, round, and rough, with thick shells, others are oblong, graceful in proportion, with a thin shell, containing a plump, rich kernel.

In our own State I know of but three varieties; the Bull, Shag or Shell-bark, and the Pig-nut. Although the kernel of the first named is sweet to the taste, the shell is very thick, and hard to crack, the kernel is removed only with difficulty. The second variety is the popular one, and the one from which I would recommend the growers to obtain their seed, as choice stock only is desirable for cultivation. The last variety is so named from the fact that, owing to their very thin shells, pigs can eat them readily, but the kernel is too small for table use.

A few days since a gentleman informed me that in 1842 he was working on a farm in New York State, and every morning for breakfast they were served with a drink called "coffee" made from Hickory-nuts, and they all liked it very much. They would crack the nuts, roast them, kernels and shells, and pour on water the same as they would for the coffee-berry, using molasses for sweetening purposes instead of sugar.

There is one feature connected with this nut that is practical and of the highest importance to those who gather them to ship to the city markets. In order to get the highest price for them, it is necessary to preserve the shells bright and clean, for any discoloration reduces their value. They should, therefore, be gathered as soon as they fall, placed under shelter in thin layers to dry, then when fit to ship, they should be thoroughly cleaned and all imperfect ones thrown out; for they are worth nothing when you ship them, add to the expense of transportation, and depreciate the value of the good ones. Now some may think this is taking too much trouble for nuts, and will say, "Oh, nonsense! shovel them in, they are good enough as they are." But just stop and think a moment. You do not notice how many bad ones you are sending off or perhaps you don't care. Remember, however, that every nut that is used, must be cracked, and each defective one is then detected and rejected, and when many are found, next time that person buys, he will refuse those among which are many imperfect ones, and take the best; consequently your imperfect or damaged nuts will not meet with ready sale.

FREEZING OF SAP IN PLANTS.

L. J. TEMPLIN.

FROM early childhood I have been familiar with facts bearing directly on this subject; having been raised principally on a farm and in close proximity to a forest where I had ample opportunity to make observations on subjects of this nature. Without any previous theory on the subject, my observations led me to the conclusion that the sap in vegetables exposed to the weather and that survive the winter, does freeze solid without in any way impairing their vitality. Nor did I dream of the existence of a different opinion till some thirteen years ago when I began to study the vegetable world in its relations to surrounding conditions, when I found that the wise ones of the world had differed very widely on this subject. This led me to scrutinize the facts more closely; and to add to my interest in this investigation I was, a few years ago, led into a discussion of this subject with Mr. THOS. MEEHAN, editor of the Gardeners' Monthly, whom I consider without a superior in the country, as a vegetable anatomist and physiologist. Differing with such men led me to doubt the correctness of my own views on the subject, so I turned to nature for a settlement of the question. The following are some of my observations and the conclusions drawn from them:

I observed that forest trees became hard frozen during very cold weather. This is proven by the fact that, on cutting into the wood, it will be found changed in its consistence and solidity from its former condition. Its resistance to cutting tools is such that in many cases it cannot be worked while in this condition. Every woodman knows this to be the case, and can tell on sticking an ax into a piece of timber whether it has been exposed to a freezing temperature long enough to be frozen, even though he were blind. To settle this matter in another way, I took a chip from a beech tree during a hard freeze and exposed a fresh surface of it under a microscope, when the frozen condition of the sap was plainly seen; and yet the tree from which it was taken, even after being wounded with the ax, survived and flourished. As to the comparative amount of sap that remains in the tree during the winter, I have never determined with care, but that it is considerable does not admit of a doubt. I have often noticed that if cions for grafting were cut and handled while frozen, they were injured, but if permitted to thaw on the tree, no injury resulted from the freezing.

Observations were also made on herbaceous plants, that proved to my mind that, in some cases, at least, they may have their sap frozen and yet survive. A cabbage plant that had failed to head, was left standing in the place where it had grown, and, though the winter was of average severity, it survived it all and grew with vigor in the spring. Many times during the winter its leaves were frozen till they were like thin plates or sheets of ice. Many times I have seen the leaves of beets and other hardy plants frozen till they would break like plates of glass, and yet not only live but grow afterwards. Turnips, radishes, onions, cabbage, etc., may be frozen as hard as our winters can freeze them, but if slightly covered with soil or other protecting material and not in any way disturbed till fully thawed out, they will often come out in the spring with their vitality apparently uninjured and their vigor undiminished. Small turnips often stand in the ground all winter and grow in the spring. If the sap in these plants does not freeze it is because either they have no sap, or it cannot be frozen by cold; neither of which propositions can be entertained for a moment by one who knows anything about the facts in the case.

Floricultural.

WILD PLANTS AS GARDEN FLOWERS.

No. I.

WILLIAM FALCONER.

THE variety and beauty of the Wild Flowers of the United States need no advocation, but it sometimes requires keen intercession to gain a place for them in our gardens, though many of them are genuinely worth the position. Yes, from the woods, meadows, and waste places of our individual neighborhoods we can exclusively furnish our gardens with trees, shrubs, and herbs, intrinsically beautiful, and able to afford us flowers from April till November. But it is not this contractedness that rivets admiration; no, we should get the choicer plants of near and distant localities, which though charming enough by themselves, are much more so when associated with welcome foreigners.

Indeed, we cannot fully appreciate our Wild Flowers till we grow them side by side with the finest foreign introductions; then our feelings warm towards home and we feel convinced that America's meadow-blossoms are just as pretty as Europe's Alpine gems. Many and lovely are the flowers of our waysides, prairies, woods and bogs; why, therefore should we be without a garden when Nature's nursery welcomes us?

The Alps and Appennines with transient glory in their floral treasure, and that garden-empire Japan, draped and clothed in evergreen, come to the aid of, but alone cannot fitly furnish the garden lots around our homes. Our native wilds teem with beautiful plants, constitutionally better fitted for home adornment than are exotics, and which with selection, perpetuation, hybridization, and extraordinary cultivation may be made to far excel their primitive condition. Indeed when seen in their natural habitats, most secondary is the beauty of many of our wildlings—bent, straggling, broken, trampled under, starved, suffocated, riddled by insects, nibbled by quadrupeds—compared with the luxuriance and perfection they attain as cared-for garden plants.

Of course, different genera or species may grow under different circumstances, but with some knowledge of their nature, and suitable conditions in our gardens, we can accommodate all. Some plants love bogs, others gravel banks, some like shady places while others glory in sunny positions; some grow on hill-tops while others prefer sheltered ravines; some grow among rocks, others in sand, some like loam, others peat, some prefer lime-stone lands while others despise such earth, and many grow in saline soils, as by the sea-shore, which would be death to many others. Notwithstanding this diversity of conditions and partialities, side by side in a little garden we can grow plants of the most divergent tastes, and that too often in the same soil.

Plants that enjoy lime or salt will grow flourishingly without them, but on the other hand, plants that dislike those substances, if brought in contact with them, may show their aversion in decline or death. It does not necessarily follow that a bog-plant must be grown in a bog; no, it may thrive amazingly in the ordinary garden border as do the Lady's Slipper, Cardinal Flower and Loosestrife; but it would be absurdity to plant Cactuses in swamps or Pickerel Weeds on dry gravel banks.

Most plants indigenous to our woods, particularly spring-bloomers, prefer shady places, while many of our summer and fall bloomers and prairie flowers enjoy an open position. Bog plants growing in spongy swamp or shallow water, often enjoy a full sun exposure, and as the sunniest portions of our gardens are usually the driest we must modify matters, by reserving a shady place for the inmates of bogs. Water plants are and will be aquatics, for, as everybody knows, it would be folly to plant Pond Lilies and Columbines in one common plot. Many persons unless they find the Wild Plants in blossom cannot determine them, whereas others can often identify the genus, and sometimes the species by the leaves or roots. It is the most certain and satisfactory method, however, where practicable and convenient, to mark by a stick, label or other means, the whereabouts of the plants, and thus leave them till the more appropriate season for transplanting them.

Soon after Spring Beauty, Smooth Lungwort, Wood Anemones, Bluets and Mandrake have bloomed, their leaves die down and the whereabouts of the plants are lost unless previously marked. Others again, as Twin-leaf, Soloman's Seal, Dicentras, and Violets, retain their leaves till frost comes, By their persistent foliage Mitrewort, Liver-leaf, Pentstemons, Helonias, Moss Pinks, Irises, and many others, can be detected at any time. As in the case of False Soloman's Seal and Indian Turnips, the "berries" mark their places when the leaves are gone. Many, as Asters and Sunflowers, are surface-rooting; the Ground Nut, has a set of chain-like tubers that run two to eight inches under ground: some Lupins, Columbines, and Monkhoods have branchy tap-roots: the bulbs of Lilium superbum bury themselves one or two feet deep in our bogs, and Solanum Torreyanum, Euphorbia corollata, and Man of the Earth Creeper send their roots deep into the earth penetrating some distance into the hard-pan or sub-soil. Fibrous and surface-rooted plants commonly transplant successfully almost at any time; but tuberous and deep-rooting ones seldom retain a ball of earth, consequently had better be transposed in spring or fall. A spade, trowel, or strong knife is convenient for digging with, and a basket, tin or wooden box or pail for carrying the roots in. Wild plants may be gathered and transposed to the garden at any practicable season during the year but preferably in fall or early spring. If done in summer, it should be after a rain, as then a goodly ball of earth and intact roots is likely to be secured, and because of the atmospheric moisture, the evaporation from the leaves will be more moderate than would be the case in dry weather.

Spring is the best time to transplant autumn-bloomers. If speedily and carefully transplanted in spring, even though plants be in flower at the time, they may go ahead blooming and growing as if nothing had happened. In fact, I have gathered Birth-roots, Blood-roots, Twin-leafs, Violets, Mandrakes, Hepaticas and others when in full bloom in April and May from all ends of the place and transplanted them, and they went along as kindly—without prematurely shedding a leaf or a petal—as if they had remained undisturbed. And what surprised myself too, the Spring Beautys I transplanted when they were in full blossom and their roots as bare of earth as Crocus corms in a seedsman's store, continued to bloom and perfect their leaves as if they had been unmoved.

Summer planting is a matter of greater uncertainty, a convenience perhaps, but can be safely practised in moist weather, say just after a rain. From lifting to setting out, the plants should be kept moist and shaded, and self-denial enough should be practised to cut off all the flower-stems. In the case of Andrew's Gentian, Bellworts, Lilies, Coreopsis and the like, the stems should only be cut over one-half or two-thirds their length. When planted, a mulching of decayed leaves or old manure placed around, or a twig of Hemlock or other Spruce or any leafy branch stuck into the ground beside, so as to lean over and shade the plants, helps them along wonderfully. In very dry weather good waterings may be beneficially given, but dribblings are worse than useless.

Fall is the best time of the year to transplant spring and early summer-flowering herbs from the woods to the garden, and the earlier it is done after the first thorough autumn rain the stronger will the plants become. They take firm hold before severe weather sets in, and if protected in winter by a thin mulching of leaves, arise in spring as bright and lovely as if they had been left undisturbed in their native wilds. Lobelias, Asters, Cone Flowers, Golden Rods, and other summer and autumn bloomers, can also be transplanted with absolute certainty in the fall.

Bad planting is a serious evil and a great source of failure. A flat-bottomed or basin-shaped hole is the common practice, and such are prejudicial, as the roots therein after planting are likely to be arranged in inverted umbrella-fashion, or the plants are often dumped in with the rootlets bent and crumpled under them like chickens under a hen, or matted on one side like a broom bent in brushing, contrary to nature and adverse to every principle of good cultivation. The soil in the bottom of the hole should be loosened with the spade, packed gently with the hand or feet, raised a little in mound-fashion, and the roots disposed on all sides with a horizontal to downward tendency, and fine earth inter-worked among them to prevent their being matted together. The planting should be firm and no deeper than was the case before.

Some Wild Plants are very easy of cultivation, in fact, many of them merely require to be once planted and they will thenceforward take care of themselves, but all are benefited and have their beauty intensified by good cultivation. The May Flower (Epigæa repens), so beautiful and plentiful in some of our woods, is extremely difficult of cultivation in our gardens, and the common Dogs-tooth Violet (Erythronium Americanum) which grows so luxuriantly and blooms so profusely in our waste places, I find grows thriftily enough but blooms sparingly as a garden flower.

Our bogs and mountains, in proportion, yield us most of our prettiest Wild Plants; indeed in a horticultural sense the Alleghanies and Rocky mountains are more to America than the Appennines, Pyrenees, and Alps are to Europe.

We have plants for almost all conditions and uses: Abronia fragrans, Phlox divaricata, and some others are sweetly scented; Evening Primroses, nocturnal; Cactuses, as Opuntia vulgaris, Rafinesquii, and Missouriensis, and Talinum teretifolum and parviflorum, Sedum pulchellum, S. ternatum, S. Telephium, and S. telephioides, for dry and stony places; and bog, pond, climbing, and annual plants in abundance. As a silvery edging plant what can be prettier than the Rocky mountain. Artemesia frigida? For the subtropical garden few subjects are more effective than young plants of the Kentucky Coffee Tree, Hercules Club, and Spikenard, with their immense and much divided leaves; some of our army of Sunflowers, notably that umbrageous and brilliantly floriferous giant, Helianthus argophyllus, and the neater, much smaller, brighter and more profuse H. cucumerifolius, both annuals of Texas. Our Hibiscuses too, Moschentos, militaris, and Californicus, will maintain a first rank for the same purpose. H. coccineus of the Southern States with its upright noble habit, and many glowing carmine ten-inch-wide blossoms can scarcely be surpassed, but unfortunately it is not hardy North; but it can be safely wintered in a cold pit.

Golden Fumitory, Pursh, and some others bloom uninterruptedly from early spring till fall. Columbines from spring welcome summer, and Blue Lobelia, Cone-flowers, Grass-of-Parnassus, Hibiscus militaris, and others from summer

step into autumn. Many species have differently colored blossoms in different plants as in the case of Lupinus polyphyllus, blue to white; Veronica Virginica, white to pink; Centaurea Americana, pale purple to very deep rich purple; Hibiscus Moscheutos, pale rose to white; and Drummond Phlox, the wildlings of which I have seen as various in hue—red, white, purple, variegated, &c., as I ever saw in Northern Gardens.

Miscellaneous.

TALKS UPON THE PRAIRIES.

The Timber Culture Act.

FRONTIER.

This act provides that any person having a homestead-right can enter an additional 160 acres of Government land upon compliance with the following conditions: That one-fourth of the land entered shall be planted to trees within four years from the date of entry, providing, however, that one-fourth of this (or ten acres) shall be planted within two years from the date of entry; another one-fourth within three years, and the balance in four years; that the trees shall not be less than twelve feet apart each way; and that they shall be cultivated and kept in a good healthy growing condition for eight years from the time of entry.

This law originated, no doubt, in a purpose to aid one of the most important enterprises that can engage the attention of our Western people. But unfortunately there are some provisions in the law that render it, to a very great degree, inoperative. Hence "Frontier" is not alone in the belief that the interests of the prairie country demand either an essential modification of this "Timber Culture Act" or its repeal. The great objection to this law is that it demands the planting of too much land to trees, and at the same time requires the planting of too small a number of trees. That is, in one direction it demands too much and in the other too little. Now the breaking of 40 acres, the planting of the same to trees, and the culture of these for eight years, will cost much more than the original 160 acres were worth without making allowance for possible losses by drought, grasshoppers and fire. Hence few will carry out the provisions of the act in good faith. Probably not one in a hundred has the means of supporting his family and fulfilling the terms of the contract, even if disposed to do so. Then trees planted twelve feet apart may answer for an orchard, but not for a forest on the plains. So the plantation will be virtually useless to the farmer if the provisions of the law are carried out. Now, if the farmer attempts to plant thickly, as a wise regard to his own interests demands, the cost, in 99 cases out of 100, will exceed the means of any planters on the frontier.

A large number of timber claims have been taken, most of them by men who knew little of the cost of tree culture, and if the Government adheres to the provisions of the law the great mass of these claims will be ultimately abandoned, at a very serious loss to a class of men who can ill afford to throw away their time and money.

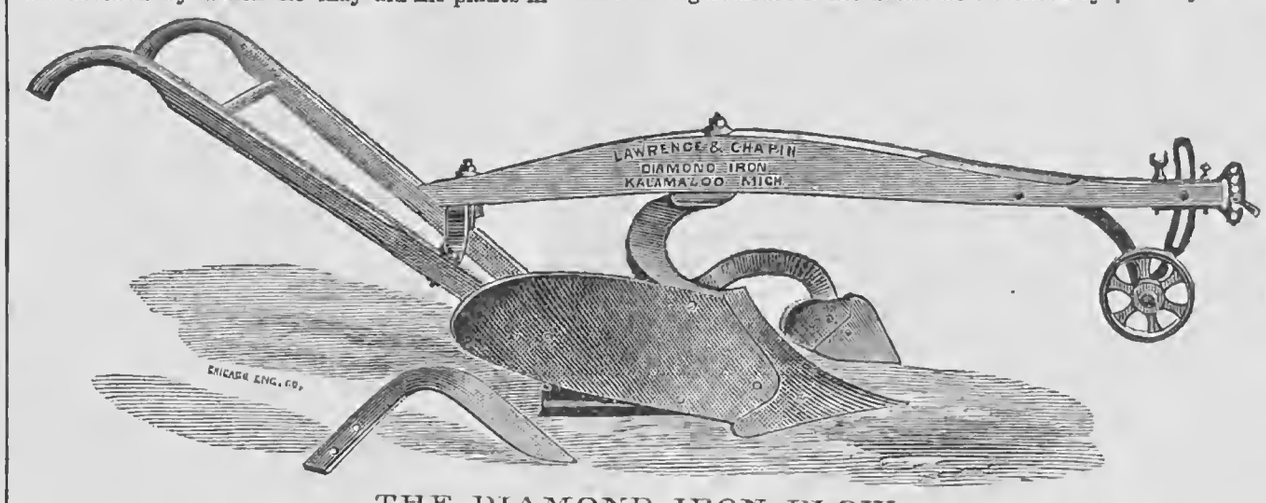
We find that 12,160 trees spread over 40 acres will answer the terms of the law, too much land and too few trees, hence the idea of a forest is lost altogether. Suppose that we could reverse this order of things, and require a much larger number of trees planted upon fewer acres, requiring at the same time that these trees should be planted with special reference to general protection, in the form of shelter-belts. Suppose that the Government had required one acre in sixteen to be planted in trees at a distance nowhere exceeding four feet by four (and better if two by four feet) in such shelter-belts as would most effectually protect the farm, thus increasing three or four-fold the number of trees and decreasing four-fold the amount of land required, the whole question of forest culture and protection for the plains would have been far nearer a settlement than it is to-day.

By such a change as this, a compliance with the provisions of the act would have been almost certain. Close planting would have secured mutual protection which is one of the essential conditions of success here. Then after the third year closely planted trees will need little further culture. By this means we should have a forest in place of an orchard growth, and at an early period an abundance of timber that would serve important purposes upon the farm. It is certain then that this whole subject of forest culture for the plains, needs careful consideration at the hands of our law-makers, and while some are proposing to repeal the existing law, it would seem to be far wiser to so modify it that it shall have a practical application to the peculiar conditions of this prairie country.

THE INFLUENCE OF AIR IN THE GROWTH OF PLANTS.

PROFESSOR LEVI STOCKBRIDGE.

Though the soil is the theater of the farmer's operations in the production of crops, yet the known fact that, on the average, ninety-five pounds in a hundred of the dry weight of our agricultural plants come either directly or indirectly from the air, and only five pounds from the soil, should lead him to diligent inquiry for the method by which he may aid his plants in



THE DIAMOND IRON PLOW.

gathering this material, or secure its active influence in developing materials needed in plant structures. To incite him to action in this direction the farmer should accept it as an axiom, that nearly all the substance of the plants of field and forest growth, are taken from the air in the form of gasses by the leaves, or by water which conveys them to the leaves, and thence to all the growing parts, and that by chemical change and combination, these gasses are changed to solid structures like the tough, hard, elastic timber of the oak or hickory.

Air is a compound of oxygen, nitrogen, carbonic acid, nitric acid, ammonia and ozone, and its office in promoting the growth of plants is: first, to furnish the organic elements of plant-food; and second, to start such chemical action in the soil as will develop and make available soil plant-food out of its mineral elements.

The soil is composed chiefly of minerals which are a chemical compound of bases with silicic acid and called silicates. The soil, or minerals, as such, do not feed the plant; but the bases and some of the mineral acids are its food when they are separated from the silicic acid which holds them, and thus made solvent in water. This decomposition of silicates, resulting in the liberation of lime, potash, magnesia, soda, phosphoric and sulphuric acids, which are actual plant-food, is the result of the action of the mixture we call air, when brought in contact with moist soil; and to this action and the methods of securing it, special attention should be given. A large proportion of our soils are a water deposit, and all of them, but especially those which contain an appreciable per cent. of clay, lime, or iron, have a tendency to become hard and solid. This tendency is much increased by the drenching and packing of heavy rains, and when broken up by the plow, they soon return to their original condition and become so compact that the air is excluded and chemical activities deadened. Chemical action, and this alone, develops the materials which cause the growth of crops, and it is the special business of the farmer, if he would secure a bountiful yield, to supply them in abundance. A very great acquisition can be made in this direction by separating the solidified soil into particles, and bringing each and all in contact with the air, and fresh volumes of air in diurnal change, by the arts of tillage.

Thus it is apparent that tillage, plowing, harrowing, crushing and pulverizing the soil, is an efficient method of supplying to crops their necessary food. And this should be the first thought when the plow, the harrow, the cultivator and the clod-crusher are used, instead of the reflection that the land is being made easier to hoe. On such soils as have been named, and to a reasonable extent, this is a cheaper way to obtain the food of plants, than in the form of yard manure or commercial fertilizers. In fact, the two last methods should never be employed, until the first has been carried to its utmost extent, or only in connection with the practice of the first. He who expends money to supply the land with manure in any form, and then neglects its tillage, does not regard good husbandry, or business principles, but expends capital without proper effort to enable it to produce paying results.

Tillage means fertility, it means increased crops, regard being had to both the soil and to manurial substances applied to it. And the farmer who most thoroughly and judiciously tills his fields will, other things being equal, secure the largest returns and the highest per cent. of profit. These thoughts and facts have a pertinence and force at this spring season of the year, when farm operations are commencing. All nature with its effective though silent forces is at the farmer's service, if he will but comply with, or prepare the way for their operation. Nature works ceaselessly, and he must not be idle. Whether his area of arable land be large or small, he can always find paying, profitable employment in cultivating his fields, not only at seed time, but during the greater portion of the period of crop growth.

MANURE EXPERIMENTS.

One of the most encouraging signs of the times in Agriculture is the desire now evinced by farmers to institute experiments for themselves to ascertain what their land needs, the outgrowth of which must prove of almost incalculable benefit. Farm manures supply to crops all the kinds of food that they need. But different plants require certain ingredients in different quantities and farm manure treats all alike. It follows therefore that by continuous cropping the soil becomes exhausted of a particular ingredient, though it may furnish all others in excess.

Now we want to find out what that ingredient is, the replacement of which would alone restore fertility to the soil. Home-made manure would accomplish this, if it could be supplied in sufficient quantity, but this would necessitate the waste of an immense amount of food with which the soil is already surfeited. Now, is it potash, phosphoric acid or nitrogen that my land needs? Ascertain this and the land which is surfeited with three of them will become at once fertile upon receiving the fourth.

At a very much less expense and trouble than most farmers suppose, each may answer this question for himself during the present season. Let him prepare as we have already several times explained, five plots 33 feet square, one-fourtieth of an acre, and together one-eight of an acre. Upon one let him spread commercial fertilizers containing the greatest percentage of potash; upon another phosphoric acid; upon another nitrogen; upon another stable dung; and leave the fifth unmanured. Then plant corn and cultivate all alike. Other plots might be advantageously added and lime, farm manure or certain combinations of the chemical fertilizers applied. A comparison of results of the yield, of course, would determine the special fertilizer which that field most needed and the next season instead of spreading over it the usual quantity of farm manure, the same effect might be produced by a very small quantity of the special fertilizer. Thousands of such experiments will be tried this summer about the country and we earnestly wish that readers of the Rural may not be behind in the benefits which, no doubt, will accrue. It is a question which each farmer must settle for himself. Then he can go to the reliable dealer and purchase the fertilizer his land needs and will no longer be obliged, as heretofore, to purchase this, that or the other for his corn because it benefits his neighbor's wheat or be influenced by the ignorant assurances of know-everything agents.

Prof. W. O. Atwater of Middletown, Conn., has developed a simple plan of experiments which will enable any farmer to ascertain with very little trouble what manurial ingredients are required for his own soil and his own crops. The pamphlets, directions for use in the field, and full particulars may be obtained free of cost by writing to the Mapes' Formula and Peruvian Guano Co., 158 Front St., New York, with whom arrangements have been made to supply all these fertilizers of guaranteed purity for the experiments under the direction of Prof. W. O. Atwater.

These are furnished free to applicants, and we suggest to our readers that they send for them and examine them fully; and also that they read with due attention whatever is calculated to enlighten them upon this important subject.

Industrial Implements.

A NEW PLOW METAL.

The amount of thought and well directed experiment devoted to the improvement of plows has simplified and improved the work of plowing to an extent that surpasses reasonable expectations even. While the form of the plow has been modified in as many different degrees, as there were colors in Joseph's coat, it is in the metal used that the greatest improvement is noted. A new combination of metals, which in their fused state have been christened "Diamond" by the founders, Messrs. Lawrence & Chapin, Kalamazoo, Mich., is a valuable improvement. Steel, wrought iron and cold-blast charcool cast-iron are fused by a process analogous to the Martin process; that is, "bodies differing in fusability are readily melted in the presence of each other, and united in a new homogeneous body." This composition, it is said, produces a very hard, fine-grained, close metal, with an average test strength of from 3000 to 3300 pounds, as indicated on a twelve inch bar of the material. Such a metal is admirably adapted for plows, as it combines lightness and strength, takes a very high polish, and does not crumble. Any practical farmer will appreciate such points of excellence.

The plow shown in the illustration is known as the "Diamond" Iron Plow, and is constructed in part of this metal. Its advantages may be briefly summed up. It is very light in actual weight of metal and light of draft, because the hardness and toughness of the iron permits of its sparing use, and its close, fine grain causes it to scour freely. The construction of the plow, aside from the metal used, is such as to give it, according to the makers, a true center draft, a good wheel, a perfect "spread round," steady running qualities; and a simple, convenient device for holding the handles.

The jointer, an important part, is, it may be seen, attached to the land-side of the plow, and is adjustable at both ends of the wrought-iron arm. This keeps it always in place, and unaffected by a change of beam. It works equally well at any depth at which the plow may be worked. The coulter being attached at the same point is subject to the same conditions, when used.

Messrs. L. & C. have added five new patterns to their already large list, and altogether the plow comes to us so highly recommended that we think it to the interest of our readers to procure fuller information concerning the implement, if they are interested in the subject of plows. Inquiries addressed as above will meet with courteous attention.

AN IMPROVEMENT IN SEWING MACHINES.

Improvements in sewing machines may be said to have begun a very short time after the first machine was made and practically tested; and they have increased and multiplied from that time. These improvements, however, were more a matter of detail than innovation, and were what an artist would call "finishing touches." It is almost proverbial that the "last" finishing touch has never been given to a picture, and the same holds good when reference is had to sewing-machines. It is so rare that it becomes noteworthy when we can make mention of an actual modification in sewing machine construction that has the effect of creating a new price of mechanism out of a familiar object. This is precisely what the Davis Vertical Feed, as applied to the Davis Sewing Machine, does. It is unnecessary to say that the "feed" is a most important part of a machine. Upon its accuracy depends regularity, strength, evenness and perfection of stitch. The vital fault has been, heretofore, that the under-ply, moving faster than the upper, because of the presser-foot holding back, while the feed is moving forward the fabric, both ends of the goods would never come out evenly, and the under-ply had, necessarily, to be pulled a trifle. Then when a strain is put upon the seam the stitches are liable to break at the gathering, or wherever the goods are more elastic than the thread. Tailors for this reason cut the under-ply longer.

It has always been, until now, a problem how to solve this difficulty, and banish the defect. An explanation of the new Vertical "feed" will, we think make this important improvement clear. This "feed" is arranged above the shuttle plate, the goods resting upon a smooth surface, and being held firmly down by the presser foot until the needle has penetrated the fabric, at which time the pressure on the fabric is being transmitted from the presser foot to the Vertical Feed-Bar, (which comes down on the goods close behind the needle,) by means of a lever connecting the two and also with the needle bar, so that at the time the needle has reached its lowest point the full pressure is transmitted to the feed-bar; and at which time the needle-bar and feed-bar are both moved, laterally, the desired length of a stitch, both moving in unison at their highest and lowest points; thus the presser-foot is always raised from the fabric when the feed takes place, thereby presenting no resistance to seams or ridges while feeding.

The needle being in the fabric, moving with the Vertical-feed with its full pressure on the goods, renders the feed sure and strong and the stitch uniform in length.

The needle being in the goods at the time the feed takes place, renders it impossible to full one piece wile the other is stretched. The Vertical feed-bar being behind the needle, renders it capable of sewing elastic goods, making a smooth and flexible seam with stitch alike on both sides, thus enabling the sewing of any number of thicknesses without basting, and operating with equal facility on the heaviest as well as the lightest fabrics.

The samples of work we have seen are really handsome and free from the objections common in machine work.

This "feed" is exclusively applied to the machines made by the Davis S. M. Company, Watertown, N. Y., who make the Davis machine. There are a number of minor improvements not found in other machines, which, altogether, go to make a sewing machine that is most desirable. Samples of work, pamphlets and information as to details will be gratuitously supplied by the company.

The Querist.

ANSWERS TO CORRESPONDENTS.

Indications of Water. Horizontal Wells.

W. L. G., Herkimer Co., N. Y., wishes to know 1. the RURAL's opinion of the use of hazel-rods for detecting veins of water. 2. Whether wells made in side-hills are likely to prove successful.

ANS.—All over this country and many other lands also, there is a large number of country folks who regard the power of detecting veins of water by means of hazel rods as a peculiar gift with which some persons are endowed; and the implicit faith these have in individuals so gifted, their frequent errors and the best arguments of others are powerless to overthrow. Yet there is no doubt but that this faith and the pretensions that give birth to it are equally nonsensical. There are, however, several indications of water which any one acquainted with the land can easily notice. These hazel-rod experts, besides having, as a rule, a good deal of personal experience in searching for water and determining the spots near which it is likely to be hit upon, are generally covertly inquisitive before deciding upon the place where the rods are to turn down over the water vein. Wherever water is accustomed to stand in winter or late in spring, where grass remains green in dry weather or late in fall, water is seldom very far off: 2. In hilly land with a clayey subsoil water is very often obtained by digging into the hillside wherever there are indications of a supply, Indeed this is often found to be the most convenient way of furnishing a constant supply of living water in pastures, and not rarely for household purposes. A spring once obtained in this way, is as good and permanent as a natural one, and many experts say that by digging horizontally in a suitable location a vein of water is more likely to be met with than by digging downwards the same distance. We have seen several very excellent springs of this kind. When water has been struck, the trench leading to it should be walled up at the head, three or four feet, like a well, and the drain leading to the outlet laid with tile or covered securely with common stone.

The Use of Soot as a Fertilizer.

L. S. Glover, Fauquier Co., Va., inquires about the worth of soot as a manure, the plants most likely to be benefited by its application, and the best method of applying it.

ANS.—Both science and experience prove that soot is a valuable fertilizer. As a top-dressing to grass its effect is excellent. On peas, asparagus, strawberries, raspberries, and indeed on nearly all growing crops the application of soot produces marked results. When sown broadcast some of the ammonia in it escapes into the atmosphere and is wasted. It should, therefore, be mixed with water, say at the rate of twelve quarts of soot to a hogshead of water, and used as a liquid manure. A mixture in the above proportion makes a very powerful fertilizer. It would be well for farmers generally to bear in mind that manures, when reduced to a liquid state before their application, yield much more readily their nutritive properties as plant-food, and are therefore most economical and efficient in their effects. It would often pay well, especially in garden cultivation, to reduce fertilizers to a liquid condition before their application.

The Christ Plant.

W. P. G.—What is your opinion of the following extract from the letter of a correspondent to a N. Y. paper. Is it not a fraud? A friend told me about "The Christ Plant" and on my declaration of disbelief, brought this slip to convince me. If there is such a thing, why wouldn't it bloom on any other as well as Christmas eve? Answer in question column and oblige.

ST. PAUL, Minn., January, 18, 1878.

MESSRS. STREET & SMITH:

Dear Sirs:—Being a constant reader of your paper for over four years, and seeing in No. 11 of the New York Weekly, your description of what you call a "Christ Plant," owned by Mr. Holtzschoider, of Philadelphia, I thought I would let you know we have had a Christ plant in our family for the past ten years. We have always heard it called, and I think correctly, a "Jericho Rose."

The one you described in your paper is precisely the same in every respect but one, and that is that it does not remain open so long. When ours is put in a tumbler of water, on Christmas Eve, about nine o'clock, it begins to open and show signs of life by eleven o'clock, and by twelve it is in full bloom. It stays so about ten minutes, when it begins to close again, and in two hours it is the same dry flower as before, with nothing to show that it ever was open. The peculiarity of it is that it only blooms at that time. If it does not, it is said it is an omen that some one will die out of the family during the year. I never was a believer in omens before, but when the rose did not open as usual a year ago last Christmas, and my uncle's wife died a short time after, I concluded that there was some truth in it, and that indeed truth was stranger than fiction.

Its origin, extends back to the time when Christ was on this earth; and many of its kind grew on the wayside when our Saviour passed through. H. G. FRIEND.

ANS.—This is an old, old story—a very little of truth and a good deal of error. The Rose of Jericho, called by botanists Anastatica hierochuntina, is a little plant five or six inches high, with branches spreading out from a central root. As soon as it blooms, the leaves fall and the branches shrivel, curling up towards the center and forming a loose ball, They are readily uprooted by the wind, growing as they do in sand and tossed hither and thither. Held by a hollow or by whatever they happen to strike, there they remain until rain. Then the dry, dead stems unfold; the seed vessels open and the seeds drop out, where in due time they germinate. The stems will close and open as often as they are dried and moistened. But the operation is purely mechanical. The monks of old invested this plant with wonderful powers and hence the people regarded it with superstitious veneration. But the fact is, it will unfold just as well, if moistened at one as another time, and *bloomed* once for all before it left its native sands.

Wire-Worms.

Sylvester Parsons, Broome Co., N. Y.—Last spring I broke three acres of sod ground and planted it to corn the 18th of May. The wire-worm commenced to eat the kernel before, or as soon as it sprouted; some never came up. I planted again with the same result. The crop proved an entire failure. The ground being very rich I used no manure. I wish to sow it to spring wheat this spring. Will the wire-worms remain in the ground? Will they injure the wheat? If so, what shall we use to prevent them? or had we better put some other crop in the ground? Please oblige by answering through RURAL.

ANS.—We presume the "wire-worms" referred to are the young of "Click-beetles" (Elateridæ), although some other insects are so called. In this case the wire-worm will remain in the ground for two or three years longer, if it can get any roots to eat. If wheat or corn is planted, it will be eaten. If the ground goes back to grass the worms will keep along on that. Either the ground must be kept broken and planted with nothing or with strong-rooted crops for two or three years, or else, if it will pay, sliced potatoes or turnips must be scattered between the hills of corn or other crop, and visited early every morning to catch the worms which will gather under the slices. We suppose wheat could not be planted economically under such conditions. It is not unusual for newly broken ground to be full of wire-worms, and some worms live in the ground five years before they are fully grown and able to fly away as beetles. As some persons have recommended sowing salt, ashes, lime and the like, we might as well say that most good authorities advise that it should not be done. We should like to have Mr. PARSONS send us ten of the wire-worms that trouble him.

That Turnip Crop.

J. W. S., Attica, O.—I would say, in answer to this correspondent of the RURAL, in issue of March 9th, that the turnip crop, described in my communication published in RURAL of Jan. 12th, was rather an informal affair. The seed sown was what I call odds and ends; that is, I gathered up the leavings of all kinds from broken packages of turnips and ruta-bagas, after former years' sowing; mixed them all together and sowed the mixture, amounting to about one and one-half or two pounds. The varieties were Strap-Leaved Red-Top, White Norfolk turnips, and perhaps some others. The seed was sown about the first of June. But I think the successful crop in this case was due more to the fresh, new soil than to the variety of seed sown. J. R.

Freedom, Wis.

Hedges.

J. N. Williams, Crawford Co., Pa., intends to construct 300 rods of road and line fence in hedge, land sandy loam, some black muck, very well drained, planted to potatoes last season, sod plowed previous fall. He asks as to the best kind, the manner of setting out, and whether it will pay.

ANS.—We have already stated that except a first desideratum be to turn stock, American Arbor-Vitæ and Red-Cedar are the best evergreen hedges in our opinion. For Crawford Co., Pa., we should choose the Osage Orange for a deciduous hedge to turn animals. To raise from seed, soak the seed in warm water for a day and retain in moist sand until sprouted, or they may be kept in sand during the winter—then sow in well prepared soil in drills made with a small plow, and cover two inches. Hoe and keep clear of weeds. Under favorable circumstances of growth they may be transplanted the next spring, having been cut well back in the fall. For setting these plants in hedge-rows, break up the ground a foot or more deep and eight or ten feet wide. The soil should be made as uniform as possible in quality and thoroughly harrowed and prepared. Draw a line through the center and plant eight inches apart. The plants (one year) can be bought for $5.00 per thousand—seeds $9 per bushel.

Miscellaneous.

T. B. C., Cornwall, N. Y.—Will the RURAL please give the names of books, with their authors and publishers, that will instruct and benefit the rural resident—treating of country life, its beauties, etc., showing the advantages and enjoyments of country town life—also how country places can be improved?

ANS.—The Art of Beautifying Suburban Home Grounds, by F. J. Scott, published by Appleton & Co.; Downing's Landscape Gardening. An enumeration of the books you indicate would fill half a column. We advise you to send for catalogues of Lee & Shepard, Lockwood, Brooks & Co. and Estes & Lauriat, Boston; G. P. Putnam's Sons and the American News Co., New York.

E. H., Hoopestown, Ill., wishes to learn (1) The average yield per acre, in pounds, of the following essential oils: Wormwood, pennyroyal, wintergreen, peppermint, mustard, tansy and thyme, with suitable soil and cultivation to produce at least an average crop. (2) Probable cost of a still for collecting the oil. (3) Whether the services of a chemist would be necessary. (4) The name of a reliable work on the subject. (5) Would such a business pay?

ANS.—(1) Some of our readers may kindly give the average yields per acre. (2) $50. (3) No, a man of ordinary education and some intelligence could manage the matter with some little practice. (4) Write to Van Nostrand, publisher, N. Y. City. (5) This would depend on so many circumstances that it would be imprudent for us to venture a prophesy.

Hattie E. Mc C., West Jersey, Ill., wishes to learn whether, as a subscriber, she is now entitled to share in the RURAL distribution of flower seeds.

ANS.—The free seed distribution for 1877 was limited to those who applied before Jan. 1st, 1878. The next distribution will be announced in the fall of this year.

Isaiah Gale, Preston, wishes to learn of a glass factory that makes pressed glass works—such as tumblers, etc.

ANS.—Whitehall, Tatum & Co., New York.

C. D. Sicklin, Saratoga Co., N. Y., inquires where he can buy a hand machine for clipping horses; also the rotary hand machine for shearing sheep.

ANS.—American Shearer Co., Nashua, N. H.

J. D. G., Meadville, Pa.—I am taking all the stumps from twenty acres of land, from which the timber was cut one year ago—soil, sandy and clay loam. (1). I wish to crop it with corn, potatoes, oats, buckwheat, and barley. Some farmers tell me, the three last crops will lodge and cause me loss, as the ground is too rich. (2). Can I raise beets, mangels and turnips successfully on soil so new?

ANS.—(1). We should try those crops on the cleared land.

(2). Yes.

NOTES FROM TEXAS.

HARRIS CO., Tex., March 8.

SPRING-TIME is in full force here. Peaches and Plums are shedding their blossoms; grape vines are pushing. Taking the average temperature of the past winter, it has been a rather cool one with prevailing rain-spells, though deprived of its usual extremes.

Vegetable gardens are in full trim. First-planted potatoes are from six to eight inches high; no beetles as yet. Corn, beans, cucumbers, melons etc., are up and growing nicely. Hardy vegetables exist in every stage of growth, from the plant in the seed-leaf to the one of full maturity. The woods are ornamented with flowering shrubs and trees, such as the Flowering Dogwood (Cornus florida), the Wild Peach or Cherry-Laurel (Prunus Caroliniana), the Virginian Fringe tree (Chionanthus Virginica), the Redbud or Judas tree (Cercis Canadensis), the Yellow Jessamine (Gelsemium sempervirens) and others.

Oranges, too, begin to show their flower-buds. There prevails at present a fever here for these much coveted trees. Many of those that stand in sheltered localities, have been, and are still, loaded with fruit. During the last six or seven years we did not have any frost severe enough to kill the trees to the ground. Now, it takes an Orange tree, when once frozen down to the roots, just about as long until its growth matures sufficiently to bear fruit again, as it would one that had been started from seed at the same time. Only one hard, olden-time frost will suffice to kill both—the trees and the mania for them—for at least half-a-dozen long years to come.

Nothing in the line of hardy flowering bulbs seems to do so well here as Hyacinths. The display they make at this time in some gardens is simply gorgeous. Far from degenerating they seem to improve from year to year, yielding in succession sometimes from two to four, or even more, racemes of flowers so thickly loaded with pips, that they need support to keep them up. It is the long season most congenial to their growth which they enjoy, that seems to produce this favorable result. If one has once a start of them, he can multiply his stock with but very little trouble or attention.

The Coco-grass (Cyperus Hydra), this pest of the Southern States, is spreading here through field and garden at a fearful rate. If it keeps on in such a way it will assuredly at last take possession of every nook and corner. It comes on in such an unassuming manner, that it takes the greatest watchfulness on the part of the cautious farmer and gardener to make on it a good, thorough onslaught at the first signs of its appearance. G. MARTI.

RURAL SPECIAL REPORTS.

DENMARK, Tuscola Co., Mich., March 13, 1878.

OUR old-fashioned winter has given us the slip this year. We have had no sleighing and no cold winter weather; but plenty of rain and mud. Frogs have been singing for over a week. Snakes and butterflies are in profusion, and worst of all, mosquitoes are so abundant as to be troublesome. Such a winter never was seen by us in Northern Michigan, and every one is wondering whether it will do to begin spring work in consideration of the "Jog to the South." Wheat looks well so far, despite unfavorable weather. Money scarce, work more so, business not very brisk. Plenty to eat, not much sickness and splendid preaching. ALPHA.

BROOKS, Waldo Co., Me.

SNOW entirely gone from open land. Traveling very bad. March has been a month of rare mildness. We have had a truly Southern winter; this has helped out the haymows. Stock doing quite well. Hens have laid all winter on account of mild weather. We are looking for a good hay and fruit crop the coming season. Hay is worth $10 to $14, pressed for market. Potatoes from 20 to 40 cents. Most of lumbering teams and crews have come out of the woods owing to roads and streams breaking up. Much lumbering has been done. More wheat and corn will be planted the coming season than for many years past. Maine is trying to raise her own bread. She can soon. J. W. L.

GALVESTON, Texas, March 11, 1878.

I DON'T remember having ever seen an "everywhere" in the RURAL from this city. Yet next to New Orleans it is in reality the chief city on the Gulf. We have now a population of 30,000, and the place, like the country back of it, is constantly receiving settlers from Europe and still more largely from all other parts of the South, while our northern accessions make up in energy and means for their smaller number. This being a business letter I must close, but will write at greater length next week. F. M. C.

RACINE, Wis.

WE have had a very open winter and plenty of mud. The roads are now drying up, and flax which is our principal product, is coming into market and bringing good prices—from $1.25 to $1.50 per bushel. Our people are feeling good, and looking forward to better times. We have every prospect of a good fruit crop; last year it was a failure. B.

WEST JERSEY, Stark Co., Ill.

WE are having very mild weather for this month—more like May than March. Fruit buds are swelling, and grass will soon do to pasture if this weather continues. There is no frost in the ground, nor has there been for the last month. H. E. McC.

WHITNEY'S POINT, N. Y., March 18, 1878.

THE weather has been very warm and spring-like during this month. Mud very deep. The last week of February and the first week of this month were good "sap weather." Maple sugar is worth about 10 cts. a pound here, and eggs 10 cents per dozen. M. B. D.

WHAT THEY SAY OF IT.

FOURTH WEEK.

THIRTY-ONE ACKNOWLEDGMENTS IN A DAY.

A GENUINE HAPPY HIT.

"HOW CAN YOU DO IT?"

A STORM OF CONGRATULATIONS.

MESSRS. PUBLISHERS — GENTLEMEN : — The "Cricket" arrived last evening. Should I express my opinion of it you would think me "gone mad" on adjectives ; so, rather than have my philological sanity called in question, I'll content me with marking my emotions! !! !!! The appreciation of the clock is not confined to myself. Thinking to ornament my store I placed the "Cricket" on a bracket, never dreaming it would be the occasion of any trouble. But my customers have all day tormented me with questions as to the price and reliability, and several have wanted to purchase it in spite of my reiterated "It's not for sale." They have been so persistent in their demands, that I momentarily expected to see one of the most valiant leap over the counter and carry it off, whether I would or not. Now, compassionate the sorrows of a poor, lone storekeeper, and tell me if you can not arrange to supply me with "Crickets" enough to satisfy the demands of the importunate natives of Mackinac. If you refuse, I cannot answer for the consequences. I doubt not but that a tragedy will be enacted as far-reaching and calamitous in its effects as the one so graphically set forth in the "Mystery of Gilgal." Dare you make yourselves responsible for such a "catastrophe?" Awaiting your reply, I subscribe myself an enthusiastic "Cricketer."

JANE H.

[We are certainly pleased to receive such evidences of the favor with which the "Cricket" is received ; but think that Mrs. H. has permitted her enthusiasm to color her endorsement of our premium. The clock is, however, creating a genuine interest wherever sent.—EDS.]

THE RURAL "Cricket," despite the tossing and agitation of a long journey, arrived here a week ago, chirping merrily, and ever since has continued to report each passing moment with admirable accuracy. "Nothing new under the sun," sighed my satiated namesake three thousand years ago ; but in the matter of novelty, his present imitator is much more fortunate, in that it is something very new indeed to find a periodical offering so handsome a premium for so trifling a service. Among the dazzling treasures of Zion's sage, none so admirable as the "Cricket" charmed the beholder. Nor was there one approaching it in value in view of the accumulation of science, skill, and ingenuity, of which this neat little time-piece is the ultimate result. Had the ancient Solomon the happy chance of securing such a masterpiece only by conferring on his friends the advantage of an introduction to the rich columns of the RURAL, his sageship would have straightway girded up his loins and started briskly out on a canvassing trip. The modern Solomon intends to do what his prototype, similarly circumstanced, would have done. SOLOMON G.

Terre Haute, Ind.

THE package came all right on Thursday the 11th. "A perfect gem." By looking at the back we discovered by the arrows around the stem-winder which way to turn the stem to wind it up ; also discovered that the bright little wheel in the center of the back regulated the hands. Having regulated and wound it up, the mystery still was, how shall we set it going? By taking the clock in the hand and turning the hand first to the right and then to the left a few times, to our joy the little thing showed unmistakable signs of life, by ticking quite loud, and it has been the admiration of all who have seen it.

Mt. Morris, N. Y. H.

THE "Cricket" came all right, and I tell you he is a lively little fellow ; but what bothers me now is, how can you afford to send such a valuable little gem as a premium for two new subscribers? When I first saw your advertisement in the paper, I told my wife I would send for one, but she said it must be a humbug.

"Humbug!" says I. "I'll risk that. I never knew the RURAL to offer anything as a premium on its paper that did not turn out all right."

Cherrytree, Penn. D. A. K.

THE little clock was received last evening. The "Cricket" was *chirping* when it was brought to me from the express office. It was not injured in any way on its journey of more than a thousand miles. The "Cricket" is a most useful ornament, and I should think every RURAL reader would want one. We would not part with ours for three times its value, if we could not get another. M. G. R.

Lyons, Iowa.

THE "Cricket" came to hand in good order. My wife says its a perfect little gem. All I will say is, that we are more than pleased with it. I think you will get more orders from this place, soon, for I have taken great pains to show the "Cricket" to every one, and they all like it. I shall send an order in a day or two for one or two more ; wishing you success, I remain yours.

MILLER'S STATION, Crawford Co. Pa. J. B. H.

I RECEIVED the "Cricket" clock in due time. It was not injured by the long journey, looks bright as a jewel, keeps good time. They are selling "Cricket" clocks in our neighborhood, but they will not compare with yours ; they are not so well finished. J. W.

Lovettsville, Va.

THE "Cricket" came to hand safe and sound, and is the admiration of the household. After a test of 36 hours I find it keeps *absolutely perfect time*. Its beauty and time-keeping qualities make it a valuable premium. WM. P. G.

104 Randolph St., Chicago.

THE "Cricket" has now honored my sitting-room mantel for several weeks, and to-day I like it better than when I first saw it. It is a beautiful little clock, a handsome ornament, and an excellent time-keeper W. F.

Cambridge, Mass.

PLEASE accept thanks ; received in fine order. We will send club of five next week, we think. Success to the paper which gives the greatest good to the highest number. MRS. J. M. W.

Klickitat Landing, W. T.

I RECEIVED the clock all right. It keeps good time and we are very much pleased with it.

Miller's Station, Pa. J. B. B.

WE are much pleased with our clock, and thank you sincerely. M. B. R.

Rochester, N. Y.

Light, Simple, Cheap.

Durable and Flexible.

Will pulverize and leave ground smoother and in better condition and cover seed better, by once going over, than twice with ordinary Harrow. Acknowledged the best in use. Being jointed in the center, it accommodates itself to uneven surfaces, such as dead furrows, ridges, &c. Made with both Chilled Metal and Cast-Steel Discs.

Responsible agents wanted where we have none. Manufactured by **WHEELER & MELICK CO., Albany, N. Y.,** for the United States, except New England States. EVERETT & SMALL, BOSTON, Mass., Manufacturers for the New England States.

THE
RURAL NEW-YORKER.
PUBLISHED EVERY SATURDAY.
Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, MARCH 30, 1878.

THE article (to be completed next week), by Mr. WILLIAM FALCONER of the Botanic Garden, Cambridge, Mass., is one of the series announced last year. It has been prepared with care and thought, and must prove instructive to those interested in "Wild Plants as Garden Flowers."

FIGURES THAT PREACH.

ST. PAUL tells us that he who while befriending others neglects those of his own household, is worse than a heathen, and until human nature has been developed to a degree of perfection far higher than it has hitherto attained, it will continue to be each man's duty to look primarily after his own interests and those of his kindred. Of the numerous responsibilities imposed on man by divine and human ordinances, it is extremely doubtful whether any one is so faithfully discharged in individual cases as this, but the obligation, in this connection that lies on a man with regard to the welfare of his immediate family, presses with only a modified weight upon him with regard to the weal of the class to which he may belong, with whose common fortune his own special interests are as a rule closely connected. Now with regard to their responsibility in this matter, the farmers of this country are marvelously remiss, especially politically. Even the simplest of them old enough to cast a vote, ought to know that the welfare of his class will be more faithfully and earnestly promoted by those who belong to it than by members of other avocations whose interests are often opposed to those of agriculture. Yet, despite the self-evident nature of this truth, farmers, year after year, persist in electing as their representatives to State and national legislatures, men belonging to other callings, notwithstanding that past neglect, broken promises and frequent indignities have shown the unfitness of such a choice. Of the 336 members composing the two houses of Congress, 239 are lawyers, 20 physicians, 19 bankers, 17 merchants, 15 editors 7 manufacturers, 5 railroad officers, and 5 school teachers, while there are only 17 farmers and planters to represent 4,000,000 agricultural voters, and the untold millions invested in farm pursuits in the greatest agricultural nation in Christendom.

FARMERS AND FRUIT GROWING.

THE lost paradise of the first man was in a garden, and naturally by the old rule we seek for happiness where it was lost. In the culture of fruits and flowers men and women come as near the original Eden as they well may. The subject is one of the greatest practical importance. How to be happy is the chief object of human endeavor. The old Roman Emperor was not so far wrong when he offered a reward to whomsoever would discover a new source of pleasure. Had not his mind and conscience been dulled by unlawful indulgences, and had he restricted his reward to joys which leave no sting behind, his philosophy would have been the hight of human wisdom, instead of being as it was, the outgrowth of beastly sensualism.

In this country pomological science has made such progress, and the practical culture of the finer fruits has become so general that it would seem as if there need be no lack. Walking up and down the streets of New York city we find such variety of luscious fruits in their season that we might infer that every family through the length and breadth of the land had an abundance. How far this is from being the fact! The great metropolis absorbs everything and has to be supplied though the rest of country suffers. It is a disgraceful fact that often the most lucious fruits are more easily obtainable in New York city than in the localities where they are or may be grown. The rural population who ought to have the most and the best of such luxuries, too often have least of all. Before we begin to talk of a glut in the fruit market let us at least make sure that the six millions of farmers and their families in these United States have an abundance of the choicest varieties in their season. The field for missionary effort in this regard is the largest and most promising that the most enthusiastic pomologist could desire.

Apples are the standard fruit whose cultivation seems to us almost universal. They can be grown everywhere but inexorable statictics prove that through the whole country less than one-half, aye, less than one-fifth of the rural population are supplied with this wholesome fruit. Of the most delicate fruits, pears, peaches, plums, cherries, grapes, strawberries, raspberries and the like, not one family in ten thousand has an adequate supply during the year. Is it not time that this disgrace should be done away with? The man who owns or tills the soil is entitled to the very best that it will produce. If not, will some one tell us who is? Times may be hard; but low prices have affected trees and plants far more seriously than they have the products which the farmer sells. The unprofitableness of ordinary farming should be a hint to diversify agriculture; to grow something else than the crops which pay so poorly. The farmer does his part in growing the food which the world requires; but let him not neglect to provide the best for his own household and self.

Possibly the high prices of fruit which prevailed years ago may not return, nor is it desirable that they should. Fruit growers who understand their business and practice what they know, are making more money than any other class of peo during the past few years. Fruit culture requires more skill and intelligence than native farming; but greater skill and more brains are what is needed everywhere. Where fruit growing is combined with farming, the latter is greatly improved, as the habits care and neatness which the cultivation of fruit necessitates make their impress on everything which the farmer does.

LOOK TO YOUR YOUNG TREES.

There are thousands of young trees, those planted in streets particularly, that are being ruined by having their stems too tightly bound, or by rubbing against the frames by which they are enclosed. The first stops the growth of the tree where it is encircled and causes an effort to grow over the obstruction, injures its appearance and strength, and the last damages it by wearing away the bark. By a few moments' attention all this difficulty can be remedied.

We do not approve staking or tying up trees when they are transplanted, except in cases when they are so large that the roots cannot be kept in proportionate size. When properly set there should be sufficient root support to hold them in position, even if to secure this the roots require fastening in their places by wooden hooks or otherwise. There are exceptional positions perhaps as, for instance, where there is protection from wind except in one direction, when a support would be beneficial.

Trees planted in streets are liable to be damaged by horses, cattle, and boys, and from these protection by frames is advisable. In such cases care should be taken to pad or cushion the frame in such a way as to prevent the rubbing of the tree so as to injure the bark. A little attention to these things will often save the tree.

NOTES.

Strawberries.—Some of our readers will be asking themselves "Shall I plant strawberries now or wait until summer or fall?" We say, plant now. This will insure a full crop for next year. If it be deferred until late in the season, a partial crop only will result next year. Select young plants which may be known by their fibrous, whitish roots, while those of old plants are longer, darker and more stringy. For home use, use manure without stint, of almost any kind. Ashes—bone-dust are excellent. But barnyard manure will suffice. Plant in rows two feet apart and eighteen inches apart in the row. Triomphe de Gand, Jucunda, Boyden 30, Charles Downing are fine varieties. Capt. Jack with us is preferable to the old Wilson. Try the Gt. American, Beauty, Pres. Lincoln. Upon a number of plants we last year tried the effect not only of a combination of all the manures at hand, but we also applied liquid manure bountifully. The result was a surprising growth of leaves such as we have never before seen in the strawberry and very large berries, but fewer than those borne by other plants not so treated.

Salsify.—Many are very decided in their praise of this vegetable and we are among them. It is not cultivated enough, and generally where it is cultivated, too little care is given to the manner of cooking it. It needs about the same management as parsnips or carrots. Sow the seed an inch deep in drills a foot apart and thin out the plants to six inches apart when two or three inches high. They may be eaten in the fall or left in the ground until spring or taken out as needed. Respecting cooking — scrape them and throw at once in water to which a little vinegar has been added. Then boil in fresh water until it has evaporated—add butter, pepper and salt, mash, form into patties and roll into cracker crumbs and fry the same as an oyster. We think those of our readers who will "try this style of cooking salsify or the vegetable oyster," as it has been well named, will ever after find a little place in the garden for its cultivation.

What Would They Have? — Ever since we can remember there has been a class who have looked upon the politics of the country as all wrong and wish the time might come when our rulers might be free from the dictation of Party. And now when we have a President, who by his action in doing after he was elected what he said he would do before; who is opposed and thwarted by nearly all of one party because he is not of their election, and by a large majority of the other, those in Congress at least, because he chooses to act as he pleases, instead of as they please, they don't seem to be a bit better satisfied. It was once thought a majority of the people would like to be emancipated from party rule; now they have a president without a party, do they rush to his support? Who is wise enough to say what the public want? Was BARNUM right in saying they delighted to be humbugged?

Japanese Progress.—On the 24th day of January last, the Mikado of Japan formally opened an Agricultural College at Komaba. The plan of the institution is largely that of our American Agricultural Colleges, with such amendments and improvements as have been suggested by the observations of government agents sent to the different European countries for that purpose. Probably no country in the world has evinced so much good sense, wisdom and liberality in discriminating between the good and bad institutions of other countries as Japan, and certainly none has made such rapid strides in the last twenty years by the adoption of foreign ideas. This system rigidly adhered to, will eventually put our celestial friends in the first rank of nations, and we are glad of it.

Chalk.—In an old agricultural paper of forty-seven years ago, we learn that it is a good plan to put a piece of chalk in the pen with the young calves. They will lick it and thus correct the acidity of their stomachs and assist digestion and prevent dyspepsia, which often leads to scours. There is no doubt but that this is a most excellent practice. Prepared chalk is often prescribed by doctors as a remedy for heart-burn which is a symptom of dyspepsia, and for diarrhea. The crude chalk (carbonate of lime) is unquestionably a good preventive and remedy for similar disorders in stock. The prepared chalk is the crude with all the gritty particles worked out.

A Seasonable Subject.—"Better late than never" is an old adage belied in the opinion of most farmers and gardeners by the tardy appearance of winter last night, driving the mercury down to 18° below freezing point to the sight and to 20° below zero to the other senses. Perhaps after all, however, it may only be the very leonine exit of a March whose entrance was truly lamblike.

BREVITIES.

NORTH of New York, do not uncover protected plants yet.

It will be observed that Domestic Economy and the Querist have changed places.

IT is stated by a contemporary that the climate of Maine is better than the world affords!!!

RURAL GROUNDS, March 25, 6 o'clock, A. M.—Thermometer 14° above zero. Green Peas up!

THE effect of soap and honey upon a bee sting is marvelous. It will make one feel glad he was stung.

THE impression seems to be general that excessive corn-feeding is the cause of what is called hog-cholera.

LEGHORN eggs average ten to eleven to a pound. Those of Light Brahmas average between six and seven.

THE Mich., Pom. Society, gives two stars to the following apples: Baldwin, Maiden's Blush, Red Astrachan, Red Canada.

DURING the rains we are having now, mark the little spots where water remains longest. In plowing or working the soil these may easily be filled in.

THE price of milk is to be reduced in some counties of this State. Is this decrease in the price of milk or an increase in the price of water?

IN purchasing plants for bedding, do not select those in bloom. We have known persons to buy Hyacinths, Japan Lilies, Ten-weeks-stock in full bloom to plant in the garden.

RACINE, Wis., will be well represented at the Paris Exhibition. Messrs. J. I. CASE & Co., have just shipped a thresher more handsomely finished than the one displayed by them at the Centennial. They have also sent a single-geared four-horse grain-heading machine. A. P. DICKEY has sent over one of his celebrated Fanning Mills made of California red-wood and finely silver-plated.

THE Germantown Telegraph thinks that strawberries are almost poisonous to some persons. The editor saw a belle at a fashionable watering place, three or four years ago, who was obliged, much to her discomfiture, to confine herself to her room for ten days from eating a plate of strawberries in the evening. But how does the editor know that the young lady was thus sickened in consequence of eating strawberries? We advise the editor rather to put his faith in strawberries than in belles.

IN transplanting remember: Dig wide holes—cut off all broken or marred roots, spread out the roots in a natural position, set the tree a little above its previous depth, fill in with good soil (no manure), work it between the roots with the hand, do not pull the tree up and down, and finally press the earth firmly down and if there is a likelihood of dry weather spread a mulch over the surface. Bear always in mind that plants are injured if their roots are exposed to sun or wind for even a few minutes.

PRES. ROOT says: "It is not National or State indebtedness, as many suppose, that necessitates our increased taxation, it is the robbery, the plundering and extravagance in all official places, from the town constable to the highest places of trust." He also says: "What then are the needs of our farmers of to-day? Plainly it is intelligence." About forty-five per-cent of the adult population of the U. S. are engaged in agricultural pursuits. Couldn't Pres. ROOT tell us what are the pressing needs of the other fifty-five per cent?

Literary Miscellany.

ONLY ONE DAY.

BY M. C. P. ASSONET.

"MAN'S work's from sun to sun;
But Woman's work is never done."
[*Old Proverb.*

THERE was a man who lived in the woods,
And this you may plainly see;
For he said he could do more work in a day
Than his wife could do in three.

"So be it," the good wife said,
"But this you must allow,—
That you will work at home to-day,
And I'll go follow the plow.

"You must milk the pretty, brown cow,
For fear she should go dry;
And you must feed the little fat pig,
That lives in yonder sty.

"You must watch the speckled hen,
Or she may lay astray;
And you must wind the bobbin of thread
That I spun yesterday."

Then the woman took the staff in hand,
And went to follow the plow;
Her husband took the shining pail,
And went to milk the cow.

Tiny she hinched, and Tiny she flinched,
And Tiny she stuck up her nose,
Then gave the old man such a kick in the face
That the blood ran down to his toes!

"Soh, Tiny! Ho, Tiny!
My pretty brown cow stand still,
If ever I try to milk you again,
'Twill be against my will!"

He went to feed the little fat pig
That lived in "yonder sty,"
And struck his head upon a beam,
Which caused his brain to fly.

He could not watch the speckled hen,
And so she laid astray;
He forgot to wind the bobbin of thread
His wife spun yesterday.

The dinner to get, the table to set,
The beds to make up smooth,
The house to sweep, the bread to knead,
"Too much for him, in truth!"

Dried apples to string, a patch to set on,
These she said nothing about.
"Enough for a week," in despair thought John,
And he was no lazy lout.

"The windows to wash, the stove to make bright
The beans to put baking for Sunday;
And all to be done before it comes night—
Too much for only one day!"

So Jonathan saw, by the light of the moon,
And the green leaves on the tree,
That his wife could do more work in a day
Than he could do in three!

[*Woman's Journal.*

OH! COUSIN CHARLEY.

MARGARET LIVINGSTON.

"COUSIN Charley's coming home!—Cousin Charley's coming home!" cried little, twelve-year-old Maud Bentley, darting breathlessly, full of the important news, into the breakfast-room. "Pa has just had a letter. I heard him telling mamma, in the dressing-room, as I went in to kiss her."

Her elder sister, Kate, who presided at the urn, changed color, and her heart began to beat fast; but she said nothing, an ommission which excited Maud's indignation.

"Why don't you say something, Sister Kate?" she cried, shaking her by the sleeve.

"Are you not glad? If I were a boy, I'd hurrah."

"I'll hurrah for you," said Master Freddy, a youngster of eight, with his mouth full of buttered toast. "I don't remember Cousin Charley, but they say he's a brick. He'll bring me, maybe, a big knife with twenty blades from New York! Jim Stanley has a stunner, that his father bought there for him. Hurrah!"

"Freddy, dear," said Kate, mildly, "don't use such slang phrases, please. Gentlemen never do."

"Just so," answered Freddy, coolly. "But, then, you see, I'm not a gentleman yet. I'm only a school-boy." And he went on stuffing himself with toast.

Notwithstanding her assumed indifference, Kate's heart was beating like a forge-hammer. Up to four years ago, when Cousin Charley had gone abroad to finish his education at a German university, Kate and he had been all in all to each other. She was, at that time, nearly sixteen, and he four years older. Charley had been, as it were, brought up in the family, for when his parents died he was only five years old, and as his father had been Mr. Bentley's, cousin, the boy had been committed to the latter's guardianship. All Charley's holidays, therefore, had been spent at the Bentley's; in winter at their town-house; in summer at their country seat. As Kate developed into girlhood, he and she became inseparable. He would have no other partner at the children's parties they attended together in town. In the country she would go out with no one else fishing, or rambling in the woods. It was one of those childish attachments at which the elders of the family smile good-naturedly, aware that they generally come to nothing. It began to look more serious, however, when, at twenty, Cousin Charley still persisted in his devotion.

"He is going abroad, however, for four years," said Mr. Bently, when his wife expressed some anxiety on the subject; "and when he comes back, he will probably have forgotten Kate. Of course there is no objection to Charley in himself. He has a good fortune, and is everything that is desirable. But Kate, at least, is too young to think of marriage."

Cousin Charley received a hint of his uncle's opinions on this subject, and went away without any formal engagment to Kate. It must be confessed she was surprised. But she remained true, nevertheless. A year after, when she began to go into society, his image still had such power over her that no one of her many suitors was able to surplant it. Thus she had reached the age of twenty, and was still unmarried. People called her cold. Even her parents thought it odd, for they had long ceased to connect her and Cousin Charley together.

But now we know why Kate's heart beat so fast on that December morning; and why, nevertheless, she assumed such an air of unconcern.

Cousin Charley, came and more than realized her maiden ideal, for he was still as merry and kind-hearted as of old, with the most distinguished manners superadded. But alas! for poor Kate, there was no renewal of the old intimacy. At their first interview she held back and Cousin Charley had little to say—in fact, seemed rather embarrassed. The secret was soon out. Kate had an old school-mate who had come that day to spend the holidays with her, a beautiful, Juno-like girl. The moment that Livia Randolph entered the room, Cousin Charley's whole manner changed. It came out that he and Livia were old friends, and had spent most of the preceding winter in Paris together. Kate was quite left out of the conversation. Nevertheless, she could not help admiring Cousin Charley's quick wit, his eloquent language, his warm enthusiasm as to all things noble and good.

"I am nobody," she said to herself, with a sigh. "He forgets the old times altogether."

As the days went on, and Christmas drew near, this conviction became more fixed. Cousin Charley came constantly to the house; but it was always with Livia he talked. There seemed a complete understanding betwen them. She was invariably in the drawing-room, awaiting his visit, and before he had been there long, she and he managed to be togother on some distant sofa, whispering. Kate could not help thinking this was rude; but her heart was sore, and she forgot that the same law cannot be applied to lovers as to others. Now and then Cousin Charley, as if recollecting his good manners, would address himself to Kate, but it was always in a stiff, constrained way; and Kate instinctively, answered in the same cold and reserved fashion.

Great preparations were being made at the Bentley's to celebrate Christmas and New Year. There was to be a dancing-party and a supper on Christmas Eve, and the dining-room was to have, suspended from a chandelier, a huge bunch of mistletoe; and woe to the pretty girl that was caught under it, for the old-fashioned penalty of a kiss would be sure to be exacted. The arrangements were superintended by Kate herself, she being practically housekeeper, her mother having been for years very much of an invalid. All day Kate was busy, going and coming. She even denied herself to callers. But Livia, as a guest, was of course free from all these cares, and sat in the drawing-room, resplendent in beauty, receiving visitors till late in the afternoon.

Just before dusk, Cousin Charley came. Kate happened to be passing through the back part of the hall, and heard him ask the footman if Miss Randolph was in. She noticed particularly that he did not inquire for her. "He knew I was to be busy," she said, "and has chosen this day on purpose: I have no doubt he is going to propose for her. Well, I wish with all my heart they may be happy." But alas! poor girl, her sigh and her woe-begone face belied her words.

About fifteen minutes later, Kate, returning from the kitchen, glanced into the back drawing-room, the door of which was just opposite the foot of the hall staircase. Livia and Cousin Charley were standing by the mantel-piece, in full sight. Cousin Charley was handing Livia a miniature, which she began immediately to kiss passionately. They were so absorbed that they did not hear Kate's footsteps, which indeed were hardy audible on the thick Axminster carpet, and in a moment she had darted up the staircase, and was out of sight.

"Oh! oh! oh!" she cried, when she had gained her own room, and locked the door behind her, and she pressed both hands on her heart, which she thought would break. Then she flung herself on the bed, face downwards, and burst into an agony of tears.

She had thought she was prepared for the blow; but she found she was not. A little hope, after all, had lingered in her heart, fed by looks that Cousin Charley gave her now and then, or that she fancied he gave. But now even this slight bit of comfort was gone. She had seen, with her own eyes, the engagement. Cousin Charley had given Livia his miniature, and the passionate way in which she kissed it showed how she loved him.

Poor Kate! We draw a veil over the next half hour. By-and-by she washed her eyes, readjusted her hair, and went back to her household duties. Then she met the family at dinner, and talked as cheerfully as if nothing had happened, and was particularly amiable to Livia, who, it was plain to see, was in the most extravagant spirits. The conversation was principally about the ball in the evening, which everybody predicted was going to be a great success.

"You must look your prettiest, to-night, Sister Kate," said the talkative Freddy, "for everybody says that you and Livia are the two handsomest girls in town; and it wouldn't do, you know, to be pretty, and not do justice to it; and a stunning dress goes a great way." And the precocious young critic nodded his head as sagaciously as Lord Burleigh, while everybody laughed.

Kate had no heart for fine clothes; but she knew it was expected of her that she should look particularly elegant; so she chose a stiff, white silk, which, with its appropriate trimmings, everybody declared made her look bewitching. She finished her toilet early, in order that she might make the tour of the rooms, to be sure that nothing was neglected. She first visited the drawing-room, and then passed on to the dining-room. Here she saw that the tables were set for the guests, and that nothing remained but to serve the supper at the proper hour.

Suddenly she heard a step behind her, and turning quickly, found herself in Cousin Charley's arms, and directly under the mistletoe. Instinctively she struggled to get free. But Cousin Charley was too strong for her. Half laughingly, yet radiant with triumph, he clasped her by the waist, held her tight and kissed her.

Kate's first feeling, on finding herself in those dear arms—shall we confess it?—was one of exquisite bliss. And if she could have lain there for ever, sure of Cousin Charley's love, she would have been perfectly content. For just one moment she gave herself up to this delicious dream. For just one moment she let Cousin Charley's heart beat against her own. Only she looked up at him, half-shyly, half-beseeching, blushing furiously, and whispered, in maidenly protest:

"Oh Cousin Charley!"

Then all at once, she remembered Livia, and the scene she had witnessed that afternoon. The whole current of her feelings was changed in an instant. With an angry gesture, she freed herself from Cousin Charley, crimsoning redder than ever, but this time with shame for herself and indignation at him.

"How dare you? How dare you?" she cried, passionately; and then breaking down she covered her face with her hands, and burst into tears.

Cousin Charley drew back frightened, and began to stroke his moustache, looking at her with wide-open eyes, the very picture of dismay and bewilderment.

"It was mean, cowardly to take agvantage of a girl, because she was weaker than yourself," she sobbed.

"But—but," stammered Cousin Charley rallying at last, "I thought it was understood that when a girl was caught under the mistletoe one had a right to kiss her. 'Pon my word, I did. I'm awfully sorry that I've offended you, Kate. I didn't mean it, I'm sure. I've been on the lookout for days for a chance to speak to you alone." Kate, in spite of her tears, opened her eyes wide. "I came early to-night, hoping to catch you before others arrived. I thought I was the happiest fellow alive, when I found you here. But I see how it is. You've hardly spoken a kind word to me since I came home. The old days are forgotten——"

"Stop!" interrupted Kate, angrier than ever, for she did not believe a word of this. She believed, on the contrary, that he was trifling with her. He had learned in Paris, she said to herself, to do these things. "Don't think you can talk to everybody, she went on, vehemently, "as you talk to Livia. Go to her, if you want"—sobbing—"if you want—kisses."

Now if Kate had been herself she would never have said this. No well-conducted young lady would. But Kate was tormented out of all self-control by jealousy and outraged maidenliness.

"Livia! What has Livia to do with it?" said Cousin Charley, more astounded than ever. "It isn't Livia I love—it is you."

His voice, as he spoke these last words, quivered with emotion and tenderness. In his eagerness he drew nearer to Kate again.

"Me?" cried Kate, moving away quickly. She could not believe it. This was only another form of insult. Was he a Grand Turk, to throw his handkerchief to everybody? "Don't touch me. I know you too well. Didn't I see you this afternoon leaning over Livia—giving her your miniature—and now you dare to speak to me in this—this way!"

"Good heavens!" cried Cousin Charley, beside himself with despair, "how you misconceive! Don't leave the room," stepping forward to intercept her. "Or only hear one word first. I thought everybody knew—you, especially—that Livia was engaged to Harry——"

"Engaged?" interrupted Kate.

"Yes, engaged to Harry Johnstone, whom I left in London. He and Livia met last winter in Paris. I brought Harry's miniature over, which he had just had painted, to give to Livia; but I mislaid it stupidly, and only found it again this morning. Confound it! I'll never do a kind action again!" And he turned away wiped his forehead, where great drops of agony had gathered.

There was silence for a moment. Then came a soft, low voice:

"And—and—you don't really love Livia?" it said. "It was all a mistake?"

"I've never loved anybody but you," answered Cousin Charley, with his face still averted; "and it's cruelly unjust to a fellow."

There was another moment of silence. Then Kate drew near, and stole a little hand into his.

"You won't be angry with me, Cousin Charley, will you?" whispered the soft, low voice.

"Angry with you!" cried Cousin Charley, turning quickly. Then he saw what made him catch her in his arms. "And you mean to say you love me? Bless you, darling! Oh! how can I thank you?"

Before the evening was half over everybody in the house knew that Kate and Cousin Charley were engaged.

CORA.

FOR the benefit of those of our subscribers who have been unable to procure the earlier chapters of "Cora" we give below a brief compendium of the story up to the present issue.

The story opens by introducing to us the heroine Cora Sinclair and her brother Harold, a young artist, who are living in comfortable circumstances on the outskirts of London.

They visit London on the occasion of a grand illumination and Cora becomes separated from her brother by the dense crowd from which she is extricated by Viscount Almane, who now comes upon the scene, and takes in the situation at a glance. Of course, this is the commencement of a very agreeable acquaintance. Lord Almane visits the Sinclair's at "The Tryst," as their cottage is called, and one day on his way thither he is thrown from his horse and carried to them with a broken arm, and remains their guest in consequence, until entirely recovered from his accident. Meanwhile the young Lord conceives a passion for the beautiful and unsophisticated Cora, and she in turn, dazzled by the handsome and graceful nobleman, gives up to him her fresh young heart without reserve. This state of affairs is divined by an old Italian servant who has long been in the family, and cherished the brother and sister as her own children—old Marianna. She confides her suspicions to Harold and he realizes for the first time the danger to which his sister has been exposed. Upon inquiry he ascertains from a friend and brother artist, that Lord Almane's character is by no means above reproach, and that he is already engaged to be married to his cousin, Lady Lucie Belmont. Young, handsome and fascinating, he has been spoiled and petted by the society of his world—he has become hard, selfish and unscrupulous, and now, his fortune being dissipated, his marriage with an heiress of his own rank his become imperatively necessary. Harold on his return congratulates Lord Almane in Cora's presence on his approaching marriage—in hopes the warning to the latter would yet be in time. Lord Almane's influence is already sufficiently potent to induce Cora to keep a midnight tryst with him to give him an apportunity to "explain," which he does by representing himself a passive victim of circumstances and his engagement to have been brought about through no volition of his, and declares his undivided love for Cora, who now, almost heart-broken, makes her way to her apartment. This conversation has been overheard by old Marianna. The following day Lord Almane leaves "The Tryst," meets his fiancee in the vortex of London fashionable society and vainly strives to exorcise the spell the artless Cora has woven around him. But his old pleasures pall on him, he becomes dull and distrait, and not accustomed at any time to deny himself the gratification of any selfish whim, he once more seeks the Sinclairs. Arrived at the Tryst he finds the "Birds flown" and the closest investigation fails to give him a clue to their whereabouts.

The story has now arrived at the point where Lord Almane upon driving Lady Lucie to visit her friend Mrs. Colston, espies at one of the windows the well-remembered features of the lost Cora.

Mrs. Colston was a handsome, good-natured woman of five and forty, highly educated, but by no means thoroughbred, and perfectly well satisfied with herself and her belongings. If she really loved any creature, it was Lady Lucie, whom she had almost entire charge of from her childhood; but her easy good nature often prompted her to do kind things which made most of her friends and acquaintances regard her as a thoroughly kind-hearted woman.

"And you are feeling as well as looking quite well, my dear?" she said, as she sat with Lucie's hand in her's.

"Oh, yes! perfectly well," replied Lucie, laughingly. "I ought to have come to see you before this, but could not find time. However, Stanley indulged me to-day."

"And I am very grateful to his lordship," said Mrs. Colston, smiling. "It is a long time since I had the pleasure of seeing you both together—quite eight years ago."

"Is it really so long?" said Lord Almane, with a smile, which belied a sigh. "Lucie must have been a wee girlie then."

"Yes, and you were a young officer, very proud of your grand uniform," answered Mrs. Colston, laughing. "I remember perfectly that I wished then that I might live to see—what I hope I shall see before very long."

Lucie blushed at the significant words; and to relieve her embarrassment, asked a question which Lord Almane was anxiously expecting:

"Have you any one staying with you, Emma? I saw a strange face, and a very pretty one, at one of the windows,"

"Yes, a young friend who is staying with me during her brother's absence abroad. I will introduce her to you, my dear. She is a pretty creature."

So saying, she rang the bell, ordered some tea, and desired the servant—a footman in most startling livery—to ask Miss Sinclair to come down.

"She is not so much a friend of ours," she explained, turning to Lucie, when the man had disappeared; "but Mr. Colston's partner, Mr. Ferrier, is intimate with her brother, and I was so pleased to have her. He was afraid of Rome for

her at this season. In fact I think it hardly safe for anyone, but he was obliged to go on business, I believe."

Very impatiently, but with all outward calm, Lord Almane awaited Cora's entrance. Twice the door opened, but it was only a servant bringing afternoon tea on a massive silver salver, served in cups painted in the brightest and most vivid colors. But as the man was leaving the room, he stepped back, holding the door open, and Cora came in with a slow, gliding step and haughtily erect head. She was looking a little pale; and in her eyes Lord Almane saw some uneasiness, and a hardly defined expression of fear, but her answer to Lady Lucie's greeting was quite composed and graceful.

Then Mrs. Colston, with no small importance, was about to present his lordship, but he interposed.

"I have had the pleasure of meeting Miss Sinclair before," he said, holding out his hand, and taking Cora's unwilling little fingers. "Indeed, I owe her and her brother a large debt of gratitude for kindness received. Lucie," he added, turning to his *fiancee*. "You were wishing one day you could know Miss Sinclair, and thank her personally. I did not dare to hope that you would so soon have the opportunity."

"I am very glad, indeed, to have it," answered Lucie, simply. "Stanley has told me of all your goodness to him, Miss Sinclair, and I hoped that some day we should become friends."

Lucie had risen, and taken Cora's hand in hers, looking eagerly into her face. Both girls were about the same hight, but there the resemblance ended. Both in face and dress they presented a perfect contrast. Lady Lucie wore a complicated and be-furbelowed dress of blue silk, while Cora's simply-made soft gray robes fell gracefully around her, and hightened the beauty of a form which needed no embellishment.

She was silent for a moment; then, lifting her eyes, met the gentle blue orbs which looked into hers, and a smile, very sweet, but very sad, came to the sweet lips. It was enough answer for Lucie; she bent forward, and touched her lips to Cora's, and from that moment the girls were friends.

"Will you give us some tea, Cora?" said Mrs. Colston; and while the girl set about her graceful task, she resumed her chit-chat with Lady Lucie, and Lord Almane was at leisure to watch the graceful, deft little hands as they moved among the gay cups and saucers, and then he moved forward to take them from her hand as soon as filled.—[To be continued.

NEW POTATIES.

T. D. SULLIVAN.

I.

Welcome to our homes once more,
Fairest gift of bounteous Erin;
Joy comes in on every floor
Upon the date of your appearin'.
Och, the poor old spuds were gone;
Black and blue they turned completely;
Out of every ten, not one
Could mortal man make use of lately.
Welcome, food for young and old,
For rich and poor for lords and ladies,
White as milk, and bright as gold,
Bursting, laughing, New Potaties.

II.

Many fruits our island yields
Above the soil, likewise below it:
Gardens, orchards, parks and fields
Are full of sweets, and well I know it;
But go praise them all who will,
I'll maintain, for that I'm able,
'Taties, sound and clean, are still
The pride and glory of the table.
Welcome, food, for young and old,
For men and babes, for lords and ladies,
White as milk and bright as gold,
Sweet and wholesome New Potaties.

III.

I'll make bowld and free to say,
Despite the way some people go on,
Bits of bread and drops of tay
Are not the things for men to grow on:
Och, 'tis quite a sartin case,
There must be matchless sustentation
In the food that feeds the race
That's plainly batin' all creation.
That's the food for young and old,
For sick and hale, for lords and ladies,
White as milk and bright as gold,
Healthful, beautiful New Potaties.

IV.

Men there are of pampered wills
Who feast on viands strange and various—
Ah, but then come draughts and pills
To cure some ills both sharp and sarious;
Not a thing with them goes wrong
Who use the simple food of Erin;
Lives are theirs serene and long,
And virtue's bright beyond comparin'
Welcome, joy of young and old,
Of rich and poor, of lords and ladies,
White as milk and bright as gold,
Grand and glorious New Potaties.

[*Dublin Nation.*

WASHINGTON LETTER.

MARY GAY ROBINSON.

Washington, D. C., March 9.

Society now goes to Congress for its entertainment. The exquisite toilettes of the ladies for hops and levees have been sorrowfully laid by for the present, and street costumes are made the most of with the touch-up of white kid-gloves, white lace veils and dress hats. In the Senate or House-galleries on pleasant days—and nearly all days are fine now—are to be seen the most fashionable ladies, their cards sent in soon bring to their sides the legislators who are their special friends, and they enjoy wit and conversation quite as much as at the evening parties when dancing is the rage.

The galleries watch the game of legislation as if it were a game of chess, but only those who have once been in the melee or are now in it, can fully understand which way the wind blows or where the ship of State is heading to. In the mens' gallery the most august visitor yesterday was Eagle Plume with his young American interpreter. At the far-off door there entered the huge blanketed figure which was at once shown to a seat. Very soon executive session drove all visitors out, but the delay, to watch Eagle Plume, made obedience to the order, "Clear the galleries" slow. The Indian Chief was bare-headed, his long straight hair hung down on each side of his broad face and a small braid fell over behind. This face in expression was placid and blank as the windowless side of a house, for out of the eyes, the soul's windows, there looked forth the spirit of a great infant that had been led thousands of miles to see the face of the White Father and the white leaders of the mighty Yankee Nation that has been swallowing up the Indian for the last few hundred years.

Eagle Plume had but a few minutes to look on the Senate to-day. That look brought wonder to his face. No doubt the statesmen appeared as strange to him as if they had been inhabitants of the moon. Ladies stopped to admire the Chief's costume, which consisted of red woolen-plaid shirt and trowsers, immense blanket, strings of wampum, silver ear-rings with many pendants that almost touched the shoulders, and moccasins handsomely embroidered with bright-colored beads. There was the making of a distinguished man, brains enough but they were dormant, strength enough but unskilled, shut out by the little gate of speech from making any communication with the crowd about him.

Eagle Plume is a Chief of the Kaw nation, in the Indian Territory. Government built for this people brick cottages in good style, but our Indian friends took off doors and windows, sold them to the nearest White people, stabled their cattle and horses in the cottages and put up the wigwam for their own abode. Civilization and its customs do not go on as easily as one might imagine: our aboriginal friends take the vices before the virtues of civilization—our least valuable habits first.

A noted writer says, "Every one takes care that his neighbor shall not cheat him; a day comes when he begins to care that he does not cheat his neighbor, then all goes well." We have not quite reached that day with the Indian, therefore we have had trouble—neither have we reached it with the Chinese, or the strikers. It is not the thing to listen to loafers who insist upon it they starve while Chinamen earn the bread they wish to earn—rioters who hinder honest workers and promote strikes. The world is wide and broad and no race of people are pushed faster upon new and unwrought fields than there is need. The best opinion on the matter seems to be to modify the treaty with China. We must not permit slavery on our shores or allow the slave owners of China to work their slaves on our land. General O. O. Howard is now in the city, just arrived from the Pacific Coast. He believes in limited immigration and tells of converted Chinamen and converted Indians that there is plenty of hope for them if Christianity will only do its duty.

Among the speeches in Congress this week, Senator Beck of Kentucky made a long one advocating the doing away with the sinking fund. Senator Beck is a large man with curling black hair and gray beard; he is the most rapid talker in the Senate, but reading his speech made him a little less rapid. He is a Scotchman by birth and in the days of slavery was Superintendent of a Southern plantation; now with Senator McCreery he is Superintendent, in a certain sense, of the whole State of Kentucky.

Another Southern Senator, Matt. W. Ransom of North Carolina, served throughout the war in the Confederate Army and was promoted to be Major-General. He was almost shot to pieces in the war and now suffers from the effects of wounds and injuries. Whenever he speaks he gets so wrought up as almost to die; he is taken into the cloak room, rubbed down and a physician sent for, and slowly he recovers from the unusual excitement. Senator Gordon of Georgia carries a deep seam in his face where he was wounded, and it is said his wife was one of the most heroic women of the South, following her husband from battle-field to battle-field, refusing to obey orders to return, declaring, "naught but death shall part thee and me."

Congressman James H. Blount of Macon, Georgia, like most of the Southern members, is a fine speaker. He is more temperate, less impassioned than a good many, does not get carried away by too much excitement. He said he wished to see, in regard to Southern interests, the spirit of fair dealing—not of war—and his whole speech was to that intent. Mr. Blount is now on his third term in Congress.

The Senate adjourned from Thursday to Monday but the House has worked six days this week. If they wasted less time filibustering they might do their work in five days at longest, but when measures do not go to suit them three hundred legislators seem to find no other resource than that one party weary the other by delay and subterfuge, so that they cannot accomplish what they are striving for. The first experience in filibustering must take by surprise a dignified clergyman just graduated into the estate of legislator—we should think he would prefer to go back to the pulpit, where his authority seems undisputed.

Every Wednesday Vinnie Ream holds her receptions in the evening, conversation and music render the hours delightful; for she has the rare tact of making every guest feel perfectly at home. Colonel Boudinet, the educated Indian half-breed, with two other gentleman, sang finely, quite eclipsing several ladies who sang opera solos; the popular ear is much better pleased with simple ballads sung by rich voices with some soul behind them, than by all the vocal gymnastics that were ever performed. Vinnie Ream sang and played upon the harp, the special grace of which consisted in her easy unaffected manner: she is more sculptor than musician. Her reception rooms were draped with dark worsted curtains that give a room a warm look in winter and serve as a most favorable back-ground for statues and works of art. As we pass out, the door into the studio is open and we are invited to come and see her at her work. Vinnie Ream's statue of Lincoln is one of the ornaments of the Capitol.

The Roman Catholics use what is called the Douay Bible. Few know why it is so called. Accounts of the edition of the Douay Bible will be found in the General Introduction to the Sacred Scriptures, by Dr. Dixon, the Catholic Archbishop of Armagh, and in Dodd's Church History of England, vol. ii. p. 121. The New Testament was published at Rheims in 1582; the Old at Doual in 1609 and 1610. The New Testament was afterwards published in a smaller form at Antwerp. In 1750, Dr. Challoner's edition of the whole Bible, with the phraseology modernised, was published in London. This is the Douay Bible generally in use among English Catholics. This edition consequently is considered the standard. The original editions of both Old and New Testaments received the approbations of the Ecclesiastical authorities and theological doctors of the Universities of Doual and Rheims, which are prefixed to all the editions.

Reviews.

RECENT LITERATURE.

Letters of John Keats. New York: Scribner, Armstrong & Co.

Who killed John Keats?
"I," says the Quarterly,
So savage and Tartarly,
"'Twas one of my feats."

But not Lord Byron's satirical rebuke to the critics, Shelley's Elegy nor Lord Houghton's Memoirs have, it seems, secured for the poet, after life's fitful fever, that immunity from discord and trouble that was denied him during his life. Now he is exhumed for a post mortem exhibition, and the editor of this volume lays bare with ruthless scalpel the heart of hearts of the Poet to the gaze of an indifferent throng, who can have no possible interest in the matter either for instruction or entertainment. Even one impelled by a morbid curiosity to learn wherein differs the love letters of a dead poet and —— his own, perhaps, shrinks with an instinctive consciousness of treading irreverently upon consecrated ground. He has before him the most sacred and tenderest emotions, the most delicate sentiments, intensified and refined by the essential elements of a poet's nature, given expression to but for one heart out of all the world—the only one of all the world capable of comprehending and appreciating his confidences, his hopes, his fears, his egotisms.

In the introduction we are told there were some facts considered too sacred for revelation. We are at a loss to conceive of what nature these facts could be. Had all the letters been suppressed, the introduction could have been published in better taste.

Bound in Honor. By J. T. Trowbridge. [Cloth, $1.00; paper, 50 cts.] Boston: Lee & Shepard.

This is one of the author's most fascinating tales for boys. It is a story of a youth with many manly and noble qualities and generous impulses who, in an evil moment, allows himself, through the influence of bad company, to become implicated in a disgraceful "scrape." A false sense of honor entails upon him many others—as is frequently the case—and he becomes a fugitive from home and friends. His adventures and experiences are entertaining and often amusing, until the prodigal returns to find his fault condoned and forgiven, and resolves to reap a rich harvest of experience from that early crop of wild oats, and to sow no more. Callow youth is naturally prone to tread the primrose path, and is more susceptible to good or bad influences than later, when contact with the world has taught him discrimination. Throw the influence of bad company into the scale with youth and exuberant spirits and health, and right and morality are apt to kick the beam, however strong in honesty and principle the individual may be.

Good Old Times, one of the same series, and uniform in binding and price, is by Rev. Elijah Kellogg, and is a stirring narrative of the struggles of the early settlers in Maine, and their adventures with Indians—their hardships and privations, and the shifts they were put to preserve their scalps intact.

Hector Servadac. By Jules Verne. [Cloth, gilt; $3.00. Illustrated.] New York: Scribner, Armstrong & Co.

The Munchausen-like audacity of the author is pronounced in this story. The reader is carried with Capt. Servadac, a young French officer on topographical duty in Algiers, near the Mediterranean coast, his orderly, a Russian count, and their friends, through a series of varied and marvelous adventures, inaugurated by a convulsion of nature which, with its consequences, none but the brain of Jules Verne could have conceived or, with any degree of plausibility, described. Throughout, so artfully—not to say scientifically is the line of demarkation concealed between the probable and the improbable—or rather between the possible and the impossible, for the author's genius spurns the limits of the merely possible—that the reader's interest and wonder go unquestioning with the characters unflaggingly to the end; while the quaint and inimitable humor which crops out, ever and anon, adds an unspeakable zest to their adventures.

We forbear giving an outline of the story, as it is replete with surprises, which to anticipate, might detract somewhat from the reader's interest, but those whose privilege it has been to read "Ten Thousand Leagues under the Sea," "A Journey from the Earth to the Moon," etc., will readily understand the characteristics of this work, and be prepared to find it equally wonderful in conception and execution.

The Devoted Bride; or, Faith and Fidelity. By St. George Tucker of Virginia. [Cloth; $1.00.] Philadelphia: T. B. Peterson & Bros.

If this title is suggestive of the Dime Novel or Yellow Back Literature, the reader will be agreeably disappointed in the work. It is a charming story, charmingly told, of the "good old colonial times." The scene is laid in Virginia, and Mr. Tucker, himself a Virginian, takes an evident pride in the characters and incidents he depicts. It is a love story, of course, the interest centering in the fortunes of the various characters during the famous Bacon insurrection of 1676. The trials of the heroine win at once our affection and sympathy for her, while we follow the hero through those stirring scenes with sustained interest to the end.

In the chapters describing the Ball at the palace of the Governor at Jamestown, at which we are introduced to the Ludwells, Berkeleys, Temples, and others of the old Cavalier stock, whose names have become identified with the early history of the Colonies, we have depicted not only the homely manners and customs of the times and country, but the happily imperfect efforts of the loyal gentlemen to reflect, in the yet unformed society of the Old Dominion, the follies and vices which disgraced the Court of Charles after the Restoration.

Home Interiors. By G. C. Gardner. With Illustrations. Boston: Jas. R. Osgood & Co.

There is no lack of books on "Interior Decoration," and it may be that some will be disposed to regard this unpretentious work as a superfluity; but our word for it, the book is a valuable contribution to the literature of Art, as applied to the household. Most books of this class address themselves almost wholly to people of means, and they of the limited income can only admire the exquisite illustrations, with no hope of ever beautifying their home in a like artistic manner. Poor folks can gather many useful suggestions from Mr. Gardner's book. In his preface he says: "I have not attempted, in these pages, to indicate a royal road to the summit of fine art in the finishing and decorating of houses, but rather to plant simple stepping-stones for those who are likely to be left somewhat behind in the headlong race for greater refinement of taste and a higher degree of æsthetic culture."

A glance at the title of the chapters will show that Mr. Gardner touches on all points which can possibly interest householders. Paper-hangings, walls, floors, blinds, wood vs. paint, wall-painting, doors and screens, casings, caps, window seats, stairways, tiles, fire-places, are each treated at length, and the final chapter is devoted to ways and means of renovating old houses, various decorations and furnishing. The author's style is chatty, and those not posted need have no fear of being confused by the frequent recurrence of art terms with which they are not familiar.

Woman's Words. An original Review of what the Sex is Doing,—published at Philadelphia, by Mrs. Juan Lewis,—deserves the generous support of the women of America. The March number contains a biographical sketch of Mrs. Clara J. Moore, the eminent author, with portrait, beside contributions from Margaret B. Harvey, Clara J. Moore, Mrs. E. C. Lewis, Helen M. Cooke, and others. The first installment of the new serial, Link by Link, The Story of a Strange Inheritance, by Col. Juan Lewis, also appears in this number.

MAGAZINES.

The Domestic Monthly and magazine contains illustrated articles on Seasonable Fabrics, Trimmings, Hosiery, Millinery, Coiffures, *Lingerie*, Fancy and Needle Work, etc. An abundance of fresh and reliable information concerning every department of fashion is provided, and the wants of ladies are judiciously consulted. They will find in it every thing they may need for guidance and instruction in supplying their needs at this season. The colored plate represents two views of a very stylish street costume.

Among the literary contents, we find another installment of Mary Cecil Hay's charming serial, "Her Three Lovers;" several entertaining sketches, entitled "Kitty's Count," and "A Story of the Transvaal;" poems by Sara Jewett, "Dorr," and others, and No. 7 in Eben E. Rexford's interesting series of "Flower Talks." The ever-enjoya-

ble Miscellany, sprightly Small Talk, instructive Household Department, elaborate reviews of new books, and not a little to the rare interest of the number, while the "Mosaics-Man" is peculiarly happy.

THE ATLANTIC for April opens with the fifth part of the romance "Detmold" by W. H. BISHOP. Of the prose contributions, a review of the works of OMAR KHAYYAM, entitled "A Persian Poet," will be found entertaining. The twelfth paper of Crude and Curious Inventions at the Centennial Exhibition treats of shoes, combs, ornaments, etc., at the Chinese, Indian, New Zealand and other exhibits, for the benefit of those who had not the good fortune to see them. "Lincoln's Triumph in 1864" a contribution from GIDEON WELLES, gives us interesting information concerning that dark period of the nation's history. A critical review of "Avis," Miss PHELPS' latest story, and of one or two other recent publications follows. RICHARD GRANT WHITE furnishes a paper on "Americanisms." "The Russians on the Bosphorus" is a timely historical sketch of the endless struggles for territory between the Slavonic races and the Turk from an early period.

"The Lobby, its Cause and Cure," is discussed by ARTHUR SEDGWICK. CHARLES DUDLEY WARNER is represented by the fourth paper of "The Adirondacks Verified." The subject "A-Hunting of the Deer" is treated in his inimitable style and from his humane point of view. Other contributions and some gems of original poetry with these make this number a peculiarly good one. Altogether the Atlantic for April will be found made up of unusually interesting matter.

ST. NICHOLAS for April is replete with good things. "Under the Lilacs" sustains its interest, while the short papers oscillate from lively to severe in unison with the temper of the month. Altogether a most attractive number.

Of the eighty cuts in Scribner for April, twenty-three are devoted to the illustration of life and sport "Among the Thousand Islands." The text of all the original sketches, and most of the wood-drawings are by Howard Pyle, George B. Prescott writes of "The Telephone and the Phonograph." The revival of "Macrame Lace" calls forth a little paper by Clarence Cook. This month's contribution to the "Occasional Papers on American Sports" is a personal narrative of "Deer-hunting on the Au Sable (Mich)," by W. M. Laffan.

"Two Saints of the Foot-hills," by Bret Harte, is said to be in his first and best manner. For people interested in the present Queen of Spain, or in convent school life in Paris, there are letters from an American schoolmate of Mercedes, entitled "A Queen at School." In her second paper in advocacy of "Twenty-six Hours a Day," Mary Blake discusses the reasons why women should cultivate habits of reading and study, and the difficulties to be overcome. C. B. Warring discusses the relations of the "Mosaic Creation and Modern Science," maintaining that there is no important discrepancy between the two. The poetry is by Maurice F. Egan, Annie R. Annan, Mary Alnge De Vere and others. "Bric-a-Brac" is given over to a piece of Irish dialect, which is already in demand for public readings—"Biddy McGlunis at the Photographer's." This number completes Volume XV. of the magazine, which is now half way through its eigth year.

HARPER'S MAGAZINE for April is an exceptionally entertaining number, and, considering the usual standard of excellence maintained by this magazine, that is high praise. Among other interesting articles may be mentioned "The American Clyde:" The Normal College of New York City (with portraits of some lovely girls); The Electric Time System; In the Heart of the Alps; The City of the Winds. All the foregoing are fully illustrated. Aunt Kerammick's Art Studies is the narrative of a lady's laughable attempts to keep abreast of the extreme and latest development in Art. The author of "Debby Ann" (a short story) does the cause of woman's advancement good service by pointing out that invalidism is not the normal condition of woman, but that it is the result of wrong dressing and wrong living. "The Perfect Canoe," with 12 illustrations, will probably attract the attention of "the boys." We quote an item or two from the article, with the hope of interesting the boys in the subject:

"Canoeing contains all the delights of yachting, and in addition many other delights of which the yachtsman knows nothing. It is the active principle of yachting set free from costly suppers, tyrannical sailing-masters, and the endless war of keel and center-board. The canoeist cruises not only on the Sound and the sand-girt bays of the Atlantic coast, but on the wild and rapid rivers of the remotest wilderness. To have lived and loved was considered by a German poet to be a very satisfactory thing, but the man who can say 'I have lived and paddled,' has alone known perfect happiness."

SUNDAY AFTERNOON.—A new "Magazine for the Household" is quite a new departure in Sunday reading. The contents comprise complete stories; serials, poems, and general articles, among which are political discussions, etc., with a more or less religious and scientific flavor, judging by the names signed to the articles. Its staff of contributors is such as to assure strong articles. We note among the writers HABBERTON, SUSAN COOLIDGE, ELIZABETH E. PHELPS, SARAH O. JEWETT, J. W. DAWSON, EDWARD ABBOTT, etc. Its price ($3.00 per year) is not too much for the class of matter published.

WERE I, O God! in churchless lands remaining,
Far from all voice of teachers or divines,
My soul would find in flowers of thy ordaining
Priests, sermons, shrines.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

THE FLOWER OF THE FIELD.

THERE grew a poppy in a plot of corn,
And three men went thereby, before the heat
Had drawn from out the field beneath their feet
The freshness of the dewdrops and the morn.
Then did the lovelines of that lone flower
Strike in upon the sense of all the three;
And one, a youth, spake in that thoughtful hour,
And said, "Methinks this poppy well might be
Some rich dark southern beauty, sleepy-sweet,
Girt with a bending ring of gracious men."
The second, one that was of riper years,
Made answer, "Nay, a blood-red banner, torn
By steel of strife, and blown by winds of war,
And guarded round by ranks of shining spears."
Then spake to them the third, whose head was hoar,—
"Death comes to love and war; what aid they then?
The flower has one speech only unto me,
That man is as the grass, and all his pride
Of war, and beauty of love shall suddenly
Fade like the flowers in the sad autumn-tide;
The wind sweeps over them, and they are gone!"
And thereupon those three went silent on,
And the low sunlight lay uncrossed by shade,
Until a maiden came, who hummed a song
For very gladness, as she tripped along,
The freshness of the morning in her eyes;
Nor was she moved as they, in any wise,
To any thought of that which makes afraid,
But stopped and plucked the poppy from the ground,
And set it on the whiteness of her dress,
And so passed on, with added loveliness,
No hidden inner meaning had she found,
Nor thought of strife or death to make her sad,—
The sole sweet beauty was enough for her;
She took God's thought, the poppy, and was glad,—
So was she nature's best interpreter.

[*Spectator.*

LETTERS FROM A COUNTRY GIRL.

MARGARET B. HARVEY.

No. 3.

IN my first letter, I said that the home began to improve; in the second, that the neighbors showed interest. Now I want to say *how* I think it will improve and in *what* they will become interested. So I shall talk a little about ornamentation. Here I am somewhat at a loss. So much has been written on this subject, so many good suggestions have been given regarding home decoration, that I fear I may be unable to suggest anything very new or valuable. But I shall simply tell what *we* did when we moved into a house which had been long neglected, and which we wanted to make as pleasant as possible. First of all, we said we must consider the place, as a *whole*, so we must think of improving it all, inside and outside. Let us see what we had to begin with. And we found we had just what *you* have, if you are the woman whom I supposed in the first letter to have made her house warm and bright and clean, and banished her gaudy ornaments and put fresh, light paper on her walls, and clean, white curtains to her windows. We had a good solid foundation upon which to rear whatever of beauty we could.

We surveyed our bare parlor. There was a pretty paper, of a soft, gray tint, with a graceful little vine, the whole lighting up to a delicate pink-shell, or a pale gold in the sunlight. Besides this, nothing noticeable, but a marble mantel and clean paint. The old carpet would not fit at all, so we had to buy new.

Just now a great deal is being said about correct and artistic ways of decorating houses after the fashion of EASTLAKE, and CLARENCE COOK, and the Misses GARRETT. We are told that the floors must be polished walnut, the carpets rich, the curtains heavy; that ceiling and walls must have their tints, and friezes and dadoes. All very well for those who can afford this style,—but as a practical woman, it is my humble opinion that if the generality of people, especially in the country, wait until they can have the approved appliances before beginning to decorate their homes, they are doomed to spend a long, weary interval of waiting amid dreary ugliness. Therefore, in giving my suggestions, I don't pretend to advance them as authority. I merely state what can be and has been done, with satisfactory results as to comfort and beauty at least, though the extreme of high art be not attained.

When we chose our carpets, we had regard to our surroundings, and our purses. For the small, simply-furnished parlor of a country-house, we did not think anything could be better than a good, small-figured, light-colored ingrain. Small-figured, to correspond with the room, and not give it the appearance of being crowded with large objects. Light-colored, because a light carpet invariably gives a cheerful air and a clear tone, and keeps its beauty longer than any other. Strange as it may sound, a dark carpet shows every spot, every thread, while it is almost impossible to make a light carpet dirty. (Ours contained a great deal of white.) And with our delicate wall-paper and carpet, simple as they were, our room appeared almost pure enough for a fairy-bower.

To correspond best with this style, light furniture is most appropriate. The dark and heavy is always out of place in the country, where all around is light, airy, and graceful. In thought of this, we purchased small, light, compact chairs, with cane seats; and it was because we knew that it is always the best economy to pay at once a little more for a good article that will last, that we were careful to select a set having oiled walnut frames, and fine, white canes, and avoid the stained, enamelled frames and open, yellow canes. This is something worth knowing. The difference may not be noticeable by the ordinary observer, but once known it is never forgotten.

We had our sofa, and organ, and marble-topped table. So the rest of our energies devoted to the parlor were spent in the little artistic touches. And on these, after all, depend the character of a room, exactly as a lady's tasteful appearance depends more on her *lingerie* ribbons, and jewels, than on her solid dress. But as we had little to spend, we knew that our ornamentation must be very simple.

First, as to the pictures: We decided that the old chromos should *not* go into the new parlor, which we girls determined to have after our own hearts. Only our own drawings, we said, should. So, in the recess, on the left of the chimney and mantel we hung "The Wild Boar," a large crayon piece, representing this animal being torn by five great dogs; on the right, "Comin' thro' the Rye," of the same size. Over the mantel-piece, a picture of PAPA'S head. On the other side of the room, opposite the chimney and over the sofa, were, highest up, the thorn-crowned head of CORREGIO'S "Ecce Homo," while on a line below, forming a triangle with it, a fruit and a flower-piece in pencil. In front, between the windows were four little pencil sketches. On each end of the mantel, leaning against the wall, two in water colors; one, a sprig of rosebuds, the other, a bunch of grasses and daisies. Twelve in all;—and besides these, our "sweet girl's graduate's" diploma hung over the organ which stood against the back wall. They were all in simple walnut frames.

Now, I have a chance to say to every woman who can draw, that you need never be at a loss to decorate your home tastefully, for drawing materials are cheap; the work and skill give the picture its value. To every one who cannot I would say, learn how right-away. If you cannot afford instruction, teach yourself a little by taking a simple landscape and copying it, line by line, shade by shade, and continue to do so until you can draw at least some little flowers and landscapes. Carefully executed drawings neatly framed, always give a room an air of refinement. Engravings, heliotypes, and photographs of celebrated paintings are beautiful. But above all things, avoid gayly-colored lithographs in staring gilt frames. First, because they are usually hideous. Second, the money might be better employed. Third, even were they all they pretended to be they would not correspond with your simple appointments. Of chromos—*real* chromos, I shall tell you more another time.

Our parlor now looked quite pretty, but not yet was it finished. On the crowning part we could afford to lay out a large proportion of our little savings, and we did. We bought eight, pretty carved brackets, each pair unlike; two pair for the corners, two for the sides. In each corner of the two recesses on each side of the chimney, we hung one; while of the others, the two large ones were placed low down on each side of the diploma; the two small were separated, one being in the base of the triangle, formed by the three pictures over the sofa, the other in the center of the rhomboid made by the four sketches between the windows. We stood in the center of the mantel, between the water-colors, an exquisite bust of Apollo, in Parian marble. On the corner brackets in the right recess, farthest from the windows, two smaller busts of MILTON and SCHILLER. On those nearest the windows, two pots of Kenilworth Ivy, the delicate green vines trailing almost to the floor. The low brackets on each side the diploma and over the organ, held two tapering glass vases inwrought with ferns, in which at one time we kept cut flowers; at another, some slips of Tradescantia which we trained to twine up around the diploma. Under the "Ecce Homo," upon one of the little brackets we had a large fan made of pressed ferns and sumac; and on the other one between the windows, a pretty rose bud vase, containing a tiny bouquet in wax. Finally, on the table which stood between the two windows we arranged our few books; on the organ, our music; embroidered a bright cover for the organ-stool, laid a soft rug before the sofa, made for its center a delicate spatter-work tidy, and wreathed around the picture cords some drooping, gray, Florida moss. The room looked simply perfect.

Before I close, I would like to express what I have often thought. Why is it that so many people spend so much and have nothing after all? Beauty does not necessarily cost much. I have marveled again and again why we do not oftener see these exquisite accessories of the beautiful among the generality of people. Once procured, they never wear out. "A thing of beauty is a joy forever." It must be because the persons in question have not taken notice. But if they will spend an hour in an art store, they will begin to understand. I will tell what the most expensive of my pretty things cost: The brackets averaged fifty cents per pair; vases one dollar per pair; the wax-work, a dollar and a-half for the little spray,—two half-blown roses nestling in leaves. The busts, one dollar and a-half a-piece for Milton, and Schiller, three dollars for the Apollo. I have seen lovely busts of Bacchus, Clytie, Lesbie, Beatrice and Diana, at prices ranging from two to four dollars.

We have lately read a great deal about purchasing plaster casts of famous statues to adorn our homes—but to me this is only another kind of sham. I would say that if you wish to beautify, get a tiny, choice bit in Parian; if to study, a fine photograph of an original; this, too, will be an ornament. Then what you have will be true to itself. This is not all we did, as I shall tell you next time.

A SHORT CHAPTER ON COUNTRY VISITING.

MRS. A. E. STORY.

GENERALLY speaking, when a country woman sees her way clear for an afternoon's release from the labors and cares which are peculiarly hers, the first thing she asks herself is: "Whom shall I visit to-day?"

Now, these interchanges of visits—these "tea drinks," as we hear a grandmother call them—are not to be condemned because some one, having weighed them in the balance, has found them wanting. They ought rather to be encouraged as affording at times the only possible escape valve for the low spirits engendered by the turmoil and weariness of every day life.

It is only the tittle-tattle, the soul-narrowing gossip over other people's affairs that is to be condemned. True, some women cannot talk at all unless it be to pick their neighbor's characters to pieces bit by bit, or rattle on in a way nonsensical enough to shame a magpie; and why really intelligent and in every way superior women should feel called upon to exchange visits with such, is a problem for the strong-minded to solve. They derive no benefit themselves from the intercourse, and they can impart none, for no lever can be brought to bear on these women's minds potent enough to lift them out of the narrow groove in which they delight to run. Anything sensible thrown in as an idea to turn the current of the talk of these rattle-brains but serves as oil to make their tongues run the faster; and the more they talk the less they say, if that is an allowable expression.

But why *must* every woman living in a country neighborhood feel bound to visit every other woman living there, and that with clock-work regularity. No skipping one here and another there for her own pleasure or convenience. And why *must* she, when her own turn to "have company" comes, make such elaborate preparations for the supper, as though she expected her friends had had nothing to eat for a week. If they come to her house merely to be fed, then, perhaps, this superabundance of food is permissible; if not, it is needless, to say the least. The average woman has a good deal to learn in this respect.

In many homes, the announcement that company is coming to tea is enough to set everything, from one end of the house to the other, in a state of commotion. Carpets must be swept that are as innocent of dirt as a new glove, furniture must be dusted where no dust is visible, stoops must be scrubbed, and the kitchen floor mopped, for Mrs. So-and-So always *will* go into the kitchen whether she is wanted there or not. Cakes and tarts, and cookies, and doughnuts, and what not must be made, and all this, perhaps for a person for whom you in reality care less than nothing, between whom and yourself there exists not the least degree of sympathy, and whose tastes and instincts are precisely what yours are not.

Life is too short and its necessities too stern and real to be frittered away in idle pursuits or profitless companionship.

Those women who are bringing up sons and daughters should, most of all, give these meddlesome nobodies a wide berth.

Children are apt to take pattern in speech and manners, and even habit of thought, from those with whom they are brought in familiar contact, and your gossips are always ignorant and superstitious in a greater or less degree, and brew mischief as naturally as storms are brewed in air.

They are not always idle ne'er-do-wells: more's the pity for humanity; they would be shunned more if they were, for idleness is to the thrifty what vice is to the virtuous, something to be avoided and guarded against as men avoid and guard against a pestilence.

You may be called "proud" and "stuck-up" if you break from the association of these people; they may even vent their dudgeon by saying worse things of you. But what of it? It will be but as the "crackling of thorns under foot," and you will gain more than you can possibly lose.

We admire the independence of spirit of a certain old lady, who said: "I take it as a high compliment to be called proud. When people mean by it that I am particular in my choice of society. I *am* proud."

THE BEWITCHED DOOR-YARDS.

J, E. M. C.

I no not know how the fairies came to be so affronted with the good house-wives of Ghoram, but they played them a very funny trick one bright May morning, a good while ago, when fairies were suffered to be more energetic than they are now-a-days.

The spring was forward that year and the good ladies had their front yards tidied up in the neatest manner. The flower beds were as neat as could be, and spikes of Pinks, and gay little Polyanthus Blossoms were beginning to peep, while the Blue Flags and Jonquils had long ago hung out their banners to the spring breeze. Each fence was whitewashed, and the gravel path swept up clean, and boilers full of boiling suds had been poured over it to kill off every weed and grass spire that might show its head among the stones. Most folks had finished their house cleaning and were settling down to take their comfort.

Yet there was something about most of the premises that did not suit the fairies. So what do you think they did one moon-shiny night when the village was wrapped in slumber? They turned the yards "hind side before." Every house-mother saw in the morning her back-yard in front of the house, and when she opened her kitchen door to throw out the dish-water, she plumped it into a posy-bed! Oh what consternation in the town! An earth-quake could not have shaken them up more! But they had no time to study over the problem. There was work to be done and that in a hurry.

"Run Mary Jane and scratch up those old tins and scraps of crockery out front, before any body goes by, and Sam make haste to slick up your wood-pile and set things a little more to rights. Look at those fence-corners! What a collection of old duds they do hold! Father, never mind the cattle, they can wait, but hurry out with your rakes, and clean up the yard. What in the world will folks think? If I had time I should wonder how it happened, but I have'nt. I remember hearing my old grandfather say that he did'nt believe the world turned around because, if it did, his wood-pile would sometimes be in front of the house. I guess the world has turned around in the night."

If there ain't an old hoop-skirt on that briar-bush just before the door, and the hens have got in to the flower beds. Dear, dear, run children every one of you and see what you can do in less than no time."

And that was the way it was all over town. Nobody liked the idea of having the old order of things reversed, however well kept they had thought the premises. Somehow things looked very different when brought to the front, for the inspection of all passers-by.

By night things were measurably reduced to a system, but the house-wives had had a busy time as the fairies the night before. The women-folks took a long breath of relief as they settled back in their straight backed rockers, and now "the wonder grew." That the town was bewitched was a pretty general belief, and some apprehension existed as to what the morning might have in store for them.

Nothing very disastrous did happen, and every body was well content when they found things in the morning returned to their former order. The world had turned around again. But their back-yards had not had such a clearing up since the time that the houses were built.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

PITHS.

— Butter-milk is drunk by many dyspeptics.

— Use carbolic acid and water to purify sinks, drains, etc.

— Make a paste of soft soap and emery for polishing steel.

— Dip candle wicks into spirits of turpentine and then dry before using.

— Old paint pails and cans may be thoroughly cleaned with strong, hot lye.

— When washing cambries, do not allow soap to come in contact with the fabric.

— Ink stains on silver can be removed by rubbing with a paste of chloride of lime and water.

— A small quantity of turpentine added to stove blacking will make the stove easier to polish.

— To keep stoves from rusting during the summer: rub with kerosene and wrap well in papers.

— A bottle of flaxseed oil, chalk and vinegar mixed to the consistency of cream, should be kept in every house for burns, scalds, etc.

— Housewives, provide yourselves with a bottle of ammonia and a package of borax before commencing your semi-annual renovations.

— A few drops of glycerine in a bottle of mucilage will cause the mucilage to adhere to glass when used upon labels.

— Quick-silver beaten up with the white of an egg and applied with a feather to every crack and crevice of a bedstead, is the very best bug preventive.

DOMESTIC RECIPES.

Fried Lettuce.

Chop lettuce very fine and, if liked, the tops of two or three young onions; add two well-beaten eggs and a little salt; put a piece of butter the size of an egg into a frying-pan and when melted pour in the mixture; turn when of a light brown and serve with or without vinegar.

Asparagus.

Wash and scrape very clean the white part of the stalks of asparagus and throw them into cold water; tie into bundles; cut the root ends even and tie the bundles in a piece of muslin to preserve the tops; fill a wide sauce-pan with water and when it boils put in the asparagus with a spoonful of salt and boil for about twenty minutes—longer if the asparagus be old; toast some thin slices of light bread nicely on both sides, butter, cut into squares and place upon a platter; take up the asparagus and lay upon the toast. Serve with melted butter in a tureen.

Strong Beef Tea.

Cut up two or three pounds of lean beef into square dice and put into a jar; cover over and stand in the oven for three or four hours. This rich stock can be mixed with hot water to the strength required. ECONOMY.

Bath, N. Y.

Ginger Bread.

One pint of molasses; one cup of sugar; one cup of butter; four eggs; six cups of flour; one pint of butter-milk; two tablespoonfuls of ginger; one tablespoonful of cinnamon; two tablespoonfuls of soda.

Jelly Cake

Two eggs; one cup of sugar; butter the size of a walnut; two-thirds of a cup of butter-milk; and one half teaspoonful of soda; three cups of flour; flavor to taste. Bake in layers.

Cream for Cake.

One cup of sweet milk; put one half on to boil, thicken the other half with a beaten egg and a little flour and pour into the milk on the stove, stirring constantly; let it boil up, then remove from the fire, sweeten and flavor to taste.

Sponge Cake.

One cup of sugar; three eggs; one cup of flour; one half teaspoonful of soda dissolved in two tablespoonfuls of cream-of-tartar.

Ohio. FARMER'S WIFE.

Rice and Cheese.

Boil one teacupful of rice until about tender and dry, careful to preserve the grains whole. Slice some cheese very thickly and into a pudding pan put: first, a layer of rice seasoned with pepper, salt and a very little butter; then cover the rice with a layer of the cheese; again rice and cheese and so on until the pan is full, the cheese being the last layer. Over this pour a pint of milk and bake in a good oven one-half hour. This dish we prefer to macaroni. E. M.

QUERRIES ANSWERED.

As the fly season approaches, I am tempted to ask you for a recipe for home-made fly poison. I find purchasing fly paper from our grocer not only expensive but at times the paper is utterly worthless. ECONOMY.

Bath, N. Y.

ANS.—In reply I give you the proportions of quassia, molasses and water which we have used in our family with satisfactory results: Steep one-fourth ounce of quassia chips, procured at any druggist's, in one pint of water; when the stength is out of the chips, strain, cool and add two or three spoonfuls of molasses. Flies drink this eagerly and are soon destroyed. It may be necessary to allow more quassia to a pint of water according to its strength; of this, however, you must be the judge.

Will you please tell me how to make baking powder for buscuit, cake, etc?

MRS. CLAYTON.

ANS.—Powder and thoroughly dry separately three-quarters of a pound of *pure* bicarbonate of soda; one-half of a pound of tartaric acid and three-quarters of a pound of corn-starch; pass through a sieve several times and *press* into tin boxes which should be covered tightly to preserve the powder from moisture and air. These ingredients had better be purchased at a druggist's as the success of the powder depends upon the purity of the soda and tartaric acid.

WHAT is celery vinegar and how is it made?

A. S.

ANS.—Celery vinegar is simply vinegar to which *bruised* celery seeds have been added—proportions, three-quarters of an ounce to a quart of vinegar.

Hygienic Information.

TYPHOID PNEUMONIA—CLOASMA.

C. J. S., asks Dr. GOODENOUGH to enlighten him with regard (1,) to typhoid pneumonia, (2), also to give his opinion concerning the cause and possible cure of cloasma.

ANS.—There is no form of disease with which pneumonia may not be associated, especially when the powers of resistance have been enfeebled by the results of previous illness; and among these complications, what is called typhoid, asthenic, adynamic, or nervous pneumonia is by no means uncommon. What definitely constitutes this malady has not as yet been unanimously decided; pneumonic affections as to which some physicians give other names, are classed by others under this head. One form is a complication with typhoid fever, when it is either of a mild or malignant type. In the former case, it ordinarily begins suddenly with a strong rigor, the pneumonic expectoration begins early, and the infiltration can be detected by physical examination; in the latter, its access is slow, the sputa characteristic of pneumonia are often absent, or instead of their usual bright red or rusty-brown color, they are of of a dirty-brown. Early in this disease the nervous symptoms become so prominent that it is sometimes mistaken for typhus or meningitis. Lobular pneumonia, a frequent complication or sequel of typhoid fever, is sometimes called typhoid pneumonia. It often comes on at the hight of the disease when it only shows itself, as a rule, by an increase of fever, sometimes with rigors, but without an increase of cough or pain. It also frequently supervenes during convalescence in which case it is likely to follow the ordinary course of croupous pneumonia.

What is generally held to be genuine typhoid pneumonia occurs in persons who, from some cause or other, are in a weakened condition. Hunger, abuse of alcohol, previous or still existing disease, excessive bodily or mental exertion, advanced age and very frequently bad hygienic conditions, are the most common causes. There are a few medical men who say they can detect idiopathic features in this disease, which constitute it a distinct ailment; but there is little or no doubt but that the difference between it and the ordinary form of pneumonia is quantative not qualative, in degree not in kind.

For account of pneumonia see next issue.

(2.) Cloasma is a cutaneous affection marked by one or more broad, irregular-shaped patches of a yellow or yellowish-brown color, occurring most frequently on the front of the neck, breast, abdomen, and groin. The forehead, eyelids, cheeks, and upper lip are also sometimes affected, which then take on a dark-brown color. In women, in addition to the causes that produce it in man, it is often associated with disorders peculiar to their sex. Among males it frequently happens after long-continued malarial diseases, and also in affections generating a bad habit of the blood. Long continued action of the sun's rays, especially in a moist atmosphere, protracted labor during the summer hoats in tropical climates or even in our own; many cutaneous affections as well as disorders resulting from vicious practices, also cause a pigmentary deposit, while it sometimes is merely the result of scratchings. In many cases sulphur applied externally in any form, will speedily remove the discoloration, and should an ordinary application fail, its use in baths or urmigation is likely to prove more efficacious. The removal of the pigment is nearly always readily accomplished by any means that cause a superficial inflammation of the skin and the desquamation of the epidermis. Cover the affected portion of the skin with a piece of linen, accurately fitted and kept moist for three hours with a solution of corrosive sublimate, (five grains to an ounce of water); keep the edge of the cloth constantly dried, otherwise the solution will collect and destroy too deeply. A safer remedy, however, in ordinary hands can be found in repeated applications of iodine or iodized glycerine.

News of the Week.

NEWS OF THE WEEK.

THE remark made last week with regard to the lack of general interest in domestic and foreign news, might be justly repeated this week. At home, Anderson, member of the Louisiana Returning Board lately convicted of forgery in connection with the Presidential election, has been released by the Supreme Court of that State, on the ground that his offence did not amount to forgery under the law. It is said Gov. Nicholls is much relieved by this decision, as he had promised Hayes and the "visiting statesmen" to pardon the prisoner, and would have incurred much odium from extreme Democrats by doing so. The trials of Wells, etc., will probably collapse owing to this issue to that of Anderson. Secretary Sherman on Tuesday the 19th, made a powerful argument before the Senate Finance Committee in favor of early resumption of specie payment as the present law ordains. It is said here his representations were so strong that hostile action is hardly probable. The largest dry goods house in this city has already resumed, paying out, in change, indifferently gold, silver or greenbacks. It is highly probable that the charge of the Indians will be transferred from the Interior to the War Department. Officers of the army may be a trifle rough with the red-skins, but the rankest army-hater has never accused them of trickery or dishonesty in their dealings with them. Great preparations are being made in anticipation of an extensive Indian war when the weather gets milder. Sitting Bull and his braves are expected to take a hand. At moderate calculation the Indians likely to be on the war-trail will outnumber our troops two to one. The Committee on Railroads report favorably on a bill for the construction of a freight railroad connecting the Mississippi Valley with Atlantic tide-water, and so greatly cheapening transportation charges, an end devoutly to be wished for. On the 18th, St. Patrick's Day was celebrated by Irish societies throughout the country, and in Montreal, a visit and harangue of the pardoned Irish convict and recent bankrupt, O'Donovan Rossa, led to a fierce conflict between the Catholic and Protestant Irish, or Orangemen of that town, resulting in several *murders* and many severe injuries. Pity that immigrants to whom this country gives the food, shelter, and protection denied them at home, cannot leave their paltry bigotries and partisan animosities behind them! Polk, doorkeeper of the House of Representatives, has been dismissed, merely because he bled the national purse by appointing unnecessary assistants, etc., to repay the Congressmen whose votes elected him! Contrary to the old saying, "A mild winter, a fat churchyard," during the past winter the health of this city was very exceptionally good. The present cold snap seems pretty general throughout the North, and news just from Europe show it has been equally severe over there. Three Molly Maguires to be hung to-day at Bloomsburg, Pa.

Across the Atlantic diplomats are still exchanging views, and busy writing and telegraphing; but all the while soldiers are sharpening their swords and getting their powder ready. Indeed the chances seem to be growing stronger that England and Russia will soon be at loggerheads. The published text of the treaty fully confirms the correctness of the version already given to our readers. England still insists that every clause shall be submitted to the congress. Russia virtually concedes the point, but declines to do so explicitly through dictation from another Power, but meanwhile the English and Russian *people* are becoming mutually inflamed and it will probably require a good deal of bloodletting and misery to cool them. The Austrian ministry has got from the legislature the 60,000,000 florins asked for to put a part of the army on a war footing: vote 39 to 20. There is a report of a Russian-Austrian alliance which is highly improbable, just yet, and another of a Russian-Turkish alliance, much more likely to be true. Oman Pasha, Reouf Pasha and Gen. Ignatieff have returned to Constantinople, and are strongly urging such a step. The Rusians are still encamped about Constantinople, ready to occupy it on the outbreak of hostilities, England is thinking seriously of seizing upon the Asiatic side of the Bosphorus, and rails for a railroad along the coast have been already purchased. The last reports are: German interests not affected; the only hope of peace rests upon the speedy assemblage of the proposed congress, and the chances for its assembling at all are daily dwindling. A great international pedestrian contest has nearly eclipsed the war excitement in London. A match was made with prizes—$2,500 to the first; $500 to second; $250 to third; contest open to all comers; $50 entrance money; prizes awarded to those who came in ahead at the close of six days by pushing on in any way without support, either by walking, trotting or running. The Star-spangled Eagle once more screamed as his representative, O'Leary, lately of Chicago, and formely of Cork, Ireland, came in first. Distance 520 miles and a bittock, six days, less about 4½ hours, the best pace on record.

A sympathetic but inquisitive young man, who was visiting a county prison, gently asked a girl prisoner the cause of her being in such a place. "Oh," said she, with a contemptuous toss of the head, "I stole a watermill, and got off safe, but, like a fool, I went back after the stream that turned it, and was arrested." The sympathetic young man left immediately.

The uncalculating enthusiasm which often accompanies temperance revivals was peculiarly illustrated recently in Arkansas, where a club of young men pledged themselves to abstain from the use of alcoholic liquors, and then celebrated the occasion by getting drunk on beer.

It is said that there was never before so much lumber put into the Aroostook waters in Maine in the same time as within the past two weeks. The woods are full of men and teams.

Happy tidings for nervous sufferers, and those who have been dosed, drugged and quacked. Pulvermacher's Electric Belts effectually cure premature debility, weakness and decay. Book and Journal, with information worth thousands, mailed free. Address PULVERMACHER GALVANIC CO. Cincinnati, Ohio.

Manufacturers of Clothing and ladies' suits find the New Davis Sewing Machine adapted to the full range of their work, trimming, binding, sewing thick and thin goods, over-seams, without any difficulty, and requiring no basting or change of tension. The DAVIS SEWING MACHINE CO. are enlarging their manufactory at Watertown, N. Y., to enable them to supply the increasing demand for their machines.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 23, 1878.

BEANS AND PEAS.—Medium beans continue to decline and the abundance of cheap spring produce does not warrant an early revival of local business. Marrow are weak and dull, and likely to be until affairs in Havana assume a solid condition. White Kidneys are dull and seem to be dropping to marrow figures. Red have some small sale. Pea beans quiet and lower. Black are a more manageable stock. Canadian peas in bulk and bond steady at 83@84c. Green peas held with rather more confidence. $1.15 for fair; $1.20 for selected. Southern were neglected at the former high rates and the shading does not bring buyers. Receipts for the week 3,000 bbls beans; exports 551 do.

We quote:—Beans, medium choice, $1.60@1.65; other, $1.45@1.55; marrows, choice, $1.60@1.62; other, $1.50@1.55; pea, $1.50@1.65. White kidney, choice, $1.50@1.65; other, $1.85@1.95; red, choice, $2.10@2.30; other, $2.35@2.40. Turtle soup beans, $1.75. Lima, $3.

BEESWAX has increased demand and is somewhat stronger in price; Western and Southern quoted at 27½@28¾c.

BROOM CORN.—Is in moderate stock and steady in price.

Green brush at 6@7½c.; green hurl, 5@6½c.; medium green, 4@5½c.; red-tipped, 4@5c., and common red, 3@3¼c.

BUTTER.—Receipts now include a fair quality of new, but old is adding unfavorably to the supply. Fine old is scarce, in fact really high grade is about gone, but there is a line of trade that asks for table quality old as long as it lasts. There has been a material marking off in some lines of State that ought to have been marked off long ago; now owners have have both to drop figures and hunt up customers. In some useful stock now exposed 20c. is quoted as weak as 25@26c, was quoted strong at one period. Shipment or grease will be the likely fate of much State stock before May. New butter sells well and prices are full; buyers will not lay in much while, and the market may be easily crowded if not overstocked. Western butter is active for the moderate lots of nice factory that come; but rather easier in tone.

NEW.—State, half tubs, choice, 28@32; good 29@31. Welsh first, 27@31; second, 27@30c; poor new, 23@26c; Western creamery ranges at 35@36c.

Exports past week, 3330 pkgs.

OLD.—State dairies, good to choice 26@27c.; fair, 23@24c.; from 15@18c; selected firkins 24@25c; fair to good 18@23c; poor 14@16c; selected half tub 29@30c; other, 26@28c.; choice Fall Welsh 28@30c. Fair to prime 20@24c.; Welsh dairies, 24@26c. State creamery, 30@32c; other, 26@28c.; other 19@20c; Western factory, fresh, low goods worth 19@20c.; greese 6½@7c.

CHEESE.—Exports for the week, 13,488 boxes. With the advanced season, and more winter-made stock coming forward than had been looked for there is a weak and irregular market, and the outside price made only for the very best stock.

Fancy factories, 13@—c.; good and prime, 12½@12¾c.; fair lots, 11@10½c.; poor, 10@10½c.; 7@10c., skimmed. Farm dairy, 11½@12¾c. for good to prime; 10@11¼c. for fair lots; 7@9c. for skimmed; Western factory, eheddar, 10½@11½c. for fine; 11½@12c¾. for good; 6@9c. for poor.

Liverpool cable, 67s. Gold closes 101¼.

Exports for the week, 14,538 boxes.

COTTON.—Export demand has been slow and the market closing weak.

Latest prices are for March, 10.93@10.94c.; April, 10 92@10.93c.; May, 11.17@11.18c.; June, 11.09@11.10c; July, 11.25@11.26c.; August, 11.23@11.24c.; September, 11.04@11.05c.; October, 10.81@10.85c.; November, 10.72 @10.74c.; December, 10.75c.

Quotations for spot cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	8 1-16	8 1-16	8 3-16	8 3-16

Fair	12 9-16	12 9-16	12 11-16	12 11-16

Stained.

Good ordinary, 8¼c. Strict ordinary, 8⅝c.; Low middling, 9⅜c.; Middling, 10c.

DRIED FRUITS.—General trade is slow; the high grades of apples are scarce and firm, but otherwise prices are scarcely settled.

Apples—State quarters, old, 5¾@6¼c.; new, 5½@6c.; Western quarters, old, 5@5¾c.; new, 5½@5¾c.; Southern, new, prime sliced, 7c.; fair to good, 5@5½c. Peaches—Peeled, new, 9@10c.; unpeeled halves, 4¾ 5c.; unpeeled quarters, 3¾@4c. Pitted cherries, 15@16c. Blackberries, 9@10c. Raspberries, 26c. Plums, 15c. and Southern at 12c.

EGGS.—Receipts for the week, 24,415 barrels, do. last week, 18,381. There is a fair demand but the enormous receips have kept prices low, in fact for a steady quotation eggs have not sold at their present point for over 20 years. There has been some speculation, but the mild tone of trade has checked the enterprise. Quality is good and dealers expect early good business. Poor stock would be rejected by all at present rates. Near points 11c.; fresh Western and Southern 10½@11c. poor 9½@10c.

FEATHERS.—Geese are dull and unsettled; 40@c. is bid for prime but not accepted. Turkey wing and tail feathers are being used by manufacturers. Mixed 15c.; tail 25c.

FLOUR.—The tamo look of affairs on the other side, and the opening of lake navigation which will give earlier full supplies of wheat weaken the market and tend to free offerings at the reduced prices.

Latest prices are $4.15@4.75 for poor to fancy superfine State; $5.00@5.15 for common to fair extra do; $4.90@5.10; $5 10@5 60 for good to choice do.; $4.15@4 75 for superfine, Indiana, Iowa, Michigan, Ohio, &c.; $4 75@5 15 for very poor to good shipping extra do do., (chiefly at $4.90@5.10) and $5 15@5 50 for good to choice extra do.; common to choice white extras, $5.35@6.50; fancy do. at $6.50@7.50; (the latter an extreme); red and umber winter wheat, inferior to choice trade and family, at $5.10@6.25; round hoop Ohio at $4 80@5 25, and trade brands of at do. $5.40@6.75, the latter for choice; St. Louis, $5.25@5.85 for poor to fair extra and $5.10@7.00 for good to fancy; (with a few brands of very fancy quality quoted up to $7.25@7,50); Minnesota clear, $4.85@5.00; Minnesota "straight," common to fancy, at $5.50@6.65, and patent poor to very choice, $6.10@8.25, with a few fancy at $8.35@8.50; unsound stock at $2.35@5.75; city mill extra at $5 90@6.30 for fair to very choice for West Indies; do. for England $4.85@5.00; do. trade and family extras, $6.35@7 50; do. South America, $6.35@ 7.35 for fair to fancy; No. 2 at $2.50@3.80.

Corn meal is selling at $2.50@2.95 for Brandywine and $2.85 for yellow Western.

FRESH FRUITS.—Exports of apples 1000 bbls. mostly strong Russets. Apples are quiet but fairly firm. Choice Red and best Russets, $4.@6.50 fair to good, $3@4. Cranberries are going out well at former quotations. Strawberries from Florida and Charleston, 50@1.25 quart. Oranges firm and salable $5.80@6,80; hot-house berries down to $2. Peanuts quoted as in our last, the demand not as brisk as it should be in this style of weather; best, $1.35@1.40; prime 85@-1.20. Pecans, Texas, $@10 lb.; Hickory nuts $1.00 per bush.

FURS AND SKINS.—There is no change to note, No. 1 quality.

	Nor. & East.	West & N. W.
Otter, ₩ piece	$3 00@4 00	$2 00@2 50
Gray Fox	40@ 45	40@ 45

striped		7@ 30
Wolf, mountain		1 50@2 00
prairie		50@ 60

Southern raw skins are worth 20 per cent less than Western.

GRAIN.—The probabilities of an early adjustment of the difficulty abroad, the early opening of navigation, and larger supplies looked for soon weakens prices.

Latest sales are of No. 2 red at $1 30@— ungraded red and amber State, $1 30@—; white, $1 40; No 1 Northwest spring, $1 27; No. 3 Chicago, $1 22½; No. 2 red for March at $1 23; No. 2 Milwaukee spring, $1 27. Rye has been very active, purchases within a week reaching fully 250,000 bush, largely for the German markets, closing at 72c. for Western; 76@77½c. for State and 76c. for Canada. Corn is weak and quiet. Latest sales are of New York No. 2 at 54@55½c.; steamer mixed, March, 51c. Oats of New York extra white, at 34½@40c.; do. No. 1, March 31½c.; No. 2 white, 35½c.; mixed Western, 31@31½c.; white Western, 38@39c.

HAY AND STRAW.—Supplies are larger, and buyers are not purchasing much beyond actual needs in hopes of an easier market.

Bale hay, 60@65c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 45@ 55c. for long rye; 45@50c. for short rye, and 40@45c. for oat.

HOPS.—The export movement this week has been very moderate, and the demand from receivers small, but stocks are now excessive, and prices are held as before. Quotations are:

State choice to fancy, 11@12c.; good to prime, 8@ 10c.; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do. 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Californians, 12@14c.

MAPLE SUGAR.—Increased supplies are attended with lower prices for molds and syrup. Small cakes, 13c.; large, 8@11c. Syrup, 75c.@$1 ₩ gal., with can.

OIL-CAKE.—Western is quoted at $30@$30.25 ₩ ton.

POULTRY AND GAME.—There is a good demand at fair prices. Southern live is largely included in the receipts with some young chickens at $1.25 per pair.

N. J. chickens, 10@13c.; W. fowls, 11@13c.; Turkeys, @14c.; Toms, 6@8c.; Ducks, N. J., pair, 87@$1.12; Geese, N. J., $1.75@2.00; Western, $1.12@1.50.

Dressed poultry has a fair demand with a reasonably supplied market. Chickens sell the best, turkeys have been plentier than wanted as the supply includes many frozen parcels. Vermont frozen has brought 22c.

Fancy Phila. and N. J. turkeys, 16@18c.; good, 8@ 6c.; large or Toms, 7@9c.; chickens, choice, 8@9c; good, 11@13c.; common, 6@7c.; ducks, choice, 15@20c.; other, 21@22c. small and slips, 18@19c.

Game is generally lower.

Hares and rabbits, pair, 20@25c. Canvas-back ducks, $1.00@1.25; Red-heads, $1.00; Mallard, 35@40c.; Teal, 25@40c.; Quail, prime, $2.75@3.00; soft, $2.25@2.50. Partridges, pair, 75c.@$85c. Grouse, $1.00@1.50; poor, 90c.@$1.10.

PROVISIONS.—Hog products have been in freer demand for export and have hardened a little in price.

Mess pork, $10¼@10,40 for spot lots; $9.85 @10 for March and April. Bacon at 5¼c. for long clear and 5¾c. for short clear. Lard—Western steam, 7.37½c. 7.40c. for short, 7.41@7.45c. for May, 7.54.755; Tallow at 7 3-16c. for prime. Stearine, 7½c. for prime Western. Beef hams at $15.50. Beef—New extra mess, $12.00@12.50; plain, $11.00@11.50; new packet, $14.75; family mess, $17.50; extra India mess, $27 for city brands; do. Philadelphia, $25.

SEED.—Grass are weak. Clover, 7¾@7¾c. for Western; 7¾@8c. for State. Timothy, $1.35. Rough flax, $1.45.

TOBACCO. — The new crop comes in more freely, while demand is not showing any improvement and prices are easy.

KENTUCKY LEAF.

Ohio assorted lots	7½@10
Wisconsin assorted lots	7½@ 9

VEGETABLES.—There is a weak feeling in potatoes, holders fear sprouting and good qualities are offered low.

We quote Peach Blows $1.50@1.75, bulk and doubleheads. Early Rose, $1.00@1.25; Peerless, $1.25@ 1.50; Nova Scotia, $1.95@2.00; Sweet, $2.25@2.50. Cabbages, 100, $3.00@4.00; red, 5@6. Marrow squash, bbl., $1.50@2; Hubbard do., $2.00@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 62@75c. Red and yellow onions, $1.00@1.25; white, $1,25@1.75. Celery, doz., 75c.@$1. Hot-house mushrooms, ₩ ℔., 40@50c. Radishes, 100 bunches, $1@1.50. Lettuce, small, dozen, 75c.; large, $1@$1.50. Cucumbers, doz., $2.25@2,75. Rhubarb, doz., $7@8. Spinach, Southern, @2.25 ₩ bbl. Bermuda, $4,50@5.

WOOL.—There has been but little demand from manufacturers, and the advancing season exerts rather a pressure to sell, with slightly easier prices. There is a desire to urge business a little by making concessions.

Ohio, Pennsylvania and Virginia—XXX and picklock, 44@46c.; XX, 42@44c.; X, 42@43c; No. 1, 43@44c. No. 2, 35@37c.; common, 34@35c.; combing, 52@55c.

New York, Michigan, Indiana and Wisconsin—XX, 26@38c.; X, 36@38c.; No. 1, 38@42c.; No. 2, 38@36; common, 32@33c.; combing, 46@50c.

Iowa, Vermont and Illinois—X and XX, 35@37c.; No. 1, 37@40c.; No. 2, 32@34c.; combing, 45@50c.

Missouri, Kentucky, and Tennessee—Washed fleece, 32@42c.; unwashed, 25@30c.; unwashed combing, 30@36c.

LIVE STOCK MARKETS.

NEW YORK, March 25, 1878.

BEEVES.—Receipts for the week, 9,863 head: do., last week, 8,029 do. A noticeable feature was the unusually fine condition of the droves. As the supply was not heavy the pens were quite readily cleared on the several market days, a good export demand helping trade. Prices have advanced a shade since Wednesday last. At the close light steers brought 9@9¾c.; good weights, 9¾@10¼c; heavy and extra quality, 10¾@10¾c.; fancy, 1,500@ 1,600 lbs., 11@11¼c.; fat bulls, $3.75@4 per 100 lbs.

COWS AND CALVES.—Few extras arrive at this time, new butter being an inducement for dairymen to hold good milkers, and interior trade in cows is about as good as it would be here. Old prices for ordinary stock nominal, say $40@50 per head.

VEAL CALVES.—Live are easy at 5¾@7½c. for ordinary to good; extras, 8@8¼c. Hog dressed nominal at 6@10c. prime fresh in fair demand.

SHEEP AND LAMBS.—Receipts for the week, 16,150 head; do., last week, 17,878 do. A brisk trade has ruled at 6¾@7c. for sheep; yearlings $5.30@625 for 100 lbs.; spring lambs lower, $4.50@7 each, the latter for prime 45 pounders.

SWINE.—Receipts for the week, 17,405 head; do. last week, 25,240 do. A mixed price at the close was 4½@4¾c. Market dull and unsettled. Country pork, 5@6¾c. for heavy to light State and New Jersey.

Cough that will not yield to ordinary remedies, may be thoroughly cured by Dr. Jayne's Expectorant, a most effective remedy for all Bronchial and Pulmonary Disorders.

Reading for the Young.

SWING, CRADLE, SWING.

Baby is a sailor boy—
Swing, cradle swing!
Sailing is the sailor's joy—
Swing, cradle, swing!
Snowy sails and precious freight—
Swing, cradle, swing!
Baby's captain, mother's mate—
Swing, cradle, swing!

Never fear, the sails are set—
Swing, cradle, swing!
Stormy gales are never met—
Swing, cradle, swing!
Little eyelids downward peep—
Swing, cradle, swing!
Anchored in a cove of sleep—
Swing, cradle, swing!

LETTERS FROM BOYS AND GIRLS.

From Honolulu.

Here I am again; hope you are not tired of seeing me. Uncle True, I am glad you liked those ferns so much so as to think of having them mounted. If I come across any pretty specimens of mosses and ferns I will send you some if you like; perhaps you will be astonished to hear that we have over 300 different kinds of ferns on our islands. I am the possessor of 21 of these. I keep them mostly for "spatter-work." You say if you knew me by any other name than "Hawaii nei," you would get even with me. I like "to give better than receive" and I will keep you in ignorance of it for a time, at least.

"Rose Geranium" I thoroughly agree with in regard to a home library. I am passionately fond of reading, and eagerly peruse everything that happens in my way; it is to be hoped that it is of the instructive kind. I have copies of Shakspeare, Tennyson and Longfellow, the two latter are my favorites. We have the whole set of Dickens' works. I have been presented with "Alice and Phœbe Cary's Lives and Works," I enjoy this book very much, also a book of elegant extracts, "History of Josephine," and two volumes of miscellaneous home readings. (Next time, if you like, I may tell you of the "parlor entertainment," some of us young people intend giving soon, consisting of three dialogues taken from one, of the latter two volumes mentioned.) I like history, and remember pretty well the English history. I learnt at that most dreaded place to most girls namely, "A convent boarding school," but as I look back, I find I have spent many happy hours there.

I had the pleasure, not long ago, to take a moonlight horse-back ride to the beach, three miles distant, and there, for the first time in my life, to look through a telescope. Venus in the phase of a new moon, Saturn with his belts and satellites, and Sirius's bright light, were magnificent to behold! But here I am rambling on at a great rate; hope Y. B. is not present. Oh, dear! "Slayerofconceit" be quiet a little longer, and then you may sputter all you like.

Cousin, "Loretta," it was real kind of you to tell us about your good time at Christmas. Our Sunday-school had a tree, a very pretty tree too, but we were minus a Santa Claus; nevertheless many very pretty presents were distributed. I was the lucky receiver of six from the tree; in all, my presents number thirty. They are beautiful, some costly, and all useful, so you see though I lack brothers and sisters, I have many kind friends. You thought I would relate to you my adventures with my fellow cannibals, at stewing picnics? Well, here is one if you like to hear about it; but perhaps my letter will be too long: will it? You seem to say no, so I'll proceed:

Ten of us were to start at 8 A. M., on the 16th of November, (our Sovereign's birthday), for Kapiolani Park; nine of us met at appointed time, tenth was missing, so we proceeded to meet him. (Allow me to mention here that we young ladies, as we style ourselves, rode side-saddle, most of us wore green wreaths called Malie leys, pronounced Myll lays; they are very sweet!) We found our tenth, after one of our party had fallen from his horse in attempting to rescue a bag which contained some tongue sandwiches, (Sandwich Island tongues, too.) Our tenth sprang into his saddle as he thought, but suddenly found he was over on the other side of his horse grasping terra firma. Well, we started and had no more mishaps, but whiled away twelve hours, riding, walking on the beach, and eating lunch and supper with a hearty relish, under the grand stand at the park; came home, well satisfied with our holiday, but too tired to attend the ball that took place in the evening.

Many thanks for your kindness in listening to "Hawaii nei," who bids you good-by with "Aloha nui," in which Uncle True may have a small share. Hawaii Nei.

A Sensible Suggestion.

Dear Cousins:—Don't jump so at the sight of a strange cousin who comes to join your quarrelsome circle. To help you all along, if she can, to quarrel? I hear some one say. No, by no means, just to have a sensible chat, in a cousinly way, and give her opinion on some little points. Let me look around a little before I commence and see my cousins. Why here is "Madcap Mollie" extending her hand to bid me welcome! So much has been said about "Slayerofconceit," that I should think he would soon get tired of hearing his name, but perhaps it pleases him. It is too bad to have the girls against him; it is always better to have them on one's side. Bivalve, I want to hear something more from you on books. I like to spend my leisure moments over some good book. But I do not have much time. We live on a large farm and it keeps us busy to do the work in the house. We might tell each other about fancy-work and send patterns to the Rural for each other. I am making a rug now. I have a toilet set completed, made of perforated card board. Should like to have some one tell us how to make paper flowers. Well, Uncle True, if you don't throw this in that horrible waste basket I will try again. I will try and get enough subscribers if I can to secure the "Criket," for I think it would surely be a household pet.

Bitter Sweet.

Again.

Well cousins, I've come come again whether you welcome me or not. I have written two letters before. There seems to be a lull in the storm that raged so furiously for a while in the young folks' column, but it is getting dark again, so girls look out for another squall. "Miss Bertha" had best be careful, or she may arouse the temper of "Slayerofconceit." I tell you Young Bach there is a chance for you now. Carrie B. H. would like to arrange a correspondence with you. It is probable that if you comply, you will never be able to assume the name of Old Bach.

M. P. H. would like to know how to prepare autumn leaves. I will tell you how I did mine: First press them till they are thoroughly dry, then dip them into melted bees-wax, removing them as quickly as possible. Care should be taken to keep the wax hot, or the leaves will not be smooth. When they are finished they look very much like wax. They are very pretty twisted on wire, and arranged in vases.

West Millcreek, Pa. Cousin Emma.

Something about Nothing.

Dear Cousins:—I suppose you wonder why I have come again so soon. Well, for two reasons. One is that Uncle True was so kind as to print my other letter, and the other is to correct a mistake.

Referring to the question that I asked Katie and Susie, I wish to again ask if the initials of the boys' club were not B. O. C., instead of B. O. T.? I hope that "Jim Crow" will write again to notify us that so much work and study have not made him ill. I am very much obliged to Lillie Lee for the information she gave in her last letter, and I hope she will write again and tell how to make some of the candles she spoke of. Could she tell this poor Cousin how to make pop-corn balls with sirup?

I would say to Lottie King: Do not think that your letters are not read with as much interest as some of the older ones, for I assure you they are—by myself, at any rate.

At present I am reading "Other Girls," by Mrs. Whitney, and "The Hero of Falcon's Island." The last is about a boy who played Robinson Crusoe. I hope that "Madcap Molly," "Ivy," and all the other Cousins will write often.

Brown Badger.

Of Course, Certainly.

Dear Uncle and Cousins:—I should like to join the band of Cousins who write to each other through the Rural, and I think must have a very pleasant time. That is the reason I should like to join with you, for I am always ready for fun. So here I am. What do you say, may I join? I live on a farm and enjoy many country pleasures. My father has taken the Rural for fifteen years and we all like it very much. I am thirteen years old and have no sisters, but I have a brother older and one younger than myself. Wild Cherry is so proud because she can do some boy's work. I should like to have her come and eat some of my cake and see how I can clean up the table, etc. A few weeks ago there was a temperance lecturer here and he created quite an excitement. I was one of his disciples. Therefore I sign myself.

Coxsackie, N. Y. Young Teetotaler.

From Lizzie.

Dear Uncle and Cousins:—This is my first attempt at sending, but not at writing, a letter to the Rural. I live in the country, and pity the girls that have to live in the city. We have pleasant times here. Why do not some of the Cousins write about flowers. I like flowers very much. We have a Conservatory at my Grandma's. We have two lemon trees, one has nearly sixty lemons and plenty of blossoms on it. We have Calla Lilies in bloom; and I cannot tell all the others we have, in this letter. We have two pet dogs whose names are Dot and Curly. I would like to see Uncle True and the Cousins very much. I would like to get two subscribers for the Rural, so I could get a Rural "Cricket." Will "Lillie Lee" please send those candy recipes, and she will greatly oblige. Lizzie.

River Edge, N. J.

As Soon as the Roads Dry.

Dear Uncle True:—Here I am again, but I hope you are not displeased. As soon as the roads get dry enough I intend to try to get up a club for a "Cricket." The roads now are so muddy that when I go to town I don't pretend to go on them, but go back almost to the woods and take the railroad. Saturday I was rather late, and I came home on the road; I sunk in the mud over my rubbers. I should like to correspond with Lillie Lee and Madcap Molly. Will Rose Geranium publish the name of the little girl who wins the prize she offers? I can and do darn my own stockings. I like the Rural *ever so much* and I missed it greatly last year. We are having beautiful weather now, or did have last week; it was quite like summer. Jennie E. V. A.

Ft. Howard, Wis.

She Encouraged Him.

Dear Cousins:—Will you admit me into your circle? I am a constant reader of the dear old Rural. I will gladly join "Madcap Mollie" in her good work. A word to "Wildfire:" Come again, sir, and don't let Miss Bertha drive you from the field. I don't think "Slayerofconceit" any more conceited than the rest of us. Come out with your better virtues and show the fair Cousins that you are not half so bad as they are trying to make you appear! I, for one, am not against you. Blue Bell.

Elm Point, Ill.

Capital Advice.

Cousins all:—I have just finished reading this week's Rural and feel as though I must have my say again, if my former letters did not make such a stir as some others. I want to speak a word in favor of "Slayerofconceit." If you have read his last letter you have found that it was straightforward and gentlemanly, showing that he really meant nothing discourteous, and I say that he was a regular trump to write it. Let us write such letters as Lillie Lee's last. I am sure they are more instructive and will not make us gossips, but a set of jolly, old-fashioned cousins. Alice V.

Wildfire Ablaze.

Dear Cousins:—No doubt some of you thought that "Snowdrop's" sarcastic and talented (!) letter would effectually silence me, but it is not so. "Snowdrop" seems, (as a young man said in our Lyceum the other night,) to simmer everything down to the climax. I will own that boys as well as girls, do go to extremes in fashion; but fashion must be followed if it kills, at least the girls, or most of them seem, to think so. But enough of this. If Uncle True prints this, I will try and write something more sensible next time.

Wildfire.

The Puzzler.

HISTORICAL ACROSTIC.

1. A Grecian general. 2. A king of Ethiopia. 3. The father of Charlemagne. 4. A Carthaginian general. 5. A king of Pontus. 6. The wife of Julius Cesar. 7. A Grecian battle. 8. THE OLDEST CHRISTAIN HYMN.

[In Book III of Clement of Alexandria is given, (in Greek) the most ancient hymn of the primitive Church. It is there (one hundred and fifty years after the apostles) asserted to be of much earlier origin. The following version will give some imperfect idea of the spirit:]

Shepherd of tender youth
Guiding in love and truth,
Through devious ways;
Christ, our triumphant King
We come thy name to sing,
And here our children bring
To shout thy praise.

Thou art our holy Lord!
The all-subduing Word,
Healer of strife!
Thou did'st thyself abase!
That from sin's deep disgrace
Thou mightest save our race,
And give us life.

Thou art wisdom's High Priest
Thou hast prepared the feast
Of holy love,
And in our mortal pain
None call on Thee in vain;
Help thou dost not disdain
Help from above.

Ever be thou our Guide,
Our Shepherd and our pride,
Our staff and song.
Jesus, thou Christ of God!
By the perennial word,
Lead us where thou hast trod,
Make our faith strong.

So now, and till we die,
Sound we our praise on high,
And joyful sing.
Infants, and the glad throng,
Who to thy Church belong,
Unite and swell the song
To Christ our King.

SCRIPTURE WORDS AND PHRASES.

We propose first to call the reader's attention to a couple of monosyllables which deserve more notice than is generally bestowed on them. These are "his" and "its." The former is employed very frequently by our translators in places where we should now use the latter; indeed, the neuter possessive form "its" does not appear to have obtained a decided place in our language until some years later than 1611, though a few examples may be found in earlier writers. In Gen. i. 12 we are told that "the earth brought forth grass, and herb yielding seed after *his* kind, and the tree yielding fruit, whose seed was in *itself*, after *his* kind." In this verse it is quite plain that "his" must refer to "herb" and "tree" respectively, and that the pronoun must be accepted in the neuter sense; and many similar passages will occur to the mind of every careful Bible student. But there are cases in which the use of the masculine "his" in this way may lead to ambiguity: thus, in Matt. vi. 33—"Seek ye first the kingdom of God, and *his* righteousness," the modern reader is apt to take "his" as referring to "God" just preceding; but it is intended to refer to "kingdom," and is in fact equivalent to "its." Again, in 1 Cor. xv. 38, the authorized version has—"but God giveth it a body as it hath pleased Him, and to every seed *his* own body." In this case it will be evident to any one who reads the context with ordinary care that "his" must refer to seed; though a less attentive reader might suppose the pronoun to have relation to the word "God" just above.

Instances of this mode of diction are extremely familiar to students of our old writers. Lord Bacon supplies us with one—"Learning hath *his* infancy, when *it* is but beginning." Caxton, our first English printer, published a work treating of "Europe and *his* contrees; of Affrique and *his* regyons and contrees," etc.

The use of "his" as the sign of the genitive case, where we now employ a change of termination in the noun ('s), is less frequent in our Bible. In the chapter head of Ruth iii., indeed, may be seen a notable example in the edition of 1611, where it reads—"By Naomi *her* instruction, Ruth lieth at Boaz *his* feete." This has been since modernized, as the reader will see on turning to the Bibles of later date. Similar phraseology was very common in our old writers, and may be found in Common Prayer-book, in the "prayer for all sorts and conditions of men;" "and this we beg for Jesus Christ *his* sake." Spenser furnishes us many examples, *e. g.*,

"For that same Brute, whom much he did advance
In all his speech, was Sivius *his* son."

that is, was the son of Sylvius. And Lord Bacon, in his 29th Essay, has the following example—"Edward the Second of England *his* queen had the principal hand in the deposing and murder of her husband."

It is to be observed that "its" occurs but once in our version of Scripture, and in that place it is an innovation that has crept into the text since the time of James I. The instance may be found in Lev. xxv. 5, "That which groweth of *its* own accord," etc., where the ancient copy has "*it* own accord," such being a not uncommon way of writing the possessive case of the neuter pronoun in the Elizabethan age. Sylvester, the translator of Du Bartas (1605), gives us this instance:

"Much like a candle fed with *it* own humor
By little and little *it* own self's consumer."

In the Geneva version of the Scriptures, Acts xii. 10 is thus rendered: "They came into the iron gate that leadeth unto the city, which opened to them by *it* own accord."

Before us is a list of many Scripture words, to which we propose to call the teacher's and student's attention; but space forbids our extending this paper beyond its present limit. J. S.

PERSONAL ITEMS.

Mr. Wade's property, which is left to his widow, amounts to a total value of $65,000.

The debts which Victor Emanuel left behind him are reported to amount to $3,500,000,

The fortune left by the late apostolical successors of St. Peter is estimated at about the sum of $25,000,000. It is said that more than $400,000 in gold and notes were found in his apartments. He left the whole of it as the nucleus of a sum from which his successors might derive an income sufficient to replace that accruing from their lost Temporal Power, and enough to render them independent of any aid from their despoiler—the Kingdom of Italy.

Trees, Seeds, Plants, &c.

Evergreens for Lawns, Cemeteries, and Ornamental Grounds.

Norway Spruce, 3 to 4 feet high, strong and bushy, for shelter belts at very low rates by the car load. Also the largest stock of Nursery grown Evergreen and Forest Tree Seedlings in America. Evergreen seeds. Send for Catalogue. ROB'T DOUGLAS & SONS, Waukegan, Ill.

PERRY'S NEW YORK

HAY TEDDER.

This greatly improved and new model machine has been pronounced by FARMERS and AGRICULTURAL IMPLEMENT DEALERS to be by far the best and **cheapest Hay-Spreading Machine** in the world.

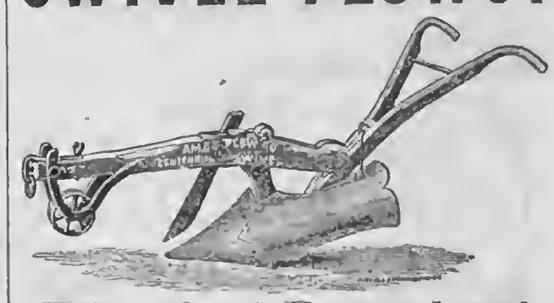
EVERY MACHINE FULLY WARRANTED.

All orders received on or before April 15th, 1878, will be entitled to a special discount.

Address OTTO E. C. GUELICK Manufacturer, Utica, N. Y.

Circulars and full description free.

CENTENNIAL SWIVEL PLOWS!



Triumphant Everywhere!

Accepted by the New England and Maine State Agricultural Societies. Superior to any for Level Land and Hillside.

AMES PLOW COMPANY,

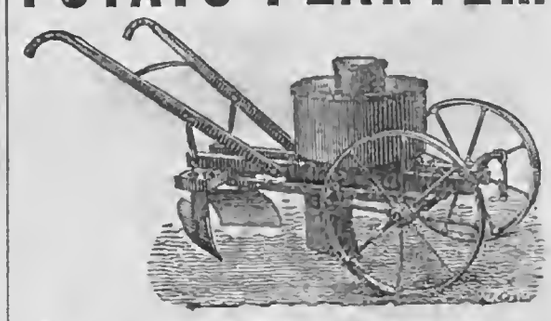
SOLE MAKERS,

53 Beekman St., New York.

Quincy Hall, Boston, Mass.

☞ Liberal discount to dealers and agents. Send for Circular.

TRUE'S POTATO PLANTER.



With it one man, with the aid of one horse, can plant five acres per day, viz., **Open the Furrow, Cut, Drop** and **Cover** the Potato with Fertilizer.

NASH & BRO., Manufacturers, 7 College Place, New York.

SPRING STEEL TOOTH HORSE RAKES.

Highest Award. Medal of Honor at the Centennial and Vienna Exhibitions.

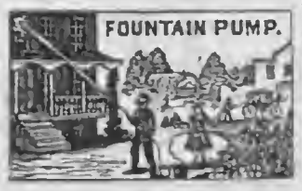
THE CHAMPIONS OF THE WORLD.

No Cogs or Ratchets. Easiest Hand or Horse Dumping. Purchasers prefer them to all others for Durability and Efficiency. Fully guaranteed; so no risk is incurred in ordering from us. Responsible Agents wanted, where we have none.

Send Stamp for Catalogues of Rakes, Threshing Machines, &c.

WHEELER & MELICK CO.,

ALBANY, N. Y.

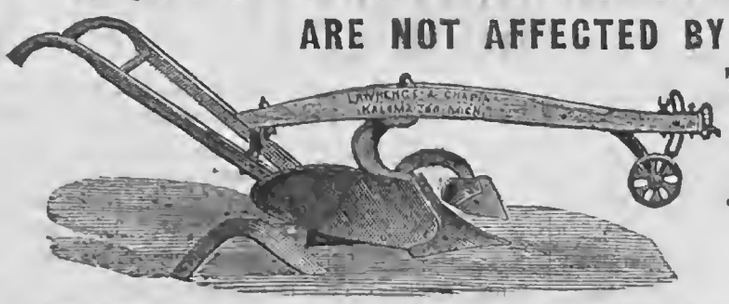


GARDEN ENGINE AND FIRE EXTINGUISHER. For Washing Windows, Carriages, etc. Protects Buildings from Fire, and Trees, Vines, etc., from Insects. Throws water 50 feet. Easily carried. No Dwelling, Country Home or Factory should be without the Fountain Pump. Send for large Illustrated Circular. J. A. WHITMAN, Sole Proprietor and Manuf'r, Providence, R. I.

DIAMOND IRON PLOWS.

With New Patent Jointer and Coulter that

ARE NOT AFFECTED BY CHANGE OF BEAM.



The only Plow WITH Wrought Iron JOINTER STANDARD ADJUSTABLE To any Depth.

25 to 30 lbs. lighter than any Chilled or common Iron Plow. Harder, Stronger, More Durable, Lighter Draft, Easier Handled, better Scouring qualities, and Stay in the Ground better than any other Plows made. All wearing parts are made of same metal. Every Plow warranted. Send for Circular. Made only by LAWRENCE & CHAPIN, Kalamazoo, Mich.

Wit and Humor.

SPARKS AND SPLINTERS.

VICTOR HUGO wrote to a "fraternal banquet" of workingmen that he could not be present, but sent them "a shake of his hand from the bottom of his heart."

Do kittens that have been mauled and teased in their infancy become Maltese cats in their advanced years? We paws for a reply.—*Philadelphia Bulletin.*

A Suggestion to the Traveling Public.

Tourists, emigrants and mariners find that Hostetter's Stomach Bitters is a medicinal safeguard against unhealthful influences, upon which they can implicitly rely, since it prevents the effects that an unhealthy climate, vitiated atmosphere, unaccustomed or unwholesome diet, bad water, or other conditions unfavorable to health would otherwise produce. On long voyages, or journeys by land in latitudes adjacent to the equator, it is especially useful as a preventive of the febrile complaints and disorders of the stomach, liver and bowels, which are apt to attack natives of the temperate zones sojourning or traveling in such regions, and it is an excellent protection against the influence of extreme cold, sudden changes of temperature, exposure to damp or extreme fatigue. It not only prevents intermittent and remittent fever, and other diseases of a malarial type, but eradicates them, a fact which has been notorious for years past in North and South America, Mexico, the West Indies, Australia and other countries.

ALTERING THE COMPLEXION.

BILL—"I say, Mary, run and ask Julo to come and play with us."

MARY—"You know, Bill, mother says you ain't to call him Jule—his name's Jul-ius."

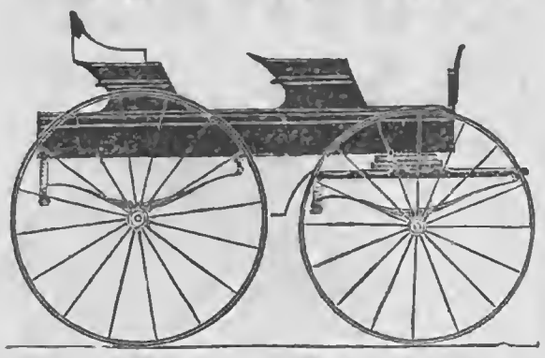
BILL—"Well, what does she call me Bill for, then? I shan't call him Jul-ius until she calls me Bill-ious."

WILBOR'S COMPOUND OF

PURE COD LIVER OIL AND LIME.

To the Consumptive.—Let those who languish under the fatal severity of our climate through any pulmonary complaint, or even those who are in decided consumption, by no means despair. There is a safe and sure remedy at hand, and one easily tried. "*Wilbor's Compound of Cod Liver Oil and Lime*," without possessing the very nauseating flavor of the Oil as heretofore used, is endowed by the phosphate of lime with a healing property which renders the oil doubly efficacious. Remarkable testimonials of its efficacy can be exhibited to those who desire to see them. For sale by A. B. WILBOR, Chemist, Boston.

THE CORTLAND



Platform Wagon.

To the Farmer and Dairyman, to whom a light-draft, easy-riding Wagon, capable of carrying from ten to fifteen hundred pounds, is a necessity, this is the

CHEAPEST AND BEST

Platform Spring Wagon made.

Every Wagon fully warranted.

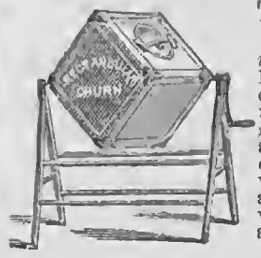
Highest Award at the Centennial!

THE IMPROVED BLANCHARD CHURN

PRICE GREATLY REDUCED

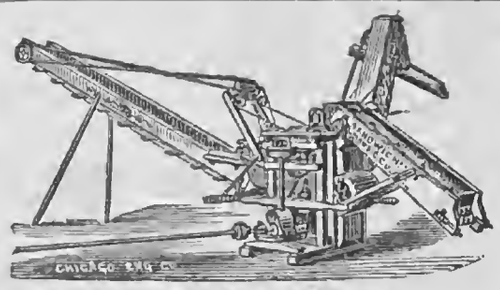
Perfect stock, best work, very efficient and durable. Nine sizes made, churning from one to 150 gallons. Warranted to be exactly as represented. Sold by all dealers in REALLY first-class Farm Tools.

PORTER BLANCHARD'S SONS, CONCORD, N. H., Sole Manufacturers. Send for Circular.



The Rectangular Churn

Simple, efficient and *always reliable.* No inside fixtures. Fifty per cent. in labor saved over *any other churn.* 5 sizes made. The Highest award given over all competitors at the late Dairy Fair in Chicago. An energetic man wanted in every town, to act as agent. One churn sent at wholesale where we have no agent. CORNISH & CURTIS, Fort Atkinson, Wis.



SANDWICH Manufact'g Company,

Sandwich, DeKalb Co., Ills.

Adams' Patent Self-Feeding Power Corn Shellers (widely known as the Sandwich Shellers), of sizes and capacities to suit all wants.

GREATLY IMPROVED THIS SEASON.

FARM HORSE POWERS of all sizes and most advantageous forms. HAND SHELLERS of highest grade of excellence in material and manufacture. Send for Illustrated Circulars.

J. P. ADAMS, Secretary.

A NEW BOOK FOR FARMERS.

"Carrots, Mangolds and Sugar Beets. What kinds to raise, how to raise, and how to feed." By mail, 30 cents. Also, my three works, on "Cabbages, and How to Grow Them," "Squashes, and How to Grow Them," "Onions, and How to Grow Them." Full of just such minute details as farmers want. Each, 30 cents, by mail. My large Illustrated Seed Catalogue *free* to all.

JAMES J. H. GREGORY, Marblehead, Mass.

The "Eclipse" Victorious

(See Centennial Judges' Report.)

STRONGEST WIND MILL MADE.

Tested 10 years. Thousands in use. A solid wheel without joints. Produces 15 per cent. more power, and will not blow away.

WE BUILD 13 SIZES MILLS for pumping and power purposes. Illustrated Circulars free.

Eclipse Wind Mill Co., Beloit, Wis.

Fitzhugh American Hay Elevator.

The greatest labor-saving machine in use: will do more work in the same time and space than any other machine of the kind manufactured. Is very durable, easily put up and operated, and has the capacity of hoisting 2,000 lbs. and carrying it back any distance required. It has the merit of being readily adapted to any kind of a building. It has been awarded premiums at a great number of State and County Fairs, and received the highest prize—a Diploma and Medal—at the Centennial Exhibition—as the simplest and best of its kind. Exhibit shipped to Paris Exhibition. Over 5,000 have been sold since Sept. 1st, 1874, which have given entire satisfaction. A price list and full particulars, with instructions how to put up and operate, will be sent on application to the Patentee and Manufacturer,

Price $12.00. J. R. FITZHUGH, 1708 Barker St., Philadelphia, Pa.

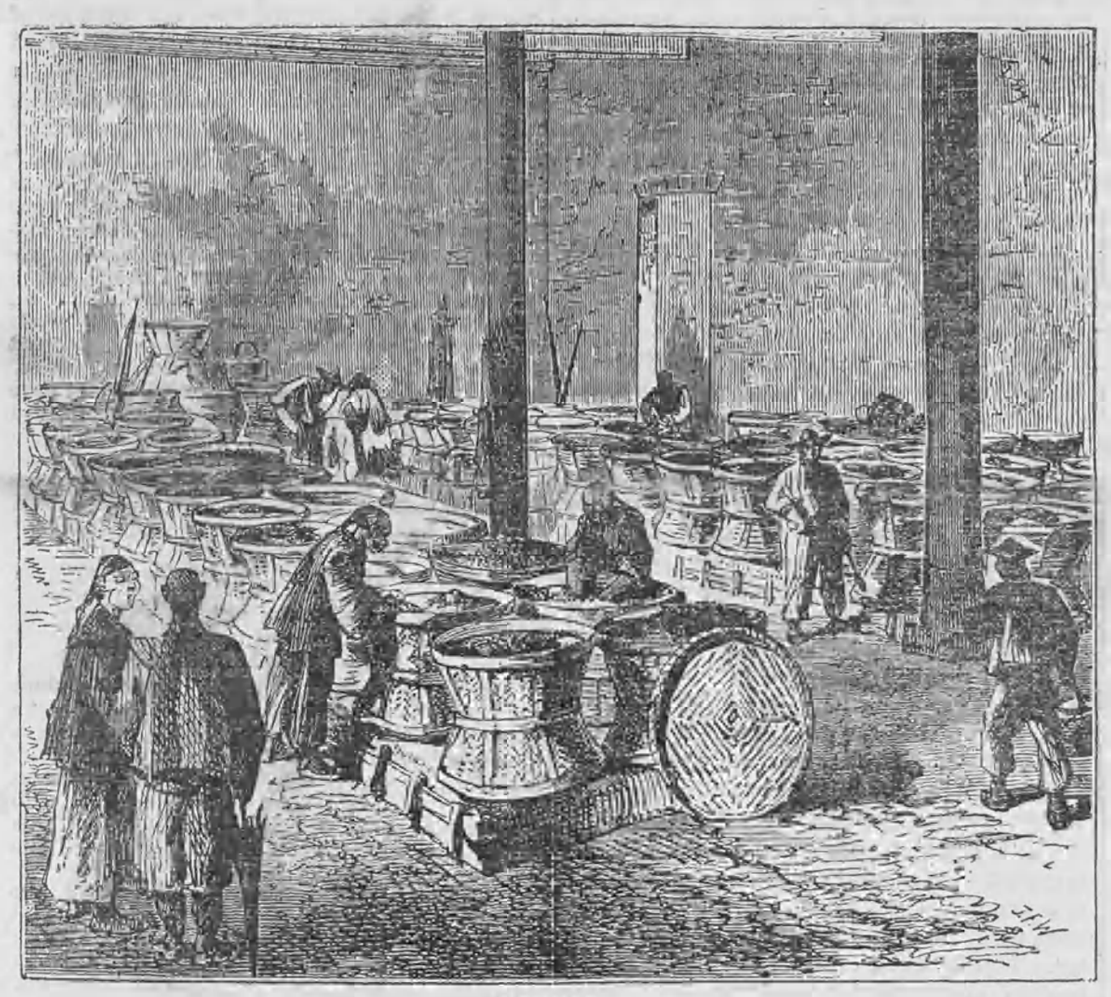
THE TEA PLANT AND ITS PRODUCT.

Besides the natural curiosity felt with regard to a plant whose product enters so largely into the daily consumption of all civilized countries, special attention has lately been attracted to the tea plant among us by the efforts of the Commissioner of Agriculture to introduce its cultivation among the ordinary branches of industry in those parts of the United States favorable to its growth. With this view a hundred thousand plants have been already raised under his direction in the national conservatories at Washington, and are intended for free distribution for experimental purposes throughout the country. Already numerous experiments in its cultivation have been made in different States, notably by Dr. Smith of Greenville, South Carolina, whose labors as well as those of others show that there are localities in the Southern States well adapted to the production of excellent tea, and that its profitable production in this country is merely a question of the price of labor. On the Pacific Coast where the climate is especially favorable for broad-leaved evergreens, both native and exotic, the tea plant flourishes much farther north than at the East, but even there a recent experiment in its culture undertaken by a colony of Japanese has been attended with poor results. Although our hopes of its remunerative cultivation in this country are by no means sanguine, solely



Drying.

PREPARATION OF TEA.

on account of the cost of labor, still so long as there is any reasonable doubt on a matter of such high importance, perhaps it is well that the question is about to be tested by the only decisive means—numerous experiments under various conditions of soil, climate and treatment.

The early

HISTORY OF THE TEA PLANT.

is shrouded in the mists that envelop all remote time among semi-barbarous nations, nor is its original country certainly known. It has been found growing quite wild in Assam and was cultivated in China so far back that no account remains of its first introduction. That its use in India is comparatively recent is inferred from the fact that there is no name for the plant or its product in Sanskrit, the ancient language of that country. It was introduced into Europe by the Portuguese early in the 16th century, by the Dutch a century later, and in 1664 the English East India Company made the Queen of England a magnificent present of two pounds of tea. The first considerable importation into that country was made three years later in 1667, when the same Company, which held a monopoly of the traffic until 1834, imported 4,713 pounds which was sold at the rate of from $30 to $50 a pound, and supplied all demands for several years. Considerable difference between this early importation and that of 1877, which amounted to 1,880,000 pounds! The Chinese districts which supply the export-demand lie between latitude 25° and 35° North. It has long been extensively cultivated in Japan, and lately very large exports have been made from that country. The British Government strongly encourages its cultivation in various parts of India, from which large supplies are annually shipped to England. It is also cultivated in Java and Penang, and, about 1850, the plant was introduced into Brazil. Great hopes were at first entertained of its extensive culture there by means of Chinese Cooly labor, but of late years little mention has been made of the results.

THE TEA PLANT—SEE CUT.

is an evergreen shrub with long, leathery, thin and very hard leaves of a rich dark green, not unlike those of the laurestinus. In November it produces, in China, a profusion of single white flowers, which are axillary and nodding, and though only an inch across, closely resemble those of a single camellia. Usually there are five sepals and petals and numerous stamens, while the fruit or pod is generally three-celled with a single large seed in each cell. The plant in its wild state is a bushy shrub, sometimes a tall tree, but in cultivation it is kept pruned down to a light of five feet. Like other plants long in cultivation, tea has produced several marked varieties which have sometimes been described as distinct species, but botanists generally agree that these all belong to one species, the *Camellia Thea*, and that the difference in size and appearance is mainly due to differences in soil, climate, mode of culture and the preparation given to the leaves. Tea produced on the hills differs from that on the low-lands and that which receives but little care is inferior to that which has been highly cultivated.

For the

CULTIVATION

of the tea plant almost any good arable soil, free from stagnant moisture, is well adapted. In some places the land is enriched with litter, sewage—always carefully saved in China—or with other fertilizers. The seeds are gathered in November, but are not properly ripe until the next autumn. They are then kept in sand until the following spring when they are sown, commonly in seed-beds, but sometimes in rows where the plants are to grow. In the former case the seedlings when a year old are planted out in rows from three to six feet apart each way. When the plants are about 18 inches high, the leading shoots are pinched to induce them to become bushy. They yield a small picking in the third year, and attain their maximum yield in the eighth or tenth, after which they deteriorate and give way to young plants. The average yield per acre is from 300 to 400 pounds according to the locality, but it requires about four pounds of fresh leaves to make one pound of dried tea.

The earliest

PICKING,

about the first of April, consists of the buds and the very youngest leaves, a second gathering about the end of the month, or early in May, consists of leaves more fully developed and yields the most important crop. An inferior quality of leaf is gathered in July, and in some localities another picking of old and poor leaves is made still later. The picker has a basket slung by a cord around his neck, to leave both hands at liberty. With one hand he holds the shoot, and breaks off the blade of the leaf with the other; for except in the earliest picking of the very young leaves, no portion of the leaf-stalk must be gathered with the finer kinds of tea. As the work proceeds, the picker frequently turns the leaves with the hand so as to prevent the lower ones from fermenting, which would spoil the whole plucking. With the late pickings the leaf and leaf-stalk are plucked together and separated, if at all, in

THE PROCESS OF PREPARATION.

This differs according to the various kinds of tea to be produced and the locality, for each part of the country has traditional methods of treatment supposed to be necessary to produce the best results. In all, however, the main object is to facilitate desiccation and prevent fermentation. With this end in view, so soon as the leaves are plucked they are exposed in shallow baskets to the sun and air which wither and partly dry them. Having been straightway removed to the tea-house and there allowed to cool, they are thrice beaten for ten minutes, at intervals of half an hour, by clapping them between the hands, throwing them up and letting them fall. This, together with subsequent rolling and heating, is necessary to develop from the resinous substance of the leaf the essential oil that gives to tea its peculiar aroma. They are then placed in small quantities in shallow copper or iron pans, heated by charcoal or other fuel and rapidly stirred. At the proper moment they are swept out into other appropriate vessels or upon a table where other workmen rub the leaves between their hands in order to roll them into the form they finally retain. This is a very delicate operation and "the art of rolling" is held in high repute among the very practical Celestials. This alternate heating and rolling is repeated two or even three times. They are then placed in drying baskets, two and a half feet high, two feet in diameter at top and bottom and eighteen inches in the middle where bamboo sieves are stretched across, on which the tea is spread in thin layers. The whole is then placed to dry over a charcoal fire, which must give off no smoke, and be carefully regulated. The choicer teas are spread out on a table or placed in shallow bamboo trays to be assorted before packing; all imperfectly rolled leaves are removed and the dust and fragments sifted out. The chest with its leaden lining being ready, and the amount of tea for each weighed, one bare-footed Mongolian gets into it, another gradually pours in the leaves, which the first treads down firmly, and as soon as the case is full the leaden cover is soldered down, and the tea is ready for shipment to the Western Barbarians.

Of the

CHINESE TEAS

the principal black sorts are bohea, congou, souchong, caper, oolong and pekoe. Of these bohea is the coarsest, and pekoe the finest, consisting of the very youngest leaves of the first picking. When these are so young that they are still clothed with down, they constitute the flowery pekoe, a choice sort not very often found in the farmerine's teapot. Among the green teas are twankay, hyson skin, young hyson, hyson, imperial, and gunpowder. The gunpowder in green tea corresponds with the pekoe in black and, like that, is from the first gathering. Imperial, hyson, and young hyson, are grades made from the second and third pickings, while the inferior, light leaves, winnowed from the hysons, make the hyson skin, the chief market for which is found in this country. The finest teas, both black and green, are seldom seen in the United States, as transportation in the hold of a vessel causes fermentation which destroys their quality. Most of the crops of these luxuries is consumed either by wealthy Chinese or exported overland to Russia.

The evaporation of water from the leaf and the drying process change its color to brown or black. The green teas of commerce are merely black teas dyed by a preparation of Prussian blue and gypsum, applied at the last heating. The green tea used in China is from the first picking, and is never dyed and seldom or never exported.

The

ADULTERATIONS

to which tea is subjected are innumerable, from the "lie tea" concocted in China out of the dust of tea, rice-husks etc. by the aid of gum, to the ingenious product of the leaves of the sloe, hawthorn, elder, plane, poplar and other trees which has, not infrequently, been palmed off on simple humanity by the grocers of England and the United States. To escape these deleterious concoctions, if for no other reason, it would be a blessing should tea culture prove remuneratively practical among us, but apart from the tedious labor of picking the crop leaf by leaf, before it is ready for use there is a multiplicity of other small operations needed to prepare the different kinds. These the limits of this sketch prevent us from particularizing here, but all together they consume so much time as to render it a very doubtful problem whether tea can be profitably cultivated in this country until inventive ingenity shall have devised some mechanical contrivance to supersede human manipulations.

The cuts that illustrate this article will give our readers a fair idea of the tea plant—page 217—its cultivation and manufacture.

Farm Topics.

NOTES FROM MAPLEWOOD FARM.

HECTOR BERTRAM.

APPLICATION OF MANURE.

The subject of the application of manure to the soil in a manner to receive the greatest benefit therefrom, has ever been, and probably ever will be, one of much dispute among farmers. Speaking for myself, I would seldom apply manure to spring crops. If we would receive the full benefit of its fertilizing qualities, we must have it in a well-rotted condition that it may be readily commingled with the soil. Drawn directly upon the ground from the yards in spring, this result cannot be obtained. The coarse manure should be drawn out in spring and piled in some convenient place until fall, adding from time to time, as convenient, the refuse from the stables, the piggeries, and the leach. By seeding time in the fall, the whole mass has become well-rotted and in fit condition for application as a top-dressing for wheat, the crop that really needs the assistance of manure more than any other of the cereals. We derive more benefit from the application of manure in fall, than in spring. The late rains and snows of winter carry the fertilizing qualities into the soil, while the hot sun of summer draws these properties away from the plants they are calculated to nourish. The finer scrapings of the yards may be applied to the land in spring—no doubt with good results.

I consider the best manner of doing this to be an application directly after plowing, harrowing it well into the soil with the grain. If it is spread upon the surface after sowing, we lose nearly or quite half the nutritive elements. Where it becomes advisable—or necessary—for us to apply in the spring the manure accumulated in the yards during the winter, I always do so before plowing. The benefit derived from its use in this manner, is not so speedy, but more permanent. I would *never* apply barn-yard manure to corn ground. The seed of barn-grass, smart-weed, and other noxious weeds are nearly always mixed with it, making it unadvisable to do so. I always endeavor to have a clean clover sod to turn each spring for corn. Corn planted after clover requires much less cultivation, and I scarcely ever fail to secure a first-rate crop. I have heard men affirm that you could not make ground too rich for corn; but such is not the case. Where too much manure is applied, there is an immense growth of stalks, but they are usually scantily eared. If I have a good clover sod, and plenty of ashes and hen manure, I can raise good corn on nearly any ground. The assertion may seem broad, yet, nevertheless it is true. You never see a good growth of clover on poor land, and the elements essential to the free growth of clover are likewise necessary for corn. If the manure is plowed in every spring, the land will be kept in good condition—provided enough is applied—for any crop of grain, for an indefinite number of years, yet I would never raise more than three successive crops without seeding. This is the great secret of keeping the land up, in any country. We can keep a small quantity of land in good condition by the use of manure; but when it extends to a hundred or more acres, this becomes impossible, almost. By a careful and systematic saving of all the extra straw, leaves, etc., the manure heap may be largely increased during the year, and turned to advandage in fall as a top-dressing. By applying it in the spring, we cannot turn these to so good an account. Swamp muck and plaster, scattered in the yards or stables, to absorb the urine, are valuable additions. To sum up: for spring crops let the manure either be plowed under or applied before sowing and well harrowed in with the crop. Scattered on the surface after sowing, there is much of the ammonia lost in the atmosphere. A neighbor experimented with manure last spring. After the grain—barley—was sprouted, he drew out barn-yard manure and scattered over the surface. In reply to my remonstrance, he assured me that "I'd see," and I *did* see; his grain came up yellow and sickly, actually rotted by the contact of the young plants with the manure. From an acre, he harvested five bushels of barn-grass, and other foul seed—and barley.

SPRING SOWING.

The time has come when spring crops demand our attention. Which varieties can we sow with best results, and most profit to ourselves? In my opinion every farmer of any pretensions, should cultivate one variety mainly, whether of wheat, barley, or oats. I never could convince myself that the two last were really profitable. The idea that one must sow a *little* of each, is a poor one. If we devote our attention to one variety we are better acquainted with its peculiarities and the most successful manner of cultivating it. To be successful with any spring crop we must get it in early, as a general rule be it understood. Occasionally, it is true, a crop sown late does well, yet we lose by making it a practice. I was once acquainted with a farmer who became repeatedly a loser by this habit. A crop of oats once sown by him the first of June, yielded enormously, and thereafter he became known as the "afternoon man," from his partiality for sowing grain late. Yet, mark you, he never was heard to brag on any crop but one, although oats do better when sown late than either spring wheat or barley. These should be sown just as early as the state of the soil will admit. By early sowing I don't mean in March, or the first few days of a cold wet April, but when the soil becomes dry and warm, so that it can be pulverized, and is of the right temperature for the grain to sprout immediately and grow rapidly. We lose by cultivating the soil too early, even more than by cultivating it too late; for besides the loss by an inferior crop, the good qualities of the soil are greatly diminished. Spring wheat alone is an exception. This *must* be sown early.

Rolling after sowing I have become convinced is of great importance. The earth is pressed firmly about the seed, causing it to sprout sooner and more evenly. Moreover on stony ground where the grain is cut either with a reaper or cradle, the surface is left smooth, the smaller obstructions crushed down so that they are no impediment to the sickle-bar, or hand-rake. Where grass-seed is sown in spring, it should be done either before the last harrowing or "bushed in" afterwards. When sown directly on the surface and not covered, much of it will never germinate, especially if there should be no heavy showers immediately after sowing. The best time to sow grass-seed upon winter wheat is, in my opinion, when the last snow of spring is melting. As it melts and is absorbed by the soil, the moisture carries the seed with it into the earth sufficiently deep for germination.

PUMPKIN SEEDS FOR MILCH COWS AGAIN.

In a recent number of the RURAL, "Clinton" ridicules the idea of pumpkins or their seeds being injurious to milch cows. He states that for years he and his father fed them to their cattle with no bad results, while he, himself esteemed the seed a great luxury. I would like to inquire whether he ever kept geese and, if so, whether he ever allowed them to eat the seed, and with what results. Or did he ever feed part of his cows pumpkins, and for the remainder, substitute carrots, beets, or cornstalks? I have talked with many farmers on the subject, and four-fifths of them assert, with me, that pumpkins, as food for milch cows, are not a success. They are excellent for fattening purposes, but diminish rather than increase the flow of milk.

FARM NOTES.

S. RUFUS MASON.

DEEP OR SHALLOW PLOWING.

Did any one ever hear of the temple of Janus, that stood in the center of a plain? It had a hundred sides, no two alike, approached by a hundred roads, each of which ended butt up against its special side, with no way of retreat but to go straight back again. No pilgrim to this shrine ever saw but one side, and his "tale of wonder" when he got home again was of that alone.

"Deep or shallow plowing" is a myth of the sort. If a farmer finds shallow work the best on his farm, let him show his sense by sticking to it; but if another has proved deep furrows the best for him, don't let us try to argue him out of it. What is the use of a hundred men standing around a temple and scolding each other while none of them can see any of the others?

EXPERIMENTAL FARMING.

All knowledge is gained on a farm by experiment. It may be made very profitable or very ruinous. Now, in the spring, is the time to try on any unsatisfactory piece of land, different methods of developing its capabilities. A little deeper plowing, a little more fertilizing, a coat of clover or buckwheat plowed under, liming, plastering, hoed crops or sowed crops, grass top-dressed, or even frequent cultivation with no crop, are modes applicable to most varieties of land sickness. If the trial is made on a small surface there can be but a small loss at the worst, while extensive experiments are sure to "make or break" one.

THE FEET OF HORSES.

"No foot, no horse"; although every farmer knows this maxim, it seems as if many (by the size they keep their animals feet at) expected to double their teams by a contrary interpretation of it. A hoof spread out of all likeness to its original form, cracked nearly to the quick, the frog pared till it is as thin as paper; the sole cut away till the frog touches the ground at every step, toes turned in, and sore knees from frequent stumbles, are no credit to a farmer now-a-days. If every man who is guilty of causing the above defects, were compelled to keep his own feet in a similar manner, there would be a revolution somewhere. It is not necessary to employ a farrier to trim a horse's foot. A plank to stand on, a sharp two-inch chisel, and a good mallet, in the hands of a careful man will, if used once a month, keep hoofs in perfect order and improve them constantly.

FARMERS' MAXIMS.

Slow and sure, if you are poor. Small ventures small risk. The best of seed is what you need. If you do your work well, the profits will tell. Gentle boss, gentle beast.

"Keep what you've got,
And get what you can,
Honestly, if you'd be a man."

"When you go out to buy,
Shut your pocket and open your eye."

Farm Economy.

EXHAUSTION OF SOILS.

J. B. LAWES,
Rothamsted, England.

THERE is no subject on which more difference of opinion exists than on that relating to the exhaustion of soils; but this is not surprising when we consider how extremely complicated it is.

The late BARON LIEBIG who employed abilities of the very highest order in the inquiry, gave it as his opinion that the exhaustion of the soils of England was due to a deficiency of phosphate of lime, and further, that if a cheap and abundant source of this substance could be discovered, we might grow all the wheat required by our population. For the last quarter of a century our farmers have had at their disposal abundant supplies of phosphate of lime: for a few cents they can purchase all that is contained in a bushel of wheat. Each year, however, finds us importing more and more corn, and at the present time fully one-half the population of these Islands is supported entirely upon bread made from foreign wheat. It was also the opinion of BARON LIEBIG, and this opinion is very prevalent at the present day, that the constituents of the soil which are removed by crops should be returned to it in some form of manure or chemical salt. Such a procedure would doubtless be an effectual remedy for the exhaustion of soils, but it ignores the fact for which I am disposed to contend, that soils are meant to be exhausted. All soils which have never been cultivated by man possess a natural or standard fertility belonging to their geological formation, and a more readily available fertility arising from the accumulation of living and decayed vegetable matter on their surface. The latter state of fertility has long ceased to exist in England, while the former is as distinct as ever after centuries of cultivation, and is appropriately designated by farmers under such terms as "very fertile," "rich" "poor" "hungry" etc.

Now the most vehement advocate for the non-exhaustion of the soil would hardly be disposed to contend that the surplus fertility of of a newly cleared settlement in the States does not form part of the natural wealth of the country; or, assuming that it takes the form of 100 bushels of maize on the acre and is followed by two or three more of large but probably diminishing crops, that such an exhaustion of the soil is not perfectly legitimate; also that in such operations, to attempt to restore to the soil the constituents removed by the crops would be absurd. Now it appears to me that from the starting point where I have assumed that the removal of plant-food from the soil without its restoration, or, as it is commonly called, the exhaustion of the soil, is perfectly legitimate, there is none in the successive stages of such exhaustion at which it is possible to say that it ought to be arrested. Judging from my own soil which has been subjected to the most rigid process of exhaustion that could be brought to bear upon it, I should say that soils have a wonderful power of resisting exhaustion. A few years of corn-growing without manure would, I used to think in the early days of my experiments, be sufficient to bring its corn-producing powers to a stand-still, but at the end of nearly forty years we are discussing whether the decline in produce which the last of two equal periods of years shows over the first period, is due to greater exhaustion, or to a larger proportion of unfavorable seasons in the latter half of the period than in the former.

In the United States where the owner of the soil is also the cultivator, the question with regard to the exhaustion, or the restoration of the fertility of a soil, is not complicated as it is in England, where the interests of the owner and of the cultivator of the land are conflicting. The United States' farmer probably pays but little regard to the effect which his operations in husbandry may have upon the soil at some far distant period. When he applies manure to his land it is with the idea and hope that the increased produce will repay the cost of the operation. A visit to the United States and an inspection of its agriculture, although it would add immensely to my general knowledge, would add little or nothing to what I already know in regard to the food of plants and the exhaustion of soils. Maize is the great crop of the States and the principal food of the nation, but it is quite evident to me that the great value of maize as a food, depends upon the starch it contains, and that it is one of the same botanical order of plants as wheat and barley, taking up, and exhausting the soil of, the same ingredients as the other cereal grains.

What we really want in order to advance our knowledge with regard to the exhaustion of soils are careful and accurate statistics of the amount of produce carried off from farms and of the manures brought on to them for a considerable number of years. If such figures could be obtained over a sufficient area of land in the various geological formations, we might be able to calculate the rate of exhaustion which each soil is capable of bearing without apparent injury, but the general statistics of a country are of no avail in such an investigation as this. We might indeed arrive at some general idea of the collective amount of ingredients removed from the soil of a country or State, but we should only obtain the sum of the whole. One farm or district might be increasing the fertility of the soil, while another might be greatly reducing it, and the special points of interest in the two would thus be lost in the general average. Accurate statistics not being attainable, I have been endeavoring to make use of such materials as we do possess in order to compare the agriculture of the United States with that of England. Independent of several difficulties of a minor nature, which will be apparent as I proceed, there are two of a very serious character in the way of such an undertaking. In this country we have no statistics of produce. The agricultural returns for the last ten years do indeed give us the acreage of the various crops grown and also the number of the various kinds of stock kept, but no attempt has been made to ascertain the yield of the various crops; we are therefore left to form the best conclusions we can on the subject. The statistics of the agriculture of the United States are, on the other hand, most ample, and I take this opportunity of returning my thanks to the Head of that Department for his kindness in furnishing me with a set of this most valuable publication. The difficulty of making use of these statistics in the manner I first intended, arises from the vast changes in the agriculture of the United States which take place in comparatively small periods of time. Those acquainted with agriculture are fully aware that, owing to the influence of seasons, any general conclusions derived from the produce of one year only are of little value. An average of 10 years is by no means too long a period to adopt, and in the field experiments on my farm, we consider that 20 years is not too long a period in writing upon any experiments on field produce.

Taking the United States statistics for 10 years, from 1866 to 1875, as the latest in my possession, I find that during that period such vast tracts of new land have been brought into cultivation that for my purpose these statistics are not suitable. An increase of 10 million acres of Indian corn brought into cultivation, of a still larger quantity of wheat, besides an increase of all the other crops grown, except buckwheat, gives us some notion as regards the wonderful energies of the inhabitants of the United States, and at the same time leaves little doubt as to the cause of the depressed state of the agricultural interest in the United States and in this country. The State of New York, however, may be brought into comparison with a country like England, as the fluctuations in its agriculture in a limited period are not of that startling nature which characterizes the agriculture of the United States in general. I shall therefore take the agriculture of the State of New York in the following comparisons with that of England. In our statistics of agriculture a line is drawn through the centre of England, dividing it into two districts; one, containg 21 counties, is called the western and grazing district; the other, the eastern or corn district, also containing 21 counties. As the grazing district more nearly resembles New York State in its agricultural character, I propose to adopt that district in my remarks.

According to the census of 1870 the improved land in the State of New York was a little over 15½ million acres. In the 10 years of 1866-75 the amount of land under hay, potatoes and corn varied from six to a little over eight million acres. These fluctuations, although large, do not appear to be due to any change in the area of improved land, but rather to the influence of prices, reducing or increasing the area of cultivation. In 1866 the area under these crops was 8⅛ million acres: from this point it declined gradually until the year 1871, when it reached the lowest point of 6.16 million acres; advancing again steadily until it reached nearly 8 million acres in 1875. The number of acres of land contained in the 21 grazing counties of England is 12,908,000, or nearly 13 millions. This includes all crops, fallows and pasture, but excludes mountain land and heaths.

During 10 years but little change has taken place in the amount of the various crops grown. Before, however, instituting any comparison between the farming of the State of New York and that of the 21 grazing counties of England, it will be as well to notice some of the most marked points of difference between the farmers of the two countries, and their methods of farming. The New York farmer is the owner of the land, he can do what he likes, cultivate what crops he pleases, adopt whatever system of cultivation he thinks most condusive to his interests. He owns, on an average, 103 acres, of which about 73 are improved land. The greater part of the farm work is done by himself and his family; the amount of wages paid not exceeding, on an average, $2.20 per acre yearly. I have been informed on very good authority, and I can quite believe it, that he works much harder than his brother in England; still his life is one of complete independence and he calls no man his master.

In common, however, with the English farmer, he has been recently suffering from low prices, and much as he may rejoice in the progress of his country, he may possibly think that nearly 30 million acres of land brought into cultivation in ten years may have a somewhat depressing effect upon the value of his own crops. Three of the crops cultivated in New York State are not cultivated in England; viz Maize, the great crop of the United States, which cannot be profitably grown in England for want of sufficient warmth in the autumn months; Rye and Buckwheat. These used to be grown here but have given place to more valuable products. All other crops are grown in both countries. Mangolds and Turnips, which constitute a distinct feature in English agriculture, are not noticed in the general reports. The "New York Transactions" which goes into more minute details and tells us that Sullivan Co. produced 6 pounds of dried apples in one year, also informs us that 4 or 5 thousand acres of Turnips are grown in New York State.

The English farmer does not own the soil; for a fixed annual payment he holds it by lease, agreement, or, in the absence of any agreement, by custom, which settles what he may and may not do; so that he has but little liberty of action. Generally he may not grow two white-straw crops in succession, and he may not sell hay, straw, or roots. These restrictions which were established at a time when nothing was known respecting the food of plants, and when fertility could not be purchased, are much less necessary now; and I have recently made an attempt to get them altered and modified. With distinctions so great between the owner of the land acting with perfect freedom on one side the Atlantic, and the tenant bound by numerous restrictions on the other side, I was somewhat surprised to find so general an agreement on many points as the following table exhibits:

TABLE 1.

Showing the number of acres of land under the various crops in the State of New York, on an average of 10 years, 1866–75, compared with the crops in 21 counties of England called Grazing Counties; also the number in each crop in 100 acres.

	State of New York Acres.	England. Grazing Counties. Acres.	State of New York Per cent.	England. Grazing Counties. Per cent.
Corn crops	2,970,000	2,761,443	19.	21.4
Potatoes	269,000	149,000	1.72	1.4
Other green crops.		978,317	0.	7.6
Fallow	156,000	251,459	1.	1.9
Hay	3,910,000	2,845,541	25.	22.
Not for Hay	8,305,000	5,882,612	53.2	45.6
Total	15,610,000	12,896,872	99.92	99.9

The State of New York contains 2½ million acres more than the 21 English grazing counties; in order therefore to bring them to an equal standard for comparison we must look at that part of the table which shows the amount of the various crops in every 100 acres. It will be seen that the English farmer grows rather less than 2½ per cent. more corn* than the New York farmer and that they have almost the same amount of land in potatoes and fallow. Of other green crops, such as mangolds, turnips and vetches, he grows 7⅓ acres in the 100, while the New York farmer grows an area too small to be appreciable. The latter has, however, a larger acreage of land not for hay, and if we add to the 45⅓ English acres not for hay, the 7⅓ acres of green crops which are always consumed on the farm, we have a close agreement between the two countries with regard to the number of acres employed in feeding stock. This will be seen in the following table:

NEW YORK.		ENGLAND.	
	Acres pr ct.		Acres pr ct.
Not for Hay	53	Not for Hay	45⅓
		Green crops	7⅓
	53		53

With regard to the amount of land which is in permanent pasture, that is to say, land which is never plowed up, there is in the 12-9 million acres of the English grazing counties 7 million acres, or 56 per cent of the whole; but I have searched in vain through the New York transactions for some information relating to permanent pasture in that district. In the returns for 1865 it is stated that 6 million acres were in pasture in the previous year, and about the same quantity in meadow; but this does not give the information I require. The only reference to permanent pasture occurs in connection with some trials of mowing machines. It is there stated that the meadows had not been broken up during Mr. MONSON'S recollection, but how far back his recollection extended is not mentioned. The botanical analysis of the herbage of the meadow is given, and the number of species growing is stated to be unusually large. I find there are, in all, 52 species of plants, of which 10 are grasses, 2 clovers, and 40 are weeds. On the Rothamsted pasture which has been unmanured for 22 years, and from which a hay crop has been carried off every year, there were at the commencement 50 species of plants, of which 16 were grasses, 4 were clovers, and 30 were weeds; and there has been little variation in the amount of species during the whole of the period. On an adjoining piece of land which started with the 50 species, but which has received a very large quantity of chemical salts every year, the change in the herbage has been very great; the weeds and clover have almost disappeared, and of the original 50 species only 16 remained at the end of 16 years. Of these 16, nine were in quantities of only a few pounds per acre, while two grasses, the Dactylis, or Cock's-foot, and Alopecurus or Meadow Fox-tail, which in the original pasture occupied quite an insignificant position, now constituted the greater bulk of the crop. A professed botanist who makes a complete separation of all the plants in each experiment every 5 years, made the weight of these two grasses alone to be 1½ tons of hay per acre. The Cock's-foot and Fox-tail are considered to be amongst the most nutritious of our grasses; thus we have a striking illustration in this experiment of the power of the better sort of plants, under the influence of an abundant supply of food, to drive out those of an inferior nature.

I am disposed to think that permanent pasture does not prevail extensively in the State of New York, but that after one or more years the land is broken up. In the English grazing counties, 56 acres out of the 100 being always grass, we have 44 under arable cultivation, of which one-half is in corn. The greater part of the grain is sold, and also the potatoes. The remainder of the produce is used directly or indirectly to produce meat or other animal products. The New York statistics afford no information respecting the quantity of hay sold off or consumed on the land, nor indeed do those of my own country; but while I can fill up the blank from personal knowledge in one case, I have nothing to guide me in the other. In the following table is given the amount of live stock kept in the two countries over the adopted area, and also the calculated quantity kept per 100 acres in each country.

TABLE 2.

Showing the amount of stock kept in the State of New York, in 1875, on an area of 15.61 million acres; and in the 21 Grazing Counties of England, on an area of 12.89 million acres: also the number calculated in 100 acres.

	State of New York	England. Grazing Counties.	State of New York 100 acres.	England. Grazing Counties. 100 acres.
Horses	697,100	586,739	4.4	4.1
Cattle	2,139,500	2,921,282	13.8	20.
Sheep	1,935,500	9,697,359	12.5	75.
Pigs	563,700	1,068,734	3.6	8.

With the exception of horses, of which the quantity kept for 100 acres is rather larger in New York State than in England, the amount of stock kept in England is very much larger; in sheep more especially the difference is very great and requires some correction. The statistics of Great Britain comprise all the cultivated and pasture land and exclude mountain, heath and other waste land, but they include the whole of the stock wherever kept. The returns of stock in a country in which there is any large area of mountain or waste land show, therefore, more stock, principally sheep, than actually derive their support from the land included in the cultivated acreage. The only means we have of correcting this error is to take as a basis the amount of stock kept in counties where little or no waste land exists, and to deduct any excess which we find in counties where there is much waste land. In a majority of the 21 counties which are included in the grazing districts there are practically no waste lands upon which stock are kept, and several of these keep 20 oxen and 100 sheep per 100 acres, which is more than the average; but those constitute the finest land in the country. Some of the northern counties which have much waste land, carry 133 to 138 sheep on the 100 acres; part of them are certainly fed on waste land, and possibly a reduction of from 10 to 15 sheep per 100 acres over the whole area would meet the case. I have no data to guide me in forming any opinion respecting the amount of stock kept upon the unimproved land in the State of New York. In the follow-

* The general reader may not be aware that the word Corn in England includes all kinds of cereals.

ing table will be seen the number of acres per cent. of each crop grown in the State of New York and in the 21 English grazing counties; also the average produce of each crop.

TABLE 3.

Showing the number of acres in each crop in 100 in the State of New York and in the 21 grazing counties in England; also the produce per acre of each crop.

	New York No. of acres.	England. No. of acres.	New York Produce per acre. Bushels.	England. Produce per acre. Bushels.	New York Total in bushels.	England. Total in bushels.
Maize.....	3.9	—	31.6	—	123.24	—
Wheat.....	3.9	9.8	14.	26.	54.6	254.8
Rye.....	1.4	—	14.2	—	19.88	—
Oats.....	6.7	5.	32.2	40.	215.74	200.
Barley.....	1.7	6.6	22.	30.	37.4	198.
Buckwheat....	1.4	—	20.	—	28.	—
Total.....	19.	21.4			478.86	652.8
Average.....	—	—			25.1	31.

The New York figures are calculated from an average of ten years, 1866-75; the average produce of the English counties is estimated from the best data I have at my command.

I made, some years ago, a very careful investigation of the amount of bread consumed by our population in order to arrive at the produce of our wheat crop; from this it would appear that our average produce per acre amounts to 28 bushels; but as the western half of the country is less adapted for the growth of wheat than the eastern half, I have considered the produce to be 26 bushels, or 2 bushels less. Similar estimates have been made for the other crops. According to the above table the State of New York grows 19 acres of corn in every 100 of improved land, averaging 25 bushels per acre, or 479 bushels altogether; six different sorts of crops being grown. The grazing counties of England grow 21½ acres of grain in every 100, averaging 31 bushels per acre, 653 bushels altogether; three different sorts of grain being grown.

In making any attempt to estimate the relative exhaustion of the soil in the two countries, it would be necessary to obtain a variety of information which I do not possess. The potatoes in England, for instance, are as a rule grown in the neighborhood of large towns or on the lines of railways where town-dung can be obtained, and I am disposed to think that all the soil ingredients taken up by the crop are replaced by the purchased manure which grows it. Artificial manures and purchased cattle foods are also largely employed in England, but it is impossible to say how much of the produce of the English soils is due to their use. The statistics of New York give no information respecting the amount of produce sold off, or consumed on the farms. Hay for instance exhausts the soil largely of mineral matter, especially potash, but no information is to be found with regard to the amount consumed or sold.

In attempting to construct a table, to show the amount of the more valuable ingredients of plant-food which are removed from the soil in the State of New York, I do so more to indicate how such questions will be treated by a future race of farmers, than for any other purpose. The data for the construction of such a table are not in existence, and consequently but little reliance can be placed in my figures. In the following table is given the amount per acre per annum of the three most important ingredients of plant-food; nitrogen, phosphoric acid and potash removed from the land in the State of New York, assuming that the crops grown are in accordance with the table of produce previously given. Being ignorant with regard to the amount of produce actually sold off the farm without restoration, I have constructed the table in various forms to show what would be the removal of these three substances, supposing that some crops were sold and others consumed. In order to ascertain the amount of manure ingredients removed in the animal products, I have taken from the census of 1870 the value of the animals killed in the State of New York, which I find to be $183 per 100 acres. Calculated at 4 cents per pound live-weight, this would give me the number of pounds sold. I have also from the same census-tables estimated the quantity of milk, butter and cheese produced; as however all these can be represented by milk, I think it better to found my calculations on milk alone. It is stated in the "New York Transactions" that the average produce of milk per cow per annum is 1,300 quarts; and as out of the 14 head of cattle kept on every 100 acres, 8 are cows, the quantity of milk is 14,400 quarts.

It will be seen by this table that the average amount of nitrogen removed in grain is 21½ pounds per acre, of phosphoric acid, 6¾ pounds and of potash, 5 pounds. In potatoes the amount of the two former substances is the same; but of potash, 8 pounds instead of 5 are removed by them. Hay removes a much larger amount of nitrogen than corn, and more than three times as much potash. Owing to my ignorance with regard to the number of acres required to keep live stock, I am unable to assign to each acre the constituents removed, I therefore give them altogether. There are 53 acres of pasture in every 100 in the State of New York; and if this area kept the stock, we should arrive at the amount of constituents removed per acre, by dividing the figures I give by 53; or, if the hay is consumed by the stock, by dividing these figures by 80.

TABLE 4.

Showing the amount of Nitrogen, Phosphoric Acid and Potash, in pounds, per acre, removed every year from the land, first, assuming that the grain, potatoes, meat and milk are sold off the farm, the straw and hay being consumed and returned to the land in manure; and secondly that the hay also is sold off the farm.

	Nitrogen. in pounds.	Phosphoric Acid. in pounds.	Potash. in pounds.
Removed per annum, in 19 acres of grain.....	21½	6¾	5
Do. in 19 acres grain, 1.74 acres potatoes.....	21½	7	8
Removed per acre of hay sold.....	35	9	17
Removed in live weight of animals and milk.	122	62	14½
Average per acre over 100 acres, if corn, potatoes, live-weight and milk sold.....	6	2¼	3
As above, with hay sold.....	14¼	4⅛	10½

In either case, it will be seen how exceedingly small is the amount of plant-food removed by animals and in their products. The last line but one gives the amount of nitrogen, phospheric acid and potash removed per acre per annum over the 100, assuming that all the corn, potatoes, live-stock and milk are sold off the farm, and the straw and hay consumed, or returned. The last line gives the same, with the hay sold instead of being consumed. The difference in the removal of these substances when the hay is sold, is very striking, showing plainly how much this crop exhausts the soil. It will, I fear, be some considerable time before figures like these become of any real value to practical farmers; the removal of a few more or less pounds of one substance or another over an acre of land being only bare facts which do not tell him what he wants to know; such as, whether his soil is becoming exhausted of these substances too rapidly; or whether one ingredient is being removed faster than others, relatively to the amount which his soil contains. Neither does it tell him whether it would pay to restore these constituents in some artificial form, nor which of them he should restore to the soil.

As portions of my farm are the only pieces of land in the world where the constituents of the crop removed have been estimated for a long period of years, it may be useful to give the figures obtained in one of the fields here for comparison with the New York figures. In 1840 a field of 14 acres which had been under ordinary arable cultivation for a century or more, was sown with barley unmanured, followed by unmanured crops of peas, wheat and oats. In 1844 and since, wheat has been grown for 34 years. Portions of the field have grown corn without the return of any manure whatever; no attempt has been made to increase the yield by deep plowing or subsoiling, and probably the land has not been stirred to the depth of more than 3 or 4 inches from the surface. Careful analysis have been made of the products obtained; and recently the ash of the mixed straw and grain of the last 10 years, and of the previous 10 years produce, have been carefully analysed.

In the following table I have given the amount of nitrogen, phosphoric acid and potash removed per acre per annum in the State of New York and over the unmanured acre of Rothamsted land, taking the average of the last 20 years.

	Nitrogen. Pounds per acre.	Phosphoric Acid. Pounds per acre.	Potash. Pounds per acre.
NEW YORK.			
Corn, hay, meat and milk sold: straw retained.....	14½	4⅛	10¼
ROTHAMSTED.			
Unmanured land	20	10¼	17

It will be seen by this table that the removal of the three constituents of plant-food from the Rothamsted soil is very much larger than from the soil in the State of New York; and it would be larger at Rothamsted even if I had calculated the New York soil as selling off the whole produce, grain and straw, hay, meat and milk, and restoring nothing. I am disposed therefore to think that destruction of weeds and more careful cultivation would be quite as efficacious in increasing the produce of the State of New York crops as the employment of artificial manures.

As far as practicable the land at Rothamsted is kept free from weeds; the wheat can therefore take up all the available plant-food in it. With how many natives of the soil has the wheat grown in the State of New York to contend for its share of food? As far as I can judge, exhaustion of the soils in your State is not taking place to any alarming extent. There are various processes by which a greater produce can be obtained from a soil, but the selection of these must in all cases depend on a variety of local circumstances, such as the price of labor, the value of the product sold, the cost of the various processes to be employed, etc. A person therefore writing from a distance would be almost certain to commit serious errors if he attempted to profer advice on this complicated subject.

Floricultural.

WILD PLANTS AS GARDEN FLOWERS.

No. 2.

WILLIAM FALCONER.

In the following lists I have classified our Wild Plants, as regards time of blooming and shades of color, from practical observation, and as nearly as is consistent with the space at my command. They are also compiled, just as this article is written, with a view to suit our Northern climate, where they are emphatically hardy plants. Indeed, with a very few exceptions, we cultivate them all at the Botanic Garden here. True, we protect most of our plants with a few leaves or some rubbish in winter, no matter be they ever so hardy, because we find them benefited thereby.

SPRING.

WHITE.—Anemone nemorosa, Wood Anemone; Carex Fraseriana, Fraser's Sedge; Cerastium arvense, Mouse-ear Chickweed; Convallaria majalis, Lily-of-the-Valley; Erigeron flagellare, Creeping Fleabane; Hepatica acutiloba, Sharp-lobed Liver-leaf; Jeffersonia diphylla, Twin-leaf; Podophyllum peltatum, Mandrake; Polygonatum giganteum, Soloman's Seal; P. biflorum; Sanguinaria Canadensis, Bloodroot; Sedum ternatum; Smilacina bifolia, False Soloman's Seal; Thalictrum anemonoides, Rue Anemone; Tiarella cordifolia, False Mitre-wort; Trientalis Americana, Star Flower; Trillium grandiflorum, Large-flowered Birthroot; T. nivale, Dwarf Birthroot.

RED AND PURPLE.—Aquilegia Canadensis, Canadian Columbine; Claytonia Virginica, Spring Beauty; Cypripedium acaule, Lady's-Slipper; Dodecatheon Meadia, Shooting-star; Dicentra eximia; Geranium maculatum, Spotted Cranesbill; Geum triflorum, Rocky-Mountain Avens; Phlox amœna; P. reptans; P. subulata, Moss-Pink; Trillium erectum, Purple Birthroot; T. recurvatum; T. sessile.

BLUE.—Anemone patens, var. Nuttalliana, Pasque-Flower; Aquilegia cœrulea, Rocky Mountain Blue Columbine; Camassia Fraseri, Fraser's Squill; Delphinium tricorne, Dwarf Larkspur; Hepatica triloba, Liver-Leaf; Houstonia cœrulea, Bluets; Iris cristata, Crested Iris; I. verna, Spring Iris; Mertensia Virginica, Smooth Lung-wort; Oxalis violacea, Violet Wood-Sorrel; Phlox divaricata; Viola cucullata, Common Blue Violet; V. delphinifolia, Larkspur-leaved V.; V. palmata, Hand-leaf V.; V. pedata, Bird-foot leaved V.; V. sagittata, Arrow-leaved V.

YELLOW.—Corydalis aurea, Golden Fumitory; Stylophorum diphyllum, Celandine Poppy; Viola Canadensis, common Yellow Violet; V. pubescens, Downy-leaved V.; V. rotundifolia, Round-leaved V.

SUMMER.

WHITE.—Abronia fragrans; Anemone Pennsylvanica; Apocynum androsæmifolium, Spreading Dogbane; Astilbe decandra; Cimicifuga Americana, Bugbane; C. racemosa, Black Snake-root; Clintonia borealis; C. umbellata; Cornus Canadensis, Dwarf Cornel; Cypripedium (Lady's Slipper) candidum; C. spectabile; Euphorbia corollata; Gillenia stipulacea, American Ipecac; G. trifoliata, Bow-man's Root; Habenaria lacera, Ragged fringed Orchis; Mitella diphylla, Two-leaved Mitre-root; Parnassia Caroliniana, Grass of Parnassus; Pentstemon Digitalis; Smilacina racemosa; S. stellata, False Soloman's Seal; Spiræa Aruncus, Goatsbeard; Yucca angustifolia; Y. filamentosa, Adam's Needle.

RED AND PURPLE.—Aquilegia truncata, California Red Columbine; Callirrhoe involucrata; Cypripedium arietinum, Ram's Head Lady's Slipper; Dodecatheon Meadia, Shooting-Star; Epilobium angustifolium, Great Willow-Herb; Habenaria fimbriata, Fringed Orchis; Lilium Philadelphicum, Orange-red Lily; L. superbum, American Turk's Cap Lily; Lythrum Salicaria, Loosestrife; Monarda didyma, Oswego Tea; M. fistulosa, Wild Bergamot; Phlox Carolina; P. glaberrima; P. pilosa; Pentstemon barbatus, var. Torreyii; P. Cobæa; P. grandiflorus; P. pubescens; Rhexia Virginica, Meadow-beauty; Rosa blanda, Early Wild Rose; R. Carolina, Swamp Rose; R. lucida, Dwarf Wild Rose; Silene Virginica, Fire Pink; Spigolia Marilandica, Pink Root; Spiræa lobata, Queen-of-the-Prairie; Verbena Anbletia.

BLUE.—Campanula rotundifolia, Harebell; Delphinium exaltatum, Tall Larkspur; Erigeron speciosum; Gentiana crinita, Fringed Gentian; Iris Virginica, Slender Blue Flag; Iris versicolor, Large Blue Flag; Linum perenne, Perennial Flax; Lupinus polyphyllus, Many-leaved Lupine; Pentstemon glaber; Pentstemon ovatus; Petalostemon violaceus, Prairie clover; Polemonium reptans, Jacob's Ladder; Statice Limonium, Sea-Lavender; Tradescantia pilosa, Western Spiderwort; Tradescantia Virginica, common Spiderwort.

YELLOW AND ORANGE.—Aquilegia chrysantha, Rky. Mt. yellow Columbine; Asclepias tuberosa, Butterfly Weed; Cassia Marilandica, Wild Senna; Coreopsis lanceolata; Cypripedium parviflorum; C. pubescens; Gaillardia aristata; Habenaria ciliaris, Yellow Fringed Orchis; Helenium Hoopesii, Hoopes' Sneezeweed; Hypericum pyramidatum, Great-flowered St. John's Wort; Lilium Canadense, Canada Lily; Lysimachia (Loosestrife) lanceolata; Mimulus moschata, Musk Plant; Œnothera (Evening Primrose) biennis, var Lamarckiana; Œ. fruticosa var. linearis; Œ. Missouriensis; Silphium laciniatum, Compass Plant; Uvularia grandiflora, Bellwort.

AUTUMN.

WHITE.—Aster Tradescantii; Boltonia glastifolia; Eupatorium ageratoides, White Snake-root; E. aromaticum; Heuchera villosa, Hairy Alum-root; Hibiscus Californicus; H. militaris.

RED AND PURPLE.—Aster Novæ-Angliæ, New England Aster; Boltonia latisquama; Chelone Lyoni—the true one; Hibiscus Moscheutos, Swamp Rose-Mallow; Liatris (Blazing Star) punctata; L. pycnostachya; Lobelia cardinalis, Cardinal Flower; Vernonia Arkansana, Arkansas Iron-weed; V. fasciculata, Western Iron-weed; V. Noveboracensis, common Iron-weed.

BLUE.—Aconitum uncinatum, and Monkshood; Aster azureus; A. Curtisii; A. Shortii, etc.; Conoclinium cœruleum, Mist Flower; Gentiana Andrewsii, Closed Gentian; Lobelia syphilitica, Great Blue Lobelia.

YELLOW.—Brachychæta cordata, False Golden Rod; Gaillardia pinnatifida; Helianthus (Sunflower) agustifolius; H. decapetalus; H. orgyalis; H. strumosus; H. trachelifolius; Rudbeckia hirta, Coneflower; R. triloba; Solidago, many species—Golden Rod.

For the benefit of those who live near the sea, I append the following list of plants that will flourish in salt-impregnated soils, and which was kindly compiled for me by B. M. WATSON, Jr. of the Plymouth Nurseries, and Professor of Horticulture at the Bussy Institution, Harvard University.

The following are true water plants:

Lathyrus maritimus; Prunus maritima, white, May, will grow inland; *Epilobium palustre, May, will grow inland; Solidago sempervirens, yellow, pink, July, poor; Solidago sempervirens, yellow, July, very fine; †Statice Limonium.

The following plants will grow on the beach, marsh, and adjoining lands, also on the upland, *i. e.*, away from the sea:

Viola pedata; Hudsonia tomentosa, yellow, May; H. ericoides, yellow, May; † Drosera rotundifolia, in salt marsh; Spergularia salina, white, July; Rhus typhina; R. glabra; Vitis in variety; Celastrus scandens; Prunus serotina, Spiræa tomentosa, June; Rosa lucida; Amelanchier Canadensis; Hyssa multiflora; Liatris scariosa, purple, August, September; †Vaccinium macrocarpon; Clethra alnifolia; Azalea viscosa; Kalmia angustifolia; Ilex verticillata: Calystegia sepium; †Gentiana crinita; Asclepias tuberosa; Corema Conradii, dark chocolate, April; Myrica cerifera; Carya; Cupressus thyoides; Juniperus Virginiana; J. Sabina var. procumbens; †Pogonia ophioglossoides; †Iris versicolor and Lilium Philadelphicum. None of the above plants would be injured by salt in the air nor in the soil in moderate quantity.

WATER AND BOG PLANTS.

The ponds and streams throughout the country furnish us with many beautiful and appropriate plants, that necessarily require to be grown in water,—and surely all pretentious gardens should have water, if not for aquatics, at least as a feature of landscape. We have white and pink Sweet-scented Pond Lilies in the Eastern States, larger White Lilies in the West, Spatter-docks (Nuphar) everywhere, and Water Chinquepins, South and West. All these are suitable for clumps in ornamental waters. A clump of Cat-tail Flag or Burr Reed may be admissible by way of variety, and the Water Knotweed (Polygonum amphibium), on account of its showy red flowers. Blue and Yellow Bladder worts floating about, add interest to beauty. The pretty and showy white flowers of Orontium aquaticum, commend that species to a foremost rank, and the Water Arum amply repays a footing near the margin. Pickerel-Weeds and Arrow-Heads, blue and white flowered respectively,

* These two grow in the wet marshes, the others on dry sand,

† Marsh plants.

bloom freely, and look well enough, but a too free use of these plants impresses a ragged and weedy appearance, hence they should be used in moderation.

It is quite distasteful to see Pond Lilies and other aquatics matted together in dense thickets. To enhance attractiveness, the water should be clean, and all aquatics in suitably large clumps, and under no circumstances interlacing with, or overcrowding one another, otherwise we shall be building with the one hand and pulling down with the other. A good and easy way of planting Pond Lilies and similar plants is to tie the roots firmly to a tough sod and cast it into the water. They don't require much soil to grow in; in fact, those in our ponds here grow too rankly, in a two-inch layer of mold—accumulated sediment on a solid brick-clay bottom.

The bog is the natural habitat of many of our veriest floral gems. The American Turk's Cap Lily, Blue Flags, Meadow Beauty, purple Pitcher plant, "Cowslips" (Caltha palustris,) Cardinal Flower, Sundews, and our host of beautiful Lady's Slippers, Fringed Orchises and other Orchids thrive better in the bog than anywhere else. It does not necessarily follow, however, that because plants are naturally indigenous to swamps, we cannot utilize them in the flower gardens, but, on the contrary, we can employ the most of them when so transposed, with the happiest results. Certainly an arid soil and exposed position will prove fatal to many of them, but surely we have discretion enough to give this class of plants the moistest nook in the garden, and too, a little shade. Cardinal Flowers, Spring Beauty, Mimulus ringus, Irises, Lady's Slippers, Helonias bullata, and many others we grow quite handsomely in moist shady flower-borders, but Sundews, Pitcher Plants, Water Arums, and several others cannot be grown under ordinary garden conditions.

Artificial bogs are sometimes made in gardens and are charming adjuncts. Where they are impracticable the beauty of the neighboring natural ones can be intensified by transposing thither different genera and species from other places, and displacing by plucking over or otherwise, such rank or weedy plants that might presumably choke the prettier subjects. I have seen Sundews, Northern and Southern Pitcher Plants, Pinguiculas, and Venus' Fly Traps grown quite nicely in cold frames, in pots plunged in sphagnum that was kept a living carpet throughout the year.

Besides the plants already mentioned Scutellaria versicolor, Sabbatias, Buckbean, Goldthread, Willow-herbs, Sweet Flag, Water Plaintain, and Myosotis palustris var. laxa are also pretty bog plants.

CLIMBERS AND TWINERS.

These are especially useful in our own gardens for covering arbors, climbing pillars, shading piazzas, draping fences and walls, screening unsightly objects or trailing over rocks or banks; or, as in the case of our Wistaria (W. frutescens), Trumpet-creeper (Tecoma radicans), and Wild Balsam apple (Echinocystis lobata), for their own intrinsic beauty. Such plants abound in the woods and by the waysides, and are particularly plentiful in low rich ground, and in the neighborhood of rivers, creeks, or branches, lakes or ponds, and where they often form almost impregnable networks. Young plants if well cut back and lifted with good roots may be successfully transplanted from their native wilds to our gardens, providing this be seasonably done—say from October to April, and due care be otherwise given them. Or they must be propagated by means of seed, as in the case of the Climbing Fumitory (Adlumia cirrhosa) and Wild Balsam Apple.

Besides our many species of generous Grape-Vines and uncivil Smilax, the following kinds are fast-growing and highly decorative; Ampelopsis quinquefolia, Virginian Creeper; Aristolochia Sipho, Pipe-Vine; Apios tuberosa, Ground-Nut; Bignonia capreolata, Common Bignonia; Calystegia sepium, Hedge Bindweed; Celastrus scandens, Climbing Wax-work; Clematis Virginiana, Common Virgin's Bower; Ipomœa pandurata, Man-of-the-Earth Creeper; Lonicera sempervirens, Trumpet Honeysuckle; Menispermum Canadense, Moonseed; Rosa setigera, Prairie Rose.

FERNS.

Ferns abound by the roadside ditches, in moist shady woods, in springy fields, and in and around swamps. The Wall-Rue is found on exposed limestone cliffs, the Walking Fern on damp mossy rocks, the Common Polypody on rocks and tree stumps, the Maiden Hair and Climbing Fern, in shady woods, and the Chain, Sensitive and Cinnamon Ferns are common in swamps. Mountainous and rocky regions are usually rich in ferns, which delight in crevices and shady ravines, the smaller species being generally indigenous to the higher elevations, and the stronger kinds to the lowermost places. Notwithstanding this divergence of location, we can grow the following kinds to perfection in our gardens, on a little rockery in a moist shady nook, giving them if practicable a peaty in preference to a loamy soil, though peat is not imperative. Neither is a rockery absolutely needful: Adiantum pedatum, Maiden Hair; Asplenium ebeneum; Asplenium Trichomanes; Asplenium Ruta-muraria, Wall-Rue; Asplenium thelypteroides, Asplenium Felix-fœmina, Lady Fern; Aspidium acrostichoides; A. marginale; A. fragrans; A. cristatum and vars; A. spinulosum; A. Goldianum; Camptosorus rhizophyllus, Walking Fern; Cystopteris bulbifera; C. fragalis; Dicksonia punctilobula; Lygodium palmatum, Climbing Fern; Onoclea sensibilis, Sensitive Fern; Osmunda cinnamomea, Cinnamon Fern; O. Claytoniana; O. regalis, Royal Fern; Phegopteris polypodioides, Beech Fern; P. hexagonopteris; P. Dryopteris; Polypodium vulgare, Polydody; Struthiopteris Germanica, Ostrich Fern; Scolopendrium vulgare, Hartstongue; Woodsia Ilvensis; W. obtusa; Woodwardia Virginica, Chain Fern.

Botanic Garden, Harvard University.

TEA PLANT.

NOTES FROM THE RURAL GROUNDS.

AN EXPERIMENT WITH GLADIOLI.

How deep is it advantageous to plant Gladiolus bulbs? The answer can only be given when the character of the soil is known. The following little experiment was made in an ordinary garden soil to which a considerable quantity of sandy muck was added three years since. All were medium-sized, healthy corms of the same variety—an unnamed seedling—and planted May 1st.

No. 1. Planted eight inches deep from top of corm. Up June 1st; bloomed July 26; one blooming stalk four feet high. Taken up after frosts, there was but one new bulb, large, deep and shapely—no bulblets.

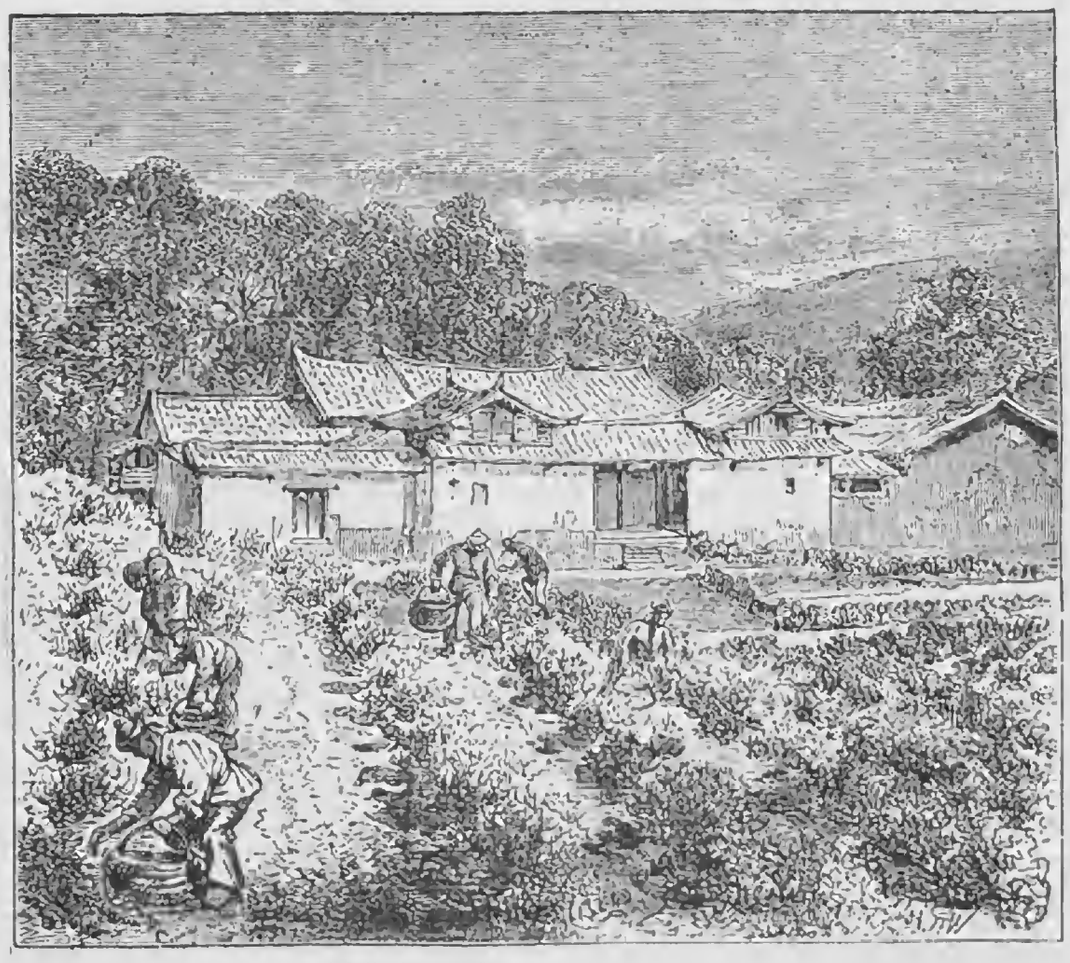
No. 2. Planted six inches deep. Up May 21st; bloomed July 25; same hight as No. 1. Two medium-sized bulbs, ten bulblets.

No. 3. Planted four inches deep. Up May 21st; bloomed July 25; three blooming stalks, three and one-half feet high. Three bulbs, two large, one small; twenty bulblets.

No. 4. Planted two inches deep. Up May 22; bloomed Aug. 1st; two blooming stalks, forty-two inches high. One medium size bulb, four bulblets.

No. 5. Planted four inches deep, upside down. Up June 1st; bloomed Aug. 5; two blooming stalks; large, deep bulb, twelve bulblets. The leaves and flowering stems, instead of growing upright as when the bulbs are planted as they should be, grew at an angle of about forty degrees.

It would appear from this little experiment that in such soil as we describe, the best results are obtained from planting the corms four inches deep, measuring from the top. As regards the



GATHERING THE TEA

BEST TIME FOR PLANTING,

there is some difference of opinion. We have chosen from about the 1st to the middle of April, for the main planting, continuing until the middle of July for succession at intervals of ten days or two weeks. They may be planted six inches to one foot apart and staked as staking becomes necessary. If the plot is sheltered, staking is not necessary except for the taller-growing varieties. A situation in which the blooming stems are sheltered from the sun from ten to three, is to be preferred, and a summer mulch of well-decomposed manure will be found advantageous.

Feb. 20.

Everywhere.

RURAL SPECIAL REPORTS.

SYRACUSE, N. Y. March 26.

WE are now getting genuine, old-fashioned March weather. Several inches of snow have fallen, within the last forty-eight hours, with a stiff northwest wind, and the thermometer at 12 degrees above zero. However, disagreeable March is so nearly gone, that we endure the balance of it philosophically. Farmers are not yet over-burdened with silver. Notwithstanding the "croakings" of the hard money advocates, we shall probably have none too much money in circulation among farmers. All kinds of farm produce are rather low, but officers' salaries and lawyers' fees do not appear to shrink perceptibly. Butter is selling at about 25c. per pound; whole hogs at $4 50@5 per hundred; hay at $10 per ton; potatoes, 40c. per bushel; corn, 45@55c.; wheat, $1.20@1.25. Eggs, 10@12c. per dozen, which is lower than they have sold in many years, and as the old lady said, "It hardly pays for the wear and tear of the hens."

NEW MILFORD, OHIO, SPRING HILL FACTORY

I see by a recent inquiry that one of your correspondents wants to know of a suitable paint for inside work in cheese factories.

Previously we had used the best white-lead and oil for painting our vats and presses, and all inside work in our cheese factory. We found it would not withstand the action of acids, and hot and cold water. Seeking a paint more durable and suitable, we were advised to try the Gutta Percha Paint manufactured by the Gutta Percha Paint Co., of Cleveland, Ohio. We have tested their paint thoroughly, having used both cold and scalding water on it daily for eight months without its sustaining any perceptible injury therefrom. We think it the best paint within our knowledge. Having painted the outside of our dwelling-house and factory, we find it equally applicable for that purpose. These facts are for the benefit of your readers. H. B. CAMP.

SALEM, Ohio.

PURE BONE.—The Excelsior Fertilizer Works, Salem, Ohio, are noted for the superior quality of their bone. A recent visit to the works and inspection of the processes of manufacture, disclosed the cause of their reputation. The best material treated in the most effective manner, is turned out and goes forth into the markets as "Premium, Pure, Odorless, Fine-ground Bone." It is an excellent article and worthy of being most extensively used

JAMESVILLE, Wis., March 22.

WE have had a fine open winter. Wheat is now coming into market. Farmers are getting $1.05 for it. Spring wheat is being planted now and we will have a larger acreage in wheat this year than usual. Barley is our principal crop. We plant it in April. B. C.

Industrial Implements.

THE THOMAS RAKE.

THIS rake has been before the agricultural public four years, and this season appears with improvements that possess practical value. It is a hand-dump, constructed of the best material, in a substantial manner, and has many interesting peculiarities that distinguish it from other rakes. These we have not space to particularize, but they are deserving of the attention of farmers. The circular issued by the manufacturers, J. H. THOMAS & SONS, Springfield, Ohio, will supplement this brief mention admirably. It may be had for the asking. The points in favor of this hand-dump rake are, that the dumping is assisted by the driver's weight, which reduces the power applied by the hand to the lever to a mere nominal start. The teeth are not kept down, while in operation by the aid of the operator nor do they crash on the ground after discharge, irrespective of the will of the driver, thus avoiding jar, damage, and as a natural consequence, repairs. The rake is made to dump at the option of the operator, whether the motion is forwards or backwards, and there is no changing of the feet from lever to chain or the reverse, to distract or confuse the mind.

This rake has large teeth, the axle stands high, and by the application of the cleaner-bar the full circle of teeth is clear for raking. This is an important advantage, permitting a large windrow to be gathered and dumped. Bottom or green hay is turned over well on top, thereby aiding materially the curing process. It is in brief, cheap, simple in action and very durable.

The portable farm engine made by this company is also meeting with marked favor.

THE "COQUILLARD" wagon has a fine reputation, and the manufacturer, A. COQUILLARD, South Bend, Ind., maintains the excellence of his manufacture by personal supervision. Owning a large tract of suitable timber, he has the advantage of selecting only the best material for his own use, and by the adoption and application of improved machinery, it becomes merely a question of time to produce a handsome well proportioned, tastefully finished, light-draft, and strong wagon. The manufacture is not confined to farm wagons. Platform, express, grocers' and other styles of light vehicles are made as well as carriages, buggies and sleighs. Photographs and descriptions of either will be sent on application.

Miscellaneous.

JOTTINGS AT KIRBY HOMESTEAD.

COL. F. D CURTIS.

THESE are busy times on a stock farm. January weather has set in after a month of spring and everything feels the pinch of cold. The little lambs and pigs which are coming every day are sure to be chilled unless carefully tended and kept in a warm place. To-day, just while the sheep were out of the pen getting a drink, a lamb was dropped in the yard. In five minutes it was stiff and showed hardly any signs of life. It was wrapped up at once in a horse blanket and brought into the kitchen and put into a pail which was filled with hot water, not hot enough to scald, but hot enough to revive this lamb in less than ten minutes. It was then put down behind the stove and covered up, and within an hour afterwards it was taken out to the barn and given to its mother. We would not have taken it out so soon if it had kept quiet but it bleated so hard, and ran around so smart there was danger of its getting its nose burnt on the stove. A little pig got chilled the other day but it died in spite of care. When the weather is too cold it is best to remove young pigs to the house or by a fire as soon as they are born, and about an hour afterwards take them to the mother and if there is danger of chilling take them back. Generally after a young thing has got dry and has sucked it will stand the cold if it is protected from the winds and is in-doors. We have a Jersey cow now which was born in winter. We had a faithful man and he was close at hand to look after the coming pet. He forgot one thing; to dry the end of the tail, so that froze and the shortened brush is a constant reminder, and so no accident of that kind has ever happened since.

Last week we said: "Next Monday we must put in the early peas, the earlier the better." The theory is good yet, but the practice of it must be postponed we don't know how long, for the ground is frozen like a rock. Had we got the peas in the ground they would not have hurt, but they will doubtless be just as early if planted next week. The young plants will stand a severe frost and will grow when the temperature is a little above the freezing point, hence a week or two's the start is important. We always intend to have green peas by the first of July. The Daniel O'Rourke is a good kind, a favorite with us but not quite so early as Carter's (?). The latter were ready for use in our garden last year, the latter part of June. Neither of these are dwarf varieties. We do not like them as they fall on the ground and spoil. They are as much trouble to grow as the best sorts and do not yield nearly as well.

A love for tea is an acquired taste the same as a relish for tomatoes. Why may not Americans educate themselves to like a cup of tea which shall be grown in this country. It might not be so pleasant at first, but after awhile we might get to liking it better than the heathen sort. It won't hurt us to try, and since the Commissioner of Agriculture is willing to supply the plants to those who are willing to try, and we must have tea, why let us try. We have got two tea plants started just for the notion of the thing, and if our climate would admit, we would have a score of them, they will not live above a freezing latitude except under cover. It is best for any people to be as independent as possible of all others both in matters of necessity as well as in things of taste and luxury. A few years ago it was thought we could not make wine in this country, and now American wine goes abroad. We cannot compete with China and prepare tea as the Chinese do, but may be there is some other way which will cost less. Experience will teach us.

Last fall we got a load of buckwheat screenings from the grist mill and put them in the hen-house for the fowls to scratch in and pick over. The dust from the buckwheat poisoned the heads and necks of the turkeys, which caused them to scratch themselves until the red skin became so raw and inflamed, that some of them were nearly blind. Their legs were tied loosely so they could not scratch and they were removed to another place. They are now nearly well. Mr. DAVID SMITH says his turkeys once got sore in a similar way by running in a buckwheat field. The grain will not poison anything as we have fed it to all sorts of animals sheep included without harm.

The low price of produce is causing many farmers in this section to think they must raise their own breadstuffs. Winter wheat has been for many years a risky crop. The old enemies Weevil and Hessian Fly used up the wheat thirty years ago, and most farmers abandoned its cultivation altogether. For the last fifteen years a few enterprising men have grown their own breadstuffs, sometimes getting a good yield which by being kept in the granary would help to bridge over a poor year. Two years ago wheat growers about here scarcely got their seed back again; it winter-killed so badly. Last season the return was beautiful. Winter wheat requires a liberal manuring in the surface with fine well-rotted manure. A few acres make a large draft in the barnyard. Spring wheat is not of so good quality, and the flour under the old processes is inferior and the good wives don't like it. The Minnesota patent process makes the best of flour out of spring wheat. Now if we should all go to raising spring wheat our millers could afford to put this patent machinery in their mills and we could have first-rate flour, the product of our own farms. The old kinds of spring wheat were dark and thick-skinned, closely resembling rye and the flour was sticky and black. Two new sorts of spring wheat are offered which we think are very promising and valuable and much better than the old kinds. They are hybrids produced by Mr. PRINGLE of Vermont. One, the Champlain, is bearded and is an early variety; the other, the Defiance, is beardless and is very productive, with large white kernels. Spring wheat may be sown as late as June. We have helped harvest it in October; a good crop.

LICE EXTERMINATOR.

YEARS ago I discovered that ALOES in fine powder is a specific for the destruction of lice on all animals, and as it has no poisonous properties, its intense bitterness being what kills, it can be freely applied, and as it is to be used in a dry state, its application is as safe in cold as in warm weather, consequently is free from all objections urged against other remedies. My regard for the comfort of animals and the interests of their owners induce me to publish this for the benefit of all concerned, and as this is the season when these parasites are usually most numerous and annoying, an opportunity is afforded for testing its unparalleled merits.

Directions: Fill a large common pepper box with the powder and sprinkle freely into the hair, on the neck, back, sides, and rump of the animals infested, and rub it thoroughly through the hair and on the skin with the ends of the fingers; leave it undisturbed for a week. Then card or curry thoroughly and apply as before, and so continue at intervals of a week, until there is not a living parasite. I have used and recommended this exterminator in numerous cases without a failure, and two different applications, if thoroughly made, generally suffice.

Oneida, Co., N. Y. W. J. P. KINGSLEY, M. D.

CATTLE SALE.

IT just occurs to me that perhaps RURAL readers would be interested in learning the result of the sale of imported Alderney cattle in this city on the 19th inst. Here it is. It will be seen that prices are still maintained notwithstanding the depression in the times, and are prohibitory to persons of limited means.

23 head, all but three, two years old, brought in the aggregate	$8,365.
Average	380.
Two of the cows had calves less than a week old. The B calf brought	75.
The C. calf	120.
	$8,560.
The two Guernseys brought $300 and $170 respectively	470
Making a grand total of	$9,030

Conundrum: How long will it take them to yield enough gilt-edged butter, at fifty cents a pound, to pay for their cost? W.

CATALOGUES, &c., RECEIVED.

WOOLSON & Co., Passaic, N. J. Descriptive Catalogue of Hardy Perennial Plants and Price-list. One of the best and most accurate lists of this class of plants published.

WE thank Messrs. THORBURN & Co. of this city for a case of novelties among vegetable and flower seeds and potatoes to be tested in the RURAL Experimental Grounds.

H. W. HALES, Ridgewood Floral Nursery. Descriptive Catalogue and Price-list of choice plants, Ridgewood, N. J. An excellent list of Geraniums, etc. The bright, plain, little catalogue of 16 pages is free to applicants.

WILLIAM PARRY, Cinnaminson, N. J. Fruits, Grapevines, Small Fruits. The Lady and Brighton Grapes, and the Great American Strawberry specialties.

WOODRUFF'S Eighth Annual Catalogue, and list of choice selected flower, bedding and vegetable plants for 1878. Verbena Cottage, Westfield, Union County, N. J.

EIGHTEENTH ANNUAL REPORT of the Transactions of the Hoosac Agricultural Society for 1877, North Adams, Mass. Thanks to the Secretary, Mr. H. CLAY BLISS.

SEVENTH ANNUAL REPORT of the Secretary of the State Pomological Society of Michigan. This is one of the most accurate, interesting, and instructive works of the kind we have ever examined. CHARLES W. GARFIELD is the accomplished Secretary. It is one of the few reports that one desires to put in his library, and to keep there as a book of reference.

A TREATISE ON POTATO CULTURE, by Mr. WILLIAM HUNT, Waterford, Conn.

THE AMERICAN SALT Co., Syracuse, N. Y. Circulars to the consumers of, and dealers in, Factory Filled Dairy Salt in the U. S.

ELLWANGER & BARRY, Mount Hope Nurseries, Rochester, N. Y. No. 1, with colored plate, 15 cents, plain 10 cents. No. 2, with colored plate, 25 cents, plain 15 cents; Nos. 3, 4, and 5, free.

No. 1—A Descriptive Catalogue of Fruits.

No. 2—A Descriptive and Illustrated Catalogue of ornamental Trees, Shrubs, &c.

No. 3—A Catalogue of Dahlias, Verbenas, Petunias and Select New Green-House and Bedding Plants, published every spring.

No. 4—A wholesale Catalogue or Trade List.

No. 5—A Descriptive Catalogue of Roses; plain, free; with colored plate, 10 cents.

This is one of the oldest, most extensive and and most trustworthy establishments in this country.

EDWARD A. FROST, Genesee Valley Nurseries.

No. 1—Descriptive catalogue of Fruit Trees, vines, &c., 10 cents.

No. 2—Descriptive Catalogue of Ornamental Trees, Shrubs, Roses, &c., 10 cents.

No. 3—Descriptive Catalogue of Green-house, Plants, Bulbs, Dahlias, &c. 5 cents.

No. 4—Wholesale Catalogue, or Trade List, for Nurserymen, &c. Gratis.

This establishment also ranks as among the first in this country.

[We have never before been asked the question so many times "What concern shall I order from?" as during the present season; probably be cause the RURAL has never before given to Horticultural matters the liberal and careful attention that of late it has been enabled to give through the advantages of extensive experimental grounds which are devoted to testing every thing which can be advantageously tested in this climate. Now we desire to state that the firms (or their representative catalogues), noticed in this column are those which, either from having dealt with them ourselves, or from established reputation, we *know* to be in every way honorable and worthy of confidence. Generally their advertisements will be found in other columns.—EDS.]

ANSWERS TO CORRESPONDENTS.

Miscellaneous.

Mrs. S. T. L., Spring Grove, Fla., inquires where she can get Chufas for seed.

ANS.—They are advertised in our columns.

T. W. C., Kalamazoo, Mich.—wishes to know where he can get a good work on raising small fruit, and its price.

ANS.—A work by the Rev. E. P. Rowe published by the Orange Judd Co. of this city is as good as any we know of; price 50 cents.

Webster, Monroe Co., N. Y., inquires whether he should plow his orchard which is pastured by sheep, sow winter rye early, let it get a good start and then turn in the sheep.

ANS.—We should say that it would pay just in proportion as his land is rich and can afford so liberal a supply of plant food.

W. Chapman, Capac, St. Clair Co., Michigan, wishes to learn the nature and price of lands in Stafford and adjoining counties, Virginia; is the land thereabouts good for farming and raising sheep and cattle, and what is the nature of the soil.

ANS.—Of our own knowledge we can give no information. Some of our friends living in that district may answer. Write to Wright, Saunders & Co., Suffolk, Va.; W. A. Parsons & Co., Goochland Courthouse, Va.

M. W., Cleveland, Ohio, and others.—Where can I get the Euonymus and Golden Retinospora you speak of in RURAL of March 2?

ANS.—Ellwanger & Barry, Rochester, N. Y.; S. B. Parsons, Flushing, N. Y.; Thomas Meehan, Germantown, Pa.; Edward A. Frost, Rochester, N. Y.; Smith & Powell, Syracuse, N. Y.

Trimming Rose Bushes

D. G. B., Franklin Park, Middlesex, N. J., inquires how to trim Monthly Rose bushes so as to cause them to flower.

ANS.—Cut out all weakly shoots and the rest back to two eyes. If bushiness is desired cut back the shoots from these to two eyes. Give a light soil and add plenty of old manure.

A Good Chance for Old Friends.

Geo. C., North Linndale, Ohio. — has been waiting for an opening through which old subscribers to the RURAL may have an opportunity of getting a "Cricket" clock.

ANS.—We would state that the offer of $3.50 for the clock and one subscriber is an offer to old subscribers. In all of our offers we have endeavored to consider them first. The seed distribution has been to old subscribers alone.

Liquid Manure Pipe.

F. T. Martin, Preble Co., O. wishes to know the best kind of pipe for liquid manure.

ANS.—Two-inch glazed tile would be a good deal cheaper than lead or iron and less likely to become obstructed by sediment. Place a strainer at the upper end to lessen the liability to trouble from sedimentary deposits, and the more rapid the inclination of the pipe the less annoyance from this cause.

The Poultry Yard.

HATCHING CHICKENS.

HENRY HALES.

THIS is the special business of the spring with poultry-keepers, and requires all the thought and care that can be given to the subject aside from other duties of the farm. In the first place, eggs selected for hatching should be placed in trays. Of these a soap box cut through the center will make two. The eggs should not be laid on each other, but placed singly in rows on cut hay or some soft material, and if more than one breed are kept, the variety that laid the egg as well as the day on which it was laid, should be marked on each with a pencil. They should be turned over every day, each end being placed alternately uppermost: that is, one day the large end up and the next day the small one. By this care the eggs will hatch much better than if left on one side, as the yolk floats to the top whichever way the egg is left, and dries to the side, spoiling it for incubation.

A cool cellar is the best place to keep eggs in. When both eggs and hens are ready, the eggs should be marked with ink, for pencil marks become obliterated during incubation. A good way is with a little brush or stick to make a ring round the eggs near either end, but so far on that a glance into the nest will detect any eggs laid therein, during incubation. It is well not to made this ink line around the center of the eggs, as it might interfere with the hatching, if the ink covers that part of the shell where it opens to let out its tenant.

Eleven or twelve eggs are enough for a hen in cold weather, but in warm weather thirteen may be set. Never set a hen in a deep nest, as she will break the eggs when jumping into the nest. The best way to prepare a nest, is to cut a grass sod the size of the bottom of the nest-box: make it a little hollow, so that the eggs may not roll to the side; make the nest on this sod with a little straw near to the top of the nest, box or basket. Whenever you can set a hen where she has laid, do so, unless it is in a place where other hens would trouble her. It is best to give a hen the eggs at night, particularly if you remove her to a new nest. When convenient, set several hens at the same time. Should many eggs prove bad when examined after the first eight days, the good ones may be distributed to some of the hens to make up a full number to each hen, and the remaining hens can have fresh eggs given them. The way to tell whether eggs are good is to hold one at a time up to the sun or lamp light, shading the egg with your hands all round excepting the side towards the lamp and the opposite side turned to the eye, so that the egg can be seen through. Should it appear quite clear it is not fertile. At that stage of incubation, eggs that are not sterile will appear dark almost all over.

To keep hens clear from parasites while sitting it is good to dust a little pulverized sulphur through their feathers and in the nest: all sitting hens should be so treated. Difference of

opinion exists as to letting a hen sit without disturbing her. I prefer looking into the nest daily. In case an egg gets broken, it should be taken out, the eggs that get soiled washed, and the bottom of the nest cleansed. If this is not done the nest becomes foul and unhealthy, not only for the hen but for the chicks. The wildest hens soon become accustomed to being handled on the nest, when this is done carefully.

In cool weather eggs may generally be left without further trouble, but in hot weather sometimes the chicks have difficulty in breaking the shell and often perish in the attempt. To prevent this a little tepid water sprinkled in the nest, from the seventeenth to the nineteenth day, will help the shell to part. During the process of incubation, the shell of an egg becomes brittle, and just at the time of hatching breaks very easily. A little moisture increases the brittleness of the shell, especially if applied a few days before hatching. A hen set on the ground, however, does not require to have her nest moistened. Ducks' eggs hatch much better on the ground than in a high nest. If the hen has been accustomed to being handled, it is best to look to the nest while hatching and take out some of the empty egg shells, as they often impede the chicks that hatch a few hours later than the others, in getting out of the shell. Unless there is too long an interval between the first and last eggs hatching, do not take out the young chicks from the nest: they will do better with the natural heat of the mother, and require no food for twelve to twenty-four hours; for when they leave the shell their stomachs are filled with the yolk of the egg. Sometimes a chick will stick to the shell or rather the inside lining of it will stick to him, in which case the shell can be removed with care, but this must be done very cautiously. If any blood is observed, let it remain longer till it dries.

Horticultural,

OUR NATIVE NUTS.

No. 2.

C. W. IDELL.

THE Chestnut tree for graceful proportions compares favorably with any of our forest trees, particularly when grown single. In the spring it becomes atttractive in appearance with its foliage tinted with a peculiar shade of green, changing its appearance in due time by producing bright blossoms. Then these disappear and the burrs or involucres which contain the nuts make their appearance. When these mature, they open, displaying the fruit clustered in all their beauty. Soon the frost comes hardening it, and changing its clothing of brilliant green to a bright yellow, then brown until it falls leaving the limbs bare.

The timber is valuable. To the farmer it is a favorite to inclose his fields and protect his crops. It is the foundation of our rail roads and with it they are tied together. The carpenters use it largely for trimming our finest houses, and the cabinet makers would not know how to do without it, for it is the wood of which our so-called oak chamber and dining-room sets are made.

The nut is the most valuable one of those named, selling from three to four dollars per bushel when walnuts sell at 50 cents, and hickory nuts at one dollar, and I consider this fruit capable of a greater degree of improvement in size and quality than the others, and I am pleased to be able to state that some of our citizens have begun to cultivate them. During the past season a lot was received in the New York market, and owing to their large size, symmetry of proportions and beauty they sold for nine dollars per bushel when the best of the uncultivated sorts were selling at five dollars.

I hope our farmers will investigate this subject more thoroughly, and plant them, so that in the future, if we ourselves may not live to realize any benefit from the experiment, our children may. We have thousands of acres of cheap lands in this country that might be made productive and very valuable in time by planting these trees. Indeed I do not doubt but that some of us may live to see the day when a grove of Hickory or Chestnut will produce a crop of greater value than many of our orchards now do, to say nothing of the difference in the value of the timber. I would suggest to those who do try it to procure the largest native seed they can, regardless of the cost, for they will take no longer to grow—cost no more to produce and the fruit will be worth fifty per cent more in the market than common fruit.

The nuts grown in Virginia are larger in size than those grown in the north, although in the latter section a few trees that grow singly produce a large, fine nut. It is stated for a fact that the drying of the nut injures the germ, so it will not propagate. That however, is a point still open for experiments and can be tested by any one. [There is no doubt about it.—EDS.]

Our southern shippers are guilty of one serious mistake which those of the north are free from, for as the fruit ripens early, they gather and ship it in close barrels or bags while green, consequently they become so heated while in transit that the germs of the insects they contain are quickened into life—matured, and eat their way out, so that by the time the fruit arrives at its destination, one-fourth of it is spoiled by them, and the shells of the remainder are so blackened that they are unsalable at the market value of good nuts.

Every dealer should understand this point, and be careful not to ship them while green, unless his packages are well ventilated. Even then it would be prudent to spread them out thinly on a floor to cool for a few days before sending them off. Those grown in the north seldom become damaged during transportation, for as the frost ripens it cools them; consequently the shells retain their brightness, and the kernels are free from worms or mold. A bushel of green Chestnuts weighs 60 pounds, and dried ones, 52 pounds, and they are sold in the New York markets at these rates.

Years since the retail nut trade of New York city was confined mostly to the grocery trade. The supply came from the north in good order, and they were sold as received; but of late years a large number of Italians have immigrated to this country and taken up this branch of business so gradually and thoroughly that now they almost monopolise it, and owing to their introducing miniature ovens on their stands for roasting them, they sell large quantities. These men are very particular as to the quality of the nuts they buy. They want them large, bright and perfectly free from worms or mold, and as fresh from the trees as they can get them. They are willing to pay a high price for those that suit them. There is this objection to a dry nut: they will not roast, simply burn, so that one can see why they all want a fresh, plump nut, for as the heat penetrates the nut it engenders steam which in order to escape bursts the shell, leaving the kernel bright and soft, but as the season advances they all become dry. Then they overcome this objection, in a measure, by soaking them until they absorb moisture sufficient to roast, but even then they must be consumed while warm, for if permitted to get cold they become unfit for eating.

The dealers who supply these parties often take great pains to improve the quality and appearance of the nuts. One plan is to place a small quantity of them in a coarse wire sieve and shake them until the furze is removed from the neck of the nut, while at the same time the friction increases the brightness of the shells.

During this process all wormy or defective ones are picked out, which are often saved for fuel, as they make a quick and strong heat. I once tried the experiment of soaking some chestnuts for one hour in warm water, and found it increased their weight three ounces to the pound, or nearly ten pounds to the bushel, besides improving the appearance of their shells and softening the kernels.

In concluding this article it may prove interesting to some to learn that in New York city we receive these nuts from nine different States.—viz.: from Georgia, South Carolina, Tennesse, Virginia, Maryland, Pennsylvania, New Jersey, New York and Connecticut.

USE THE BUFFALO
HONEST FERTILIZER
Ammoniated Bone Super Phosphate,
AND
Pure Ground Bone.

The purity of these goods is guaranteed, and their standard proved by regular analyses of Prof. G. A. Liebig, and other eminent chemists.

No Rock Phosphate. Mineral Guano, Land Plaster, Salt Cake, Spent or Stud e Acid, and other inferior materials, enter into the manufacture of my Phosphate, which is solely made of **Bone, Meat, Blood, Pure Acid and Potash Salts.**

My Works are always open for inspection to every consumer of Fertilizers.

Highest Premium and Medal of Honor awarded to my Fertilizers by the Centennial Commission, Philadelphia, 1876.

Send for new Spring Circular, containing full directions and testimonials. **L. L. CROCKER,**
253 Washington Street, Buffalo, N. Y.

CHEAPEST FERTILIZER
BECAUSE THE BEST.
PREMIUM BONE
For all crops. Made only by the EXCELSIOR FERTILIZER WORKS, Salem, O. Circulars free.

BONE DUST.
FINE GROUND, WARRANTED PURE.
Manufactured by S. H. MORGAN, Toledo, Ohio.

CHOICE FOWLS.—WHITE LEGHORNS' $3 per pair; $5 per trio. Plymouth Rock and White Leghorn Eggs, $1.50 per setting; 2 settings, $2.50. Address LEWIS JENISON, Binghamton, N.Y.

Implements and Machinery.

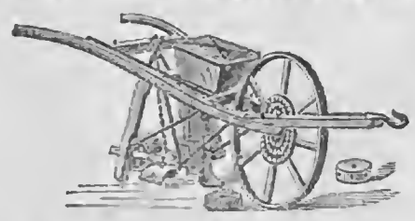
Matthews' Garden Seed Drill,
Matthews' Hand Cultivator,
Matthews' Drill & Cultivator combined, surpass all others. Send for Circular before you buy.
Manufactured only by
EVERETT & SMALL,
Boston, Mass.

CHOICE BUTTER.
Over 1,000 Dairies and Creameries have introduced the Cooley System. Read what people say about it who have used it:
(From Massachusetts Agricultural College Farm.)
AMHERST, Mass., Feb. 9, 1878.
VERMONT FARM MACHINE CO.:—We are so well pleased with the Cooley Creamer that I feel bound to say a word in its favor. It takes us only twenty minutes to churn, and the extra yield of butter is wonderful. I have cheerfully recommended it to to the Japanese Government above all other systems. A. A. SOUTHWICK, Farm Supt.
OGDEN FARM, NEWPORT, R. I., Feb. 7, 1878.
GENTS:—I have thoroughly tested the cans and cheese (Cooley's) that we had of you last fall, and am now using that system in preference to that employed by Col. Waring in former years. I feel that I can fully recommend it. MELVILLE BULL.
Send 3c. stamp for Circular to
VT. FARM MACHINE CO., Bellows Falls, Vt.

PEARCE'S IMPROVED CAHOON
BROADCAST SEED SOWER.
Sows all kinds of Grain and Grass Seed.
No more sowing too much to the left. Small gate for grass seed. Sows 4 to 8 acres per hour. Does better work than can be done by any other means whatever. Only $5. Sold everywhere. Send Stamp for Circular.
GOODELL COMPANY,
Antrim, N. H. Sole Manufacturers.

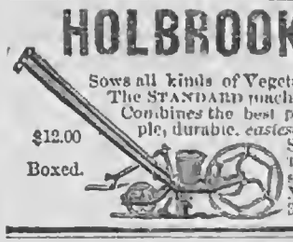
BRICK
AND
TILE MACHINE.
20 YEARS standing as a TILE MACHINE, and without a rival as a BRICK MACHINE.
For Circulars address
J. W. PENFIELD, Willoughby, Ohio.

THE ALBANY CORN PLANTER



The only low-priced Planter with which the Farmer can sow his Corn perfectly both ways. Will plant Corn, Beans, Turnip and small seeds with precision. It will
SAVE ITS COST THE FIRST SEASON.
This PLANTER, at ONE PROCESS, OPENS its furrow, GAUGES, DROPS, COVERS the Seeds and ROLLS them down. ALSO MEASURES and MARKS OFF the DISTANCE for the next ROW or DRILL to be planted.
It is changeable from a *Planter* to a
HORSE HOE
in two minutes' time, and is altogether the most complete Implement for the purposes designed in use. Price greatly reduced for 1878.
Send for Circular, &c., to O. H. P. CORNELL,
Proprietor Albany Ag'l Works, Albany, N. Y

HOLBROOK'S "New Regulator" SEED L



Sows all kinds of Vegetable Seeds with regularity. The STANDARD machine. REMODELED for 1878. Combines the best points ever produced. Simple, durable, *easiest handled*, OPEN WHITE SEED CONDUCTOR SHOWS THE SEED DROPPING. Give satisfaction. Circulars Free. Made by E. E. LEMMUS & Co. 32 S. Market St. Boston, Mass.
$12.00 Boxed.

New Publications.

TO ADVERTISERS! We will send free to all applicants who do any newspaper advertising, the THIRD EDITION of
AYER & SON'S MANUAL
FOR ADVERTISERS. 160 8vo. pp. More complete than any which have preceded it. Gives the names, circulation, and advertising rates of several thousand newspapers in the United States and Canada, and contains more information of value to an advertiser than can be found in any other publication. All lists have been carefully revised, and where practicable prices have been reduced. The special offers are numerous and unusually advantageous. Be sure to send for it before spending any money in newspaper advertising. Address N. W. AYER & SON, ADVERTISING AGENTS, Times Building, Philadelphia.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, APRIL, , 1878.

THE original article announced two weeks ago from the pen of Mr. J. B. LAWES, of Rothamsted, England, who has thrown more light upon practical agriculture than any other man, living or dead, is presented in this number.

THE EUROPEAN WAR-CLOUD.

"A SOFT answer turneth away wrath" though an adage coming from high authority, is not always true, and is notably untrue in the dispute that is rapidly coming to a belligerent issue between Great Britain and Russia. How admirable the blandness with which Prince GORTSCHAKOFF agreed, some weeks ago, to the assembling of a Congress to discuss the settlement of the Eastern Question! How plausible his reasons for deferring its meeting until his countrymen had settled the matter in accordance with their own wishes! How benignant his concession that this adjustment should not stand in the way of the proposed Congress! How suave his permission that the plenipotentiaries to it might discuss unimportant points and approve the treaty! And how courteous his firm declaration that in case any difference of opinion arose, Russia was resolved to have her own way, and that on this condition only would she accept the Congress! Yet in spite of all this refined urbanity Great Britain is a-blaze with anti-Russian wrath from Land's-End to John O'Groats and there now remains but little doubt that the baleful conflagration must be quenched in blood. Austria also seems deaf to Muscovite blandishments, and the hereditary enmity between the Maygar and the Slave is likely ere long once more to assert itself in arms. It is by no means improbable that our next issue will record either the actual commencement of another European conflict to which that just closed was merely a prelude, or the adoption by one disputant or the other of some measure that will render such a bloody arbitrament inevitable.

Financially such a catastrophe would be beneficial to this country. By sealing the graneries of Southern Russia and the Danubian Provinces it would afford a profitable market for our heavy grain crops; the arms whose sale would enrich our manufacturers would be doing execution on both sides. A few Russian Alabamas would once more drive under the Stars and Stripes a great part of the commerce lost during the late "onpleasantness"; while the numerous recruiting stations along the Canadian frontier would soon drain from this country much of the surplus labor that adds to our burdens and thousands of the stalwart tramps that add to our miseries.

We refer to these contingent advantages, not as matters for selfish congratulation, but as a sort of consolation for the sorrow all good men must feel at the prospect of widespread death and desolation among kindred and friendly nations.

TILLAGE.

"WHAT is the first essential in good agriculture?" "Good plowing." "What is the second?" "Plowing." "And the third?". "Manuring." Such were the questions propounded and answered two thousand years ago by CATO, among whose many claims to the esteem of his fellow citizens not the least was his proficiency in farming. The advice was good then with regard to the rich lands about Rome, and practical experience during the intervening centuries as well as scientific research during the last, both go to prove the paramount nature of the advantages derivable from the thorough tillage of the soil implied by the ancient philosophers reiterated counsel.

All soils contain immemorially more or less manurial ingredients whose quantity and quality are dependent on their geological formation—on the varying proportions of disintegrated rocks of which they are mainly composed. Moreover, in many of them, there is an admixture of animal and vegetable remains still rich in fertilizing properties. In both cases, however, these properties are imprisoned in an insoluble form and the action of water and air, greatly facilitated and promoted by liberal tillage, is one of the most efficacious means of setting these manurial treasures at liberty and so fitting them for plant-food. The abundant character of this natural supply of nutriment has of late been strongly exemplified by means of an accurate experiment made by Mr. LAWES at Rothamsted, England. For thirty-four successive years he has grown a crop of wheat on the same piece of land, without the application of any artificial manure, and although the crops have had to gather all their inorganic elements, year after year, from the store of plant-food which nature had accumulated in the soil, yet in the yield there has been no decrease which could be clearly attributed to any exhaustion of the supply. Thorough tillage, however, had extirpated all weeds—those greedy gluttons of stolen food—and thrown the way open to the liberating chemical action of moisture as well as of the carbonic acid, oxygen and nitrogen of the atmosphere upon the imprisoned fertility of the soil.

By good tillage, subsequent rains more readily pass through the loosened tilth and penetrate the underlying soil where they remain in reserve against the time of drought. The air penetrates the ground as far as the stagnant water has been drawn off, and the finer the pulverization of the soil, the freer the atmospheric circulation, and the greater the amount of surface exposed to its beneficial chemical action. Moreover, when the earth is cooler than the air above it, the latter is chilled on entering the ground, and in this state, being unable to hold in suspension so much moisture, parts with some of it to the soil, which also absorbs its ammonia as well as some of its carbonic acid and other gasses. Besides the liberating effect these have on the fertilizers locked up in the soil, they are, some of them, notably ammonia, immediately available as plant-food, while without the presence of air no seed-bed can be in a healthy condition. To roots of all kinds air is essential, for if deprived of oxygen for a short time, they die. In heavy soils winter wheat often looks yellow in spring, because its roots have perished on account of the access of oxygen having been prevented by the excess of water in the soil.

The nature of the tillage to be bestowed on different kinds of soil should vary in accordance with their texture. Recent experiments made by Professor S. W. JOHNSON, at the Connecticut Agricultural Station, show that while on clayey lands deep tillage is generally best—to conserve the water of a loose-textured soil, its main tillage should be shallow, so that the bulk of the earth remains compact enough to hold the rain and to transmit bottom-water steadily, by capillary attraction, from the subsoil upwards to the roots of the crops. In such soils the surface only should be loosened whenever it forms a crust. For the same reason, summer tillage also, according to his deductions, should not extend to the roots except in clayey soils to compel them to develop lower down and nearer the water supply, for in unstirred clay soil they can only penetrate a little way and suffer or perish when drought comes. As with fertilizers, so with tillage, the safest guide is experiment. This alone will tell with certainty the depth and frequency of cultivation that will most benefit each sort of crop on all kinds of soil. Careful observation is the foundation alike of scientific theory and intelligent practice, and that farmer will secure the largest measure of success who most accurately notices and records for future reference the relations that exist between his land and its produce under various kinds of treatment.

CONVICT LABOR.

"IF a man will not work, neither shall he eat," has been considered a wise and just saying from time immemorial. That every man should perform some labor, and as producer, exchanger, transporter, or teacher, give an amount of service commensurate in value with the food he eats and the clothes he wears, seems to be a self-evident proposition, and he who does not this, is, as a rule, looked upon with contempt by all right-thinking people. There are thieves who steal, tramps who beg, and confidence men who can be looked upon in no other light than thieves who steal with permission. There are heirs who inherit fortunes and spend them, leading lives worse than those of mere idleness—and gamblers who take advantage of the weakness and folly of mankind—to enrich themselves at their expense; all who take without giving in return forming one great class of which society might well be rid. No man should live at the expense of his neighbor unless in some way he can benefit that neighbor sufficiently to discharge the debt.

It was something in this way we reflected a while since, on our way home from a visit to Blackwell's Island where we saw more than a thousand able-bodied men prisoners, clothed, fed and guarded at a large expense who are not permitted to do profitable work; that is, any work from which the county derives a revenue. They are made of service in making walls, keeping roads in repair, and have aided in the erection of some buildings. They also make most of the shoes used on the island, and have recently built some wagons used by the Commissioners of Charities and Corrections, but nothing that they might, could, would, and should make is allowed to be be sold.

Naturally one looks for the reason of a rule so apparently unreasonable, and on inquiring is told that certain classes of our population object to the manufacture of anything by convicts that will be put in competition with honest labor, and argue that whereas the convicts must be supported at any rate, the articles manufactured cost the county nothing but the material used, consequently the county can put them in market at a price ruinous to manufacturers who pay for their labor. The same general argument is used when it is proposed to hire out the convicts to manufacturers. The wages paid are small because the services rendered are not those of skilled workmen—but small or large, it makes no difference with the objectors—who are of the class that can see nothing which does not seem to promote their own interests; who would destroy all machinery, because it comes in competition as they think with their labor.

An effort is now being made in the State of New York to pass a law for the prisons of the State similar to the one now in force on Blackwell's Island. It will be readily supposed we do not favor such a law. The expenses our criminal population entail upon us in various ways are enormous without adding the cost of food and clothing which every able-bodied man should be allowed and obliged to provide for himself.

ABOUT STRAWBERRIES.

AT this season of the year horticultural papers are every day asked questions as to what varieties of strawberries to plant. Many of them venture specific answers. But when it is considered that the same variety varies from first-rate to next to worthless in different soils and conditions, it will appear that there is but one answer, viz: plant those varieties which from trial are found to succeed best. Each must experiment for himself. Such experiments may be made with so little trouble or expense that it is the fault of the cultivator and not of the strawberry if everybody does not raise upon his own grounds those sorts that will thrive best. Now for one dollar plants of all the best varieties may be purchased. Planted in good soil this spring and labeled, their value and adaptability to a particular place may be ascertained next spring. After that, there need no longer be any doubt or disappointment. Selecting those which prove in size, flavor, vigor, productiveness, the most desirable, every family, with no more trouble than is required to keep down weeds, and form new beds as the old ones wear out, may be supplied with this enjoyable fruit, as far superior to the great bulk of market strawberries as a banana or orange plucked ripe from the plant is superior to those that, plucked green, are left to ripen and decay simultaneously, several weeks afterwards.

The qualities of new varieties of strawberries are now-a-days so puffed up, that those who purchase new plants entertain a vague expectation that the berries will prove sweeter, larger—the vines more fruitful and hardy than any others heretofore known. But experience with the strawberry, as with every other fruit, will demonstrate that man's power of really improving it is very limited, and that he never will be able to combine the best qualities of all in any one variety.

Most of us are very ready to be captivated by size, though size and the characteristic qualities which make a fruit valuable are generally inimical.. We sometimes see strawberries nine and ten inches in circumference. They are curious and pretty. They are nice to pick. They are charming table ornaments. One of them is as large as a dozen wild strawberries. But, just for eating, which had you rather have?

Farmers to the Front.—No Connecticut legislature in late years has had so large a proportion of farmers and so very small a proportion of lawyers as the present; yet it seems the nearly unanimous opinion throughout the State that it has accomplished more work of a practical, needed kind than any of its predecessors in recent days. There has been less "chin-chin," less useless verbiage, less discussion of fine points of no practical importance, and less prophecies about possible contingencies, than usual, but more of the work for which legislators are elected and paid. This is a thoroughly utilitarian country and what the vast bulk of its inhabitants want is plain, practical common sense, in word and deed, not fine-spun theories or elegant verbosity.

BREVITIES.

THERE is no part of the year when cellars in which vegetables are stored, need ventilation oftener than the present. If the cellars cannot be thoroughly aired every day, the vegetables should be removed.

THE American Dairy Fair Committee of the American Dairy Association have selected New York City as the place for holding the fair, next autumn. The time will soon be definitely fixed by the sub-committee appointed to perfect arrangements.

MR. J. B. LAWES in the able article he has written for us, says that the materials do not at present exist which would enable him to treat the subject as he should wish to treat it. He expresses the rather startling opinion that the "destruction of weeds and more careful cultivation would be quite as efficacious in increasing the produce of the State of New York crops as the employment of artificial manures."

UNPRECEDENTED.—Last night we had a high wind and a light shower of rain. To-day I saw a field of wheat that was badly lodged. The greater part of our wheat is more than a foot in height, which is something never before seen in this vicinity, at this season. We have had summer weather for a month—have finished planting potatoes and sowing oats, and are plowing for corn. Peach trees are in full bloom To-day there is a regular "Norther" and the indications are that we are going to have a cold snap.—S. E. H. Milton, Trimble Co., Ky. March, 29.

THE GREAT HORSE SALE, under the auspices and direction of HARK COMSTOCK—Mr. PETER KELLOGG—took place on the 27th and 28th inst. at the American Institute Building, in this City. The highest price realized the first day was brought by Kentucky Prince, $10,700. On the second day, Beaustre by Rysdyk's Hambletonian brought $5,150; King Philip by Jay Gould, $2,900, and Inhernor, dam Lucy, sire Geo. M. Patchen, $1,350. The total sales for the two days amounted to $51.425, and the average of the 93 head sold was $552,95. The grand affair, the best conducted that has ever taken place here, terminated greatly to the satisfaction of all parties.

Literary Miscellany.

MARCH, IN TENNESSEE.

L. O. P.

White, fleecy clouds across the sky are blown
In rapid course the wild wind flies to-day;
But who would sing the praise of March, you say?
No need, I know; he surely sings his own.

Now hear him trumpeting his deeds about!
Now whistling low a sweet and merry tune,
Now breathing soft as any lady June,
And ending with a wild and joyous shout.

He moves the shapely cedar's heart with sighs,
He stirs the shining holly leaves and box;
Now, trilling with the bright blue-birds, in flocks,
Now catching up the mocking-birds' replies.

He stands in awe of grave magnolia's ways,
But darts his piercing, shining shafts of gold
Upon brown buds that certain promise hold
Of cups of snowy bloom in later days.

He creeps along the grave-yard's grassy slopes;
We may not know what whisperings he hears;
What throbbing hearts of half-forgotten years:
What struggling hands of buried loves and hopes.

He wrests dead leaves from off the parent bough.
And vainly tries the wretched wrecks entomb;
They dance with him on beds of violet bloom,
Now kiss the hyacinths, and lips of crocus now.

So jolly, rough and wild each passing day,
So tender, true and kind in quiet hours,
So wooing round our pathway birds and flowers,
Oh, March! we wish you good-speed on your way.

MY STEP-SON.

MARGARET SCOTT M'RITCHIE.

I had been married just a year when my life experienced its first great trouble—a trouble self-increased by the willful pride and rebellion with which my headstrong girlhood met it.

Hitherto my path had been particularly sunny. The only child of wealthy and indulgent parents, I became engaged when eighteen years old to Kendal Darcy, a rising barrister, some years my senior, whom I loved with a warmth only equaled by my satisfaction when I found that the affection was mutual. My father warned him that such a spoilt child would prove troublesome; but Kendal had no fears on that point, and as yet our wedded life had cast little enough of shadow upon us.

Now and then I did indeed notice upon my husband's face a grave, preoccupied expression that I failed to understand, but I knew he was intrusted with important issues, and, loving his profession as he did, it was no wonder that his mind should entertain its concerns even when he rested from its duties in his beautiful home at South Kensington. I guessed not that scenes in his past life were the phantoms so frequently arising before him, haunting him even in his present happiness, unsuspected by his joyous girl-wife.

I was now about twenty years old, and happier than ever, for a beautiful infant boy had crept into life and love. Ah, what marvelous hopes clustered round the rose-pink *berceaunette* wherein reposed what the papers announced as our "son and heir!" Kendal used to pluch my cheeks, calling us a couple of babies, when he watched us together; but I knew he was as proud of our little Frank as myself, though his smile was so quiet and his looks were so subdued as he held the wee dimpled hand in his own.

Never shall I forget the morning when we became aware that baby was not the "son and heir"—that Kendal had a living son, and that I was a step-mother. We were breakfasting together in our favorite room, and the flowers were nodding in at us through the open windows, while the canaries sang their sweetest, when my husband received a black-bordered letter that turned his face ghastly white as he perused it. I hurried to get him brandy, fearing he was going to faint. I guessed that something was amiss in his banking or professional affairs, but I could not annoy him with questions, and silently I knelt beside him, putting my arms around him.

The story was told by-and-by, quickly and abruptly; but it was very long ere I realized the truth—that I was a second wife. In the early days of our acquaintance Kendal had heard me speak disparagingly of a friend's marriage, vowing that nothing should induce me to marry a widower; it was then that he had most unfortunately resolved to keep the fact of his previous marriage private; and I could well understand how much suffering the deception had caused him.

As a youth of twenty-one he had met his first wife, the pretty daughter of a yeoman-farmer, and the belle of the village where his guardian Col. Grant resided. Home from college for his vacation, he was delighted for so pleasant an acquaintance to beguile the tedium of his stay at the Hall, and their dance at the harvest-home was the prelude to a very warm friendship. Their constant meetings in the sunny meadows and shady lanes were a most agreeable change from the hard studies in which Kendal had been engaged. No word save sympathetic friendship had been exchanged between them when he returned to college; but, while his labors there soon drove his pretty companion from his mind, her weaker nature was completely changed by the past few weeks. By-and-by he was recalled to the village by a stern note from his guardian, who informed him on arrival that Alice Graham was believed to be in a hopeless consumption, and that she had despairingly betrayed the secret of her love to her mother, who had, unknown to herself, appealed to Col. Grant for his advice. Kendal was shocked indeed when he saw the change in the girl he had left so rosy and blooming; and, though he knew he did not deserve all the blame his guardian and her friends evidently considered his due, he could not hold himself entirely innocent in the matter.

It was a sad affair. My husband spoke of it with trembling voice, and in deep agitation. It seemed as though the very tendrils of Alice Graham's life were twined round one who realized now that pity was the utmost feeling of his heart towards her. Her father insisted on marriage; his strictly honorable guardian advised the same course, seeing that "the difference of station had not prevented the courting." Her mother "didna speak, but she looked in his face till his heart was like to break," while the village doctor believed it was the one chance for her cure, and Alice herself, on hearing whispers of such a scheme, appeared quite a new creature.

Kendal was married then in obedience to Colonel Grant's wishes and the promptings of his own good feeling, and, on his guardian's death from a fall in the hunting-field, he came into possession of a substantial provision. His legal studies had kept him much away from home, but he always treated his wife with the kindest consideration, and it was a real grief to him when, in consequence of the sudden tidings of Colonel Grant's accident, a premature birth cost the young mother her life. The baby-boy became Kendal's one solace in his double loss. I knew too well what he felt when he held his first-born in his arms, and my heart grew dry and hard at the thought that such emotions had been excited by another than my little Frank.

As Kendal's duties called him away from the village, Alice's mother proposed to take charge of the baby; and, seeing that she had lately adopted an orphan baby of a late neighbor and that it was thriving most admirably, he readily agreed to allow her a certain sum for the child's support. In a year or two however he intended to take a London house for himself, and he made it distinctly understood that the child was to leave his grandparents then to be brought up under his father's roof.

About nine months had elapsed, when he heard from Mrs. Graham that the child had succumbed to an attack of croup. Wifeless and childless, he hurried down to look upon the tiny new-made grave, close to that of the mother—for little Willie was already buried. The farmer was ill with rheumatic fever, and Mrs. Graham was so worried and upset that Kendal did not speak with her long. He put away the past from him as a dream, and from that day to this he had never brought himself to visit the neighborhood again.

What, then, were his feelings on reading the letter received this morning? It was from the Vicar of Springmead, announcing the death of the aged woman Graham, who had been long a widow, and inclosing a letter addressed to "Willie's Father." During her last illness she had fully confessed to the clergyman the imposture of which she had been guilty, begging however that it might not be revealed to her son-in-law till she had passed beyond his wrath. Kendal's boy was still alive and nearly seven years old; it was her neighbor's child that had died in infancy, but her great love for her grandson and dread of losing him had tempted her to take advantage of the circumstance to retain her darling with her. The Vicar had soon traced Mr. Darcy, the barrister, to his abode, and he wrote that Mrs. Graham, even at the last, did not seem to realize the extent of her wrong-doing; it seemed to her partly excused by the indulgent care lavished on the child she had taught to call her "grannie," and by the fact that she had never accepted the help of a farthing from her son-in-law since she had imposed upon him. Since her husband's death the small farm had suffered great misfortunes; it appeared that it was now to be sold, and the proceeds were to pay the debts the widow's slender means had forced her to contract.

"My blue-eyed baby alive," cried Kendal, as if speaking to himself—"given back to me as it were from the grave! I can even forgive the cruel wrong in the joy that is swallowing up every other feeling—the joy to know that my son is not dead!"

At that moment I almost hated my husband; his heart seemed so far from me and my baby that a passion of jealous anger seemed rending my soul. With bitter cutting words did I reproach him for his deceit, and his only answer was a silent look of pain; but when, incensed by his quiet manner, I began to hint that the child's training had not been such as to fit him for our house, I saw my husband angry with me for the first time in his life.

"A child of six or seven," said he, "can scarcely be considered as trained to perfection—even Frank at that age will sometimes need our fond correction; but I suppose he will be no less our much-loved son."

"Frank has nothing to do with the present," was my haughty reply; "my son will always be a gentleman."

I was ashamed of my words as soon as spoken, but Kendal made no reply. He walked up and down the room for several minutes ere he said—

"I am going down to Springmead to-day, and shall probably bring Willie home on Wednesday evening. Come, mamma," he added tenderly, "I know I can trust your woman's heart towards him."

"You are mistaken," rejoined I quickly, "if you suppose I shall trouble myself in the least concerning him. I never arranged for the trying life of a step-mother. Frank's nurse has quite enough to do. But the boy is old enough to attend to himself now. If you take my advice, you will send him to a thoroughly select school for some time before you bring him home."

"You must allow me to decide that matter," said Kendal coldly. "My house is my son's home. I will take care that no trouble concerning him shall fall upon yourself or nurse. Millicent"—and he tried to take my hand—"do not let us prolong our first disagreement. You must know how deep is my love for my wife and our baby, but you would despise me in your heart if I felt no yearning towards my first-born."

"I have no wish to make matters unpleasant," returned I, withdrawing my hand. "I only wish to know where the child is to sleep, for nurse will object to have another in the nursery, and the rooms are all disposed of."

"He can have the small red room for a bedroom," answered Kendal curtly.

I had always meant to turn this room into a day-nursery by-and-by, and I was not at all pleased to find my plans frustrated. Without another word or look towards my husband, I hurried up stairs to my baby to pour into his unconscious ears all my indignant and tumultuous feelings.

My husband tried no more to reconcile me to the fact of the child's residence with us. I saw that he was as displeased with my conduct as I was with his. But surely I had reason to be angry. Not only was I a second wife—a position to which I had a strong objection—but a vulgar farm-bred boy was to come among among us, stealing from my baby the father's love and the rights of the first-born that should have been his.

Bitter tears did I shed that day beside the cradle when Kendal had left for Springmead with a "Good-by, Millicent," called from the bottom of the stairs. I imagined that I had already become less dear to him, and laid the whole blame of the unpleasantness upon the boy who had come between us.

"Never mind, my baby!" I cried, pressing my lips to little Frank's velvet cheek. "We will love and comfort one another through it all."

On Wednesday morning I received a long fond letter from my husband, full of tender words for myself and baby, blaming himself for his secrecy, and pleading very hard for a mother's love for his son, however troublesome he might prove at first. He said that he had already seen my parents, having stopped for that purpose when half-way to Springmead, and that they had treated him with forbearing kindness he could never forget. Instead of adding this letter to the precious packet in my dressing-case, I tore it up after the first perusal; I was far too angry with my fate to be just towards my husband.

I asked my cousin Mrs. Tudor to spend the day with me, and she came to lunch, accompanied by her two children, and her sister Miss Clemence—their presence would take away some of the awkward nervousness with which I looked forward to Kendal's return. I did not enlarge on the facts of the case, but told them simply that Mr. Darcy had been deceived as to the death of his first wife's child, taking it for granted that they were aware of a previous marriage. My cousins showed neither surprise nor curiosity, whatever their feelings may have been. Miss Clemence hoped Willie would be a good boy, and give me no annoyance; and Mrs. Tudor, turning to her boy and girl, expensively dressed in the hight of fashion, hoped they would be good friends with the new cousin that they would see that evening.

It was nearly six o'clock when a cab drove up to the door, and I heard my husband's voice through the open window. A tastefully-spread tea waited upon the table—for we had made the luncheon our dinner, as Archie and Beatrice Tudor could not be kept out late. We were laughing and chatting pleasantly when Kendal came in; little Frank, in his very best lace robe, lay fast asleep in my lap, and I had no intention of waking him by disturbing my position in any way.

My husband greeted my relatives very cordially, though I fancy he was disagreeably surprised at their presence; at any rate, he went back into the hall, saying, "Run up stairs with Martha, Willie, and get yourself tidy, for the tea is quite ready."

"I have engaged a nurse for Willie at a registry-office," said Kendal to me in an undertone; "he is far from strong, and Martha will see to him entirely. Sturdy fellow this!" he added, turning to Miss Clemence as he bent to kiss the baby.

I knew that he wanted me to look at him, that he might read my feelings in my eyes, but I kept my face resolutely bent down, in deep displeasure that a servant had been added to our household independently of my own will and choice.

Kendal was thoroughly nervous when he brought his son into the room, and bade him shake hands all round. My careless glance as I touched his hand revealed a thin, pale child, very awkward and frightened, in a black sailor-suit of country make, presenting a marked contrast to the self-possessed little Tudors who stared at him with the curiosity incident to their age. It was a relief that he was not vulgar-looking; however I chose to mistake his shyness for ill-breeding, and determined to punish Kendal thoroughly through the child. Little Willie sat beside his father at tea, and, finding his child so little noticed, Kendal lavished upon him a fondness that inflamed my jealousy every moment. His first choice at table being a slice of very rich cake, of which the smallest morsel was sufficient for children, my husband, with the thoughtlessness of a man, heaped his plate with it. I knew that such a meal after a long journey would certainly harm the boy, but I had not the grace to clothe my remonstrance pleasantly. I turned to Kendal with the cold remark—

"That slice should be divided between the three children; no child should eat so much rich cake."

"It won't hurt Willie," said Kendal obstinately; and, without noticing me further, he turned to converse with Mrs. Tudor.

I noticed however that after the first taste little Willie only crumbled his food, gazing round the table with crimsoning cheeks, and gulping down his tea as though forcing back something in his throat. I was becoming as nervous as the child, for I had a horror of scenes, and I knew very well what was coming.

"Eat your cake, Willie, like a man," said my husband, as a lull in the conversation took place.

"I am afraid he has a very poor appetite," remarked Miss Clemence; "he has eaten nothing as yet."

Dismayed to find himself the object of general attention, Willie hastily swallowed a piece of cake, and then what I had forseen took place He buried his face in his small thin hands, and pushing away his plate, burst out crying. If my husband had been absent, I must have taken the motherless boy in my arms and hushed him as I did my own Frank; as it was, I looked at the sleeping child on the couch, and remarked that he would be ill all night if suddenly awakened. Miss Clemence told Willie nobody would love him if he was not well-behaved; Mrs. Tudor said something about "spoilt children;" Archie abruptly produced a stick of chocolate from his pocket and forced it between Willie's fingers, and little Beatrice twined her arms around his neck, whispering, "Please don't cry cousin."

"The child is tired," said I; "he cries only from fatigue. He had better go to bed and have something to eat there."

Kendal was very much annoyed at this public manifestation. He gave me a look almost of disgust at the indifference of my tones, and then, raising Willie gently in his arms, he carried him away. The last sound I heard was, "Grannie! I do want grannie!" and the wailing cry haunted me throughout the evening.

From that time a great coldness arose between my husband and myself; while outwardly the same united couple, both were conscious that a barrier, in the shape of little Willie, really separated us. It so happened that this was term-time, when Kendal was constantly occupied from home; but, when we were together, I easily recognized the absence of his former little tendernesses, and my heart grew harder and harder against the child who, I chose to believe, had usurped my place.

Willie was left entirely to the management of his nurse, a person whose cringing manners toward myself at once prejudiced me against her. She was constantly complaining to me of the willfulness of her charge, and I told her at last that he had been under her sole control for several weeks, and I had hoped for a report of a slight improvement at least. My great wish was to get the child away to school; evil passions once encouraged pervert the better nature, and, despite the occasional whispers of conscience, I threw off all responsibility concerning him, disliking even the sound of his voice or the mention of his name. If Kendal was displeased with his home-training, why did he not send him away?

"That boy is always crying," said my husband irritably one morning, as he pulled on his gloves in the hall. "I wonder what is the matter now."

"It is perfectly dreadful at his age," returned I. "Mamma will be here next week, and I am sure the noise will quite upset her."

"Willie must go to school next quarter," said he; "it will be altogether better for him than this house."

He turned toward the door, for our fond adieux were things of the past; but I saw before us a return of the old happy days, when Willie should no longer be an ever-present source of disagreement, and my heart went out yearningly toward my husband.

"You might spare me a kiss said I, coloring and I put my hand on his arm.

There was a sort of affection in his look, as he answered sternly—

"When I have once seen you kiss my child, I shall know you care for such tokens from me. Till then, let neither of us pretend regard, Millicent."

"Be it so," said I, white with angry pride. "You will never see me kiss that boy. I hate the very sight of him!"

"Take care of what you are saying," remarked Kendal quietly; "those are dangerous words to utter."

He had just left the house when Willie's screaming reached a higher pitch than ever, and I hurried up-stairs in a rage, determined to exercise my authority for once, to show the child such an annoyance was unbearable. Pushing open the door of the room where Martha gave him his meals, I beheld a scene that fully accounted for his cries. The nurse held both his wrists in a cruel grasp, and was beating him unmercifully about the head.

"Say I'm tipsy again, you rascal!" said she in thick, stupid tones. "You'll tell your pa I was tipsy all night, will you, when I was rolling in agony with the spasms? I've half a mind to kill you, I have—and I will too, if you go tale-bearing to your pa!"

I wrenched the child from her hold, and confronted the astonished woman. My fear of intoxication was completely overpowered by my indignation, and I spoke calmly and decisively.

"Go to bed, Martha; you are unfit for your duties to-day. When you are better, I shall see you again."

Her angry gaze changed slowly into a dull stare as she perceived my firm expression, and she sank into an arm-chair, where I knew she would sleep off the effects of her over-indulgence. I slipped the door-key into my pocket, and retreated, in my excitement carrying Willie as easily as an infant. Frank's nurse looked thoroughly surprised when I entered her domain with my step-son sobbing hysterically in my arms; but my recital did not astonish her.

"I had no idea it was as bad as that, ma'am," said nurse, "for Martha keeps herself to herself, and seldom allows her fellow-servants inside her rooms; but we all suspected she drank, for we smelt spirits often enough."

"But why did nobody tell me?" I asked crying myself as nurse gently revealed the blue marks on Willie's shoulders. "This child has been treated barbarously."

"Well, ma'am, we didn't think it our place to carry tales so long as you were satisfied. Many a time have I told Martha that Master Willie didn't ought to cry so much, but she always said she had your permission to punish him as she chose when he was troublesome."

I felt the reproach her words conveyed to my conscience, and I knew it was deserved.

"Get him some breakfast, nurse," said I; "the things were only half laid on the table, and he has had nothing this morning. Now, Willie, I want to know all about Martha—come, tell mamma everything."

"She hasn't been quite so bad before," replied the little fellow, looking up into my face, "but she is always sipping some stuff from a bottle in her pocket, and it makes her so cross. Last night she was angry because I was in here playing with baby, and she sent me to bed without supper. She said that I took tales to the other servants, and that I had no business here; she told me you wouldn't have me touch baby because I was only his step-brother, and I was in his way, and you'd be glad if I was dead—but that's a story, isn't it?"

He fastened upon me his great earnest blue eyes, just like my husband's. I was crying fast—crying away all my unnatural hardness—and for answer I stooped down and kissed him.

"I knew it was a story," said Willie, "I do like you to nurse me, mamma; it feels like grannie."

"Did Martha dress you this morning, Master Willie?" asked nurse, returning with some bread and milk and a little minced chicken.

"No, she sat up in the chair all night. She was asleep there this morning when I went to see if breakfast was ready. I had dressed myself, and I woke her up and told her so. I began to cry, and said she was tipsy when she stared so oddly at me, and then she hit me because I tried to get away to tell papa."

"Master told me I was never to interfere with Martha, but just attend to baby," said nurse indignantly, "else I'd have found out directly why he was screaming. Never mind, Master Willie; it's all right now."

"Nurse," suggested I, "I think we could have Master Willie's little bed in here. I wish you could undertake both the children, or, at least, try it for a time. I can rely on you, and of course your wages would be altered. He would not be much in your way."

"I am quite agreeable, ma'am," said nurse. "Baby has taken wonderfully to Master Willie, and he always does what I tell him; but I can't have that naughty cough in my nursery, sir, I tell you."

"I don't cough for fun, nurse," declared Willie. "I'll try to keep quiet—I will indeed."

"He has a nasty hacking cough at nights," said nurse to me, when Willie, with the tears all dried, was playing bo-peep with baby in the *berbeaunette*. "It goes right through you, ma'am. I doubt if he's long for this world after all."

"What a foolish idea!" said I hastily, looking at the white face and slender frame, and wondering, with a sudden flash of horror, if my lack of love was thus to be punished by Heaven. The womanly yearnings, crushed hitherto by jealousy, broke down every barrier then. I was myself at last, and my heart opened wide to take in my husband's child.

I longed to see and speak to Kendal again, and looked forward anxiously to his return. I was sadly disappointed when Mr. Tudor came in to tell me that my husband, who shared his chambers, had been summoned to Exeter on legal business and might be detained some days. He had sent a list of certain requisites, and these I packed at once and despatched to the station to follow him. I could not bring myself to write one line of all that I felt.

Mr. Tudor soon relieved my disquietude as to dealing with Martha. After a brief interview between them, in which he acted for Kendal, she quietly accepted a month's money in lieu of notice, and bestowed herself and her belongings in a cab, with a few threats and impertinences concerning myself and her late situation which highly amused the cabman.

"She's gone!" shouted Willie, clapping his thin hands for joy. "Won't I have a good time now, mamma?"

After this Willie's health did not seem to improve, and, broken-hearted, I realized one morning, as the rising sun was parting the gray clouds in the east, that all my care for my patient was in vain. A slight attack of pleurisy, anxiously watched by myself and a West-end physician I had summoned, had taken a fatal turn on the previous evening, and we had telegraphed directly to his father, who had proceeded to Ireland from Exeter.

Closer my boy clung to me with all his feeble strength. Baby was crying in the nursery, missing my presence there; but even his voice could not draw me from that bed-side. I would have died myself to save my other child, cut off in the very blossom of his days—a victim perhaps to the neglect which had left his warning cough unattended to. Unspeakly dear had Kendal's son become to me of late; his innocent lips had prattled to me of better things than my careless thoughts had hitherto heeded.

One evening footsteps came hurrying up-stairs, and I was quickly pushed aside by my husband's hand. I knew what his first-born was to him as I noticed his evident distress. His emotion palsied the child, who was placid himself with the shadow of coming peace.

"Doctor Steane, tell me there is hope—there must be hope—there must be hope!" appealed my husband to the physician, who stood at the foot of the bed.

"I'm not afraid, papa dear," said Willie faintly, as Doctor Steane sadly shook his head.

"But I cannot let you go, my poor little boy!"

A solemn silence fell over us, broken only by my husband's sobs; my own heart was too full to find relief in tears. I started convulsively when at the last there came a great cry, "My mamma!" and the little arms were stretched towards me. How could I ever have wilfully put away my boy's tenderness? Just then I would at any cost have purchased a renewal of our term of love.

The rest is all to me as a dream—a vision of frightened faces, morning shadows superseding the candlelight, and a little figure calm as the flowers on which the the sun was rising—an indistinct memory of stifled sobs, agitated whispers, a baby's cries, and through it all a boy's clear voice faintly recalling his daily prayer—

"Gentle Jesus, meek and mild,
Look upon a little child."

I knew I was forgiven as I stood in the stillness of the solemn room and tenderly looked my last look at him who would so soon be removed from our sight. The heavenly calm of little Willie's face spoke peace to my troubled soul; the love that had given him rest held pardon too for me. I could not bear to remain there long; one mother's kiss I gave him—a parting kiss that refused to part—and then I left him as before, with the pure white roses strewn around him and the lilies on his breast. And my husband, who had followed me unperceived, took me in his arms with a fondness that had a new element in it.

"Dear love," said he, pressing his lips to mine, "I have learnt all now; and what remains untold I read in his eyes that morning as he looked upon you. Heaven reward you, my Millicent!"

I put down my head upon his shoulder and cried there for the first time since our sorrow—cried out all the feelings I had no words to tell.

CORA.

"I WENT to The Tryst and found you gone," he said quietly, lowering his tone a little; and having handed tea to Mrs Colston and Lucie, he came back for his own cup. "Has your brother left England?"

"Harold has gone to Rome," she replied, trying to speak unconcernedly, and to prevent her hands from trembling as she poured out the tea and handed it to him. "He had an unusually good opportunity of studying, and I urged him to accept it."

"He was wise not to take you. Rome is neither agreeable nor healthy at this season."

A momentary silence ensued.

"I did not think to meet you here to-day," he said then. "How long are you to remain here, Cora? I beg your pardon," he added, quickly.

"Harold may be away, two, or perhaps, three months," she replied looking a little troubled and sorrowful.

"You are happy here?"

"Mrs. Colston is very kind," she answered, quietly.

"Do you know what I felt when I went to The Tryst and found it empty?" he said, speaking in low, eager tones, as he bent slightly forward. "Do you know what it costs me to meet you thus?"

"Hush!" she murmured; "I pray you do not speak thus, Lord Almane."

"Ah, forgive me," he rejoined, quickly; "but you said we might be friends, and now, in your brother's absence you must let me be your friend. Are you alone here?"

"Yes. My brother took Marianna to Rome," she answered. "She longed to see her country."

Again there was a silence, then, with a heavy sigh, the Viscount set down his cup, and moved away. In a moment he came back to her side.

"See," he whispered, eagerly; "I am trying to do as you wished, Cora. Lucie is happy, and you wished her happiness more than mine."

"Not more, ah, not more," she replied, gently. "I wish yours above all earthly things."

She spoke the last sentence in a low tone of restrained earnestness; the dark, handsome face lighted up.

"I will remind you of these words some day,' he answered. "Cora, such love as I have for you cannot be vain; since that day when we parted, that night when I last held your hand in mine, I have known no happy moment. You are a woman, and can forget. I can never do so."

Cora's face warned him that unless he wished her emotion to be remarked he must cease now; but one question more he must ask.

"Did your brother know of our love?" he asked, with repressed anxiety.

"Oh, no. How could he?" whispered Cora, raising her eyes for a moment.

"Because Marianna knew of it," he replied, and moved away from her, leaving Cora surprised and uneasy, and wondering why the old nurse had not told her that she had discovered her secret.

Lucie Belmont had been surprised and delighted with Cora's beauty; she had not a spark of selfishness in her nature, and not a particle of envy mingled with the honest admiration she felt for the girl's great loveliness. Besides, her trust in her cousin, her faith in his love and honor, were too entire to allow her to be jealous; and it never entered her head that it was dangerous to either the Viscount or to the girl herself to be much in each other's society. She had been drawn towards Cora on their very first meeting by the witching sweetness of the wistful, almost mournful eyes which had met hers, and she gratified her desire for more of the girl's society in every possible manner.

Almost against her will Cora found herself a constant visitor at Lady Martyn's—a constant visitor and a most welcome guest. The old lady was charmed with her, and with the simple grace, the unconscious dignity, which characterised her every movement—with the quiet repose of her manner, the dainty simplicity of her dress; which were all so different from "the girls of the period," for whom Lady Martyn entertained such a righteous horror. She was always kind and cordial to Cora, and the girl was pleased to escape from the pompous fussiness and glare of the stuccoed Brixton mansion for the quiet, harmonious calm of the well-appointed West-end household, over which the stately old lady presided with such perfect courtesy and high breeding.

These visits had, too, a dangerous charm for Cora; although, after that first day, Lord Almane had carefully avoided any direct allusion to his affection for her. It was pleasant to her to see him, to hear his voice, to touch his hand, and feel for one moment of greeting or parting its lingering pressure over hers; to note that, careful as he seemed not to alarm her or remind her of the past, his voice softened, and took a lower, more caressing intonation even, when he made a trivial remark to her.

Cora was too young to see the folly of it—the danger of playing with edged-tools. She was happier in his society than when he was absent; and with an imprudent disregard of the future, she gave herself up to the pleasure of the present.

It was a pleasant day-dream, but the awakening was exceedingly bitter.

CHAPTER IX.

The hot July sun was pouring its fierce rays through the stained windows of the old dilapidated palace in the neighborhood of Rome, and large and lofty as the rooms within were, it was powerful enough to be unpleasantly felt, especially in one, which surely had served as an oratory in the old days of grandeur and magnificence, for it faced the east. It was a vaulted room; ceiling as well as walls richly decorated with frescoes, whose colors had faded and grown so dim with passing years that even the subjects of the paintings could hardly be discovered. There was a good deal of gilding, now tarnished and soiled, about the room; the floor was marble, and handsomely inlaid, but it made but a comfortless bed-room for any one suffering and in pain. The furniture matched the room itself for faded splendor and magnificence; the windows were uncurtained, but they needed but little shading, for the glass was stained with the rich colors and designs of a bygone age—colors which, with all our progress and advancement, we cannot surpass now.

The doors were thrown wide open, but they admitted no air, and Harold Sinclair, lying on the old couch near the open windows, sighed impatiently as he felt the parching heat around him.

His stay at Rome had greatly changed the young artist; almost from the earliest period of his residence there he had felt the bad effects of the intense heat; but he had disregarded, in his professional ardor and eagerness to complete his studies, the growing langor and debility which were coming over him, and it was only when he was perfectly prostrate with the low fever of the country that he recognized that he had been imprudent and careless.

That he was very ill, no one who watched him could deny; he was dreadfully weakened and emaciated, and dark violet circles had hollowed themselves out under the blue eyes, and a hectic flush burned on the thin cheeks. His companions and brother artists had been kind and attentive enough, but during Marianna's absence at her own home, a little village not far from Florence, Harold's chief friend and nurse was a young Englishman, who was studying sculpture at Rome and who had delayed his departure on purpose to be of use to the sick man.

Sitting beside him, with the volume of Tasso, which he had been reading to Harold, who had closed his eyes in weariness or sleep, resting on his knee, Sir Alan Vincent contemplated, sadly enough, the worn face, and thin white fingers, and unconsciously contrasted them with his own muscular hand. He himself was an unusually powerful specimen of the *genus homo*. He was over six feet high, broad in proportion, and splendidly built. As he strode through the streets, many an Italian painter and sculptor turned to admire the stately proportions, and to mark the resemblance between him and the statues of the brawny gladiators who had striven and wrestled in the arena of the Roman forum.

They liked him, too, as much as they admired him. They were pleased by his cordial, hearty, and yet gentle manner; the perfect straightforwardness and uprightness of every word and action they could appreciate, though they might not feel inclined to follow his example. Harold had liked him specially; during the period of their acquaintance they had been great chums, and when he had fallen ill, Sir Alan had become his kindest and most constant attendant.

There were others, too, of his party who were kind and attentive. George Leeson, who had been one of the chief originators of the visit to Rome, had been especially so also, but Harold preferred Sir Alan; he liked to feel some one so strong and yet so gentle about him, he said.

They were aroused, the one from his doze, the other from his reverie, by the entrance of the doctor, a quiet, elderly Englishman, whom both men liked and trusted. Harold greeted him with a faint smile; but he was too weak even to stretch out his hand in greeting. The doctor made his inquiries in a cheery tone, but Sir Alan Vincent, watching his face, saw that, as he proceeded with his examination, a shade came over it, a shade of sorrow, pity and regret. He waited a few moments, chatted about trivial matters, all the time watching Harold's face with close attention and then prepared to take his leave.

"I am coming round this way in the evening," he said; "will you give me some coffee if I look in? Good-bye until then."

Sir Alan followed him out, and in the lofty, marble vestibule of the old palace, both men paused.

"You think him very ill, doctor?" said Sir Alan, in anxious inquiry.

"Yes," the other replied, with a grave shake of the head; "I fear there is but little chance of rallying. Has he no friends—no relatives who would come to him?"

"You do not think it is so bad as that?" exclaimed the baronet, greatly shocked. "He is so young; surely there must be hope."

"I have but little," was the sad reply. "I do not say there is none; but it is a very faint one, Sir Alan. I think he ought to send for his people.

"He has only a sister, I believe," said Sir Alan, mournfully.

"Why is she not here?" said the doctor, quickly.

"She does not know he is ill," was the answer. 'He seems passionately devoted to her, and anxious to avoid giving her any anxiety. Even yesterday he insisted on writing her a few lines, pleading press of work, and not saying one word about his health."

"She should be sent for," said the physician. "If she cares for him, it is cruel to keep her in ignorance of his danger, Sir Alan. As his friend, you ought to send for her."

"He is afraid of the malaria for her as well," answered Sir Alan. "Must I really broach the subject to him?"

"I think it is your duty to do so," was the reply. "Try to alarm him as little as possible. I will call again this evening."

Sir Alan returned to Harold's bedside, trying in vain to show no trace of his discomfiture and sorrow at the doctor's tidings. To him, in the flush of health and strength, it was terrible to think that this man, whom he had known a few weeks since, well and strong as himself, should be dangerously ill, sick unto death; and notwithstanding all his efforts, his face was very grave and disturbed as he returned to the sick-room.

Harold was lying with closed eyes, and a sorrowful expression on his face, although, during his illness, he had been generally cheerful.

He did not speak when his friend entered; but when Sir Alan arranged his pillows with a tenderness and lightness of touch few women could have excelled, he opened his eyes, and smiled.

"What a fellow you are, Vincent," he said, looking at him with wistful wonder and admiration in his eyes. "Such a giant for strength, and yet with such a gentle touch. Why Cora's own little fingers could not be gentler."

His words gave the baronet the opening he needed; but for a moment his voice faltered so that he could not speak.

"What's the matter, old fellow?" said Harold, in his faint voice.

"Nothing, of course," was the quick answer. "I wonder you don't send for your sister, Sinclair; it would be so much pleasanter for you to have her than a great clumsy fellow like me."

"It would be selfish to bring the child to Rome at such a season," said Harold, musingly.

"But the great heat is dying away," said Sir Alan. "It will soon be cooler, and I think it is hardly fair to keep her in ignorance of your illness."

Sir Alan was a bad dissembler. As he spoke, his earnest gray eyes avoided Harold's glance, and the color mounted to his usually pale cheek.

Harold was too quick not to note the uneasy manner; but, for a moment, he did not reply.

"Are you getting tired of your sick-room attendance, Alan?" he said then, a little wistfully, but with a great deal of affection in his tone.

The baronet flushed deeply, as he answered at once;

"By no means, Sinclair! but,——"

"I know, old fellow," interrupted the invalid. There was a short silence.

"That was an ungrateful speech of mine," said Harold in a minute. "Forget it, Alan. Never had any one a kinder, truer friend than you have proved yourself."

"Nonsense," was the reply.

But Sir Alan put his strong hand on Harold's and his slender, weak fingers closed over it.

"What has Dr. Crosby been saying to you?" said Harold with a faint smile. "Did he tell you I was dying, old fellow?"

"I shall begin to think that you are raving if you talk such nonsense," said Alan, with an impatient movement.

"You cannot disguise it, Alan. Why should you? I have thought it some days myself, and always with the most earnest thankfulness that I had you with me to help me through it, and to break the news to my poor Cora now, and, if you will, to be a friend to her when I am gone."

Sir Alan's lip quivered a little, and it was with some difficulty that he spoke again in his light tones.

"I don't know what you have taken into your head, Harold," he said, "but I think you are getting light-headed. I only know this, that if I had an only sister whom I cared two straws about, I would not do her the injustice of keeping an illness from her. I tell you, Hal, that if I were ill, and situated as you are, the very first thing I should do would be to send to my mother, and she is a delicate old lady; and your sister is not either the one or the other."

"Shall I send for Marianna?" said Harold, smiling faintly. "Will that satisfy you?"

"Send for her by all means, old fellow, but don't behave so cruelly to your sister."

"You are strangely persistent, Alan," murmured Harold, smiling faintly; and then he closed his eyes, and Sir Alan desisted, feeling that he had failed ignominiously in carrying out the physician's wishes.

The hours passed by slowly. Harold lay silent, and apparently asleep, while Sir Alan kept his motionless station and guard by the bedside, rising sometimes to moisten the parched lips, or to make the sick man take some light nourishment.

Twice he was disturbed by visitors. First came the old Italian maestro with whom they were studying, very sorrowful at the illness of his most promising pupil, and a little annoyed with Sir Alan Vincent for allowing his friendship to surpass his ardor for art, and so missing his own golden opportunities and hours of study, for Sir Alan was a sculptor and a diligent worker. After him came George Leoson to cheer the invalid with studio chit-chat and art *jargon*, which amused and brightened Harold for the moment. But after he was gone the exhaustion and langor were still more apparent, and Sir Alan rather anxiously awaited Dr. Crosby's next visit.

The physician came and went, going away with a very anxious face; and Sir Alan, returning to his mournful watch by the bedside, felt his heart sink and grow heavy as he noticed the sharpened profile and the shade on the handsome face.

Towards evening Harold roused up. The last rays of sunset stole in through the open door, and lingered over the faded paintings on the walls, and a faint, pleasant air had sprung up, and played refreshingly over the sick man's brow as he opened his eyes, and met Alan's anxious glance with a faint smile.

An Italian servant belonging to the house had come up with a pleasant inquiry after the *Signor Inglese*, and a graceful present of fruit—luscious purple grapes, with the bloom on them, and some peaches ripened into sweetness and richness under the hot southern sun.

Harold had murmured his thanks, and given the lad a pleasant smile, but it had not prevented Tonio's dark, bright eyes from filling with ready tears, and his lips from taking a mournful droop, which hid the gleaming white teeth, as he noticed the change in the invalid.

When he was gone Harold turned to Sir Alan with a playful sadness. He had put his strong arm under the pillows, and was supporting Harold in a sitting posture in such a manner that he was not the least fatigued, and it rested him after such a long spell of a recumbent position.

"Did you see the boy's face, Alan?" he said, smiling faintly. "He, like you, thinks me doomed, old fellow. Do you really advise me to send for the child? I should so like to see her once more."

"Harold, you pain me horribly," said the baronet, entreatingly. "Send for your sister, by all means; by the time she comes you will be convalescent, and she will be here just as you will be getting disagreeable, and trying all our patience to the uttermost."

"Well," sighed Harold; "let the child come. Alan, I know you will be good to her if anything happens. You must promise me this."

"My mother shall be as hers, old fellow," said the baronet, gently and tenderly. "Only I won't send for her at all if you get so despouding. I had better write at once to catch the night's post. What is the address, Harold?"

"Nay, if Cora is to come you must go for her," said the sick man, quietly. "How can she come from London alone? and I have no friends there who would bring her to me. The people she is with now are almost strangers to us; but they are very kind to her, and she was so anxious that I should come, Poor Cora!"

"I? How can I leave you, Hal?" said Sir Alan, hesitatingly. "Surely your friends could find her an escort."

"Then that must end it," Said Harold, positively. "I should not like her to come with anyone else."

"But you, Hal?" said Sir Alan, again.

"Marianna would come if you send for her. She and Tonio will surely be enough for me. Alan am I presuming on your friendship in asking you this, the last service I think I shall ever need at your hands!"

"I will bring her," said the baronet, simply.

"Let me go now, Hal, I must tell Tonio to start at once and return with Marianna. When she comes I will start and bring your sister to you with all speed."

And Sir Alan went to make his arrangements, his heart heavy with foredoding. Would Harold Sinclair live to see the sister he loved so tenderly?—[To be continued.]

For Women,

[CONDUCTED BY MISS FAITH RIPLEY.

THE ANSWER.

BY ELIZABETH STUART PHELPS.

"That we together may sail,
Just as we used to do.
—*Carlto n's Ballads.*

And what if I should be kind?
And what if you should be true?
The old love could never go on
Just as it used to do.

The wan, white hands of the waves,
That smote us swift apart,
Will never enclasp again,
And draw us heart to heart.

The cold, far feet of the tides
That trod between us two,
Can never retrace their steps,
And fall where they used to do.

Oh, well the ships must remember,
That go down to the awful sea,
No keel that obisels the current,
Can cut where it used to be.

Not a throb of the gloom or glory
That stirs in the sun or the rain,
Will ever be *that* gloom or glory
That dazzled or darkened—again.

Not a wave that stretches its arms,
And yearns to the breast of the shore,
Is ever the wave that came trusting,
And yearning, and loving, before.

The hope that is high as the heavens,
The joy that is keen as pain,
The faith that is free as the morning,
Can die—but can live not again.

And though I should step beside you,
And hand should lean unto hand
We should walk mutely—stifled—
Ghosts in a breathless land.

For I am as dead as you are,
And you are as dead as I;
He who burns souls down to ashes,
He only can answer why.

And what if I should be kind?
And though you should be true?
The old love could never, never
Love on as it used to do.

—*Andover.*

WASHING-DAY.

MRS. A. E. STORY.

FRIDAY, as we are sagely informed, is hangman's day, an unlucky day, a day on which no new work must be begun, no journey undertaken, no plans for the future laid. For on Friday, of all days,

"The best laid plans of mice and men
Gang aft agley."

Saturday is peaceful, quiet, serene—the day of preparation for the Sabbath. Wednesday and Thursday are the bone and sinew of the week, given to bearing burdens and bearing them silently and without complainings. Tuesday is like Friday, under a ban. But what has the unhappy Monday done, that its groanings must go up in clouds of steam to the very skies! It is ushered in by the seething of boilers, the shrieks of washing-machines, by the din of pounding barrels, by the odor of suds, the crying of babies, and the general discomfort of everybody but the women who are at the head of affairs, and who turn the crank, which is their emblem of authority, with a vigor worthy of the day.

Monday is washing-day.

A woman possessed of any spirit, would sooner be caught in a hail-storm with her best bonnet on than fail to do out her week's washing on Monday.

The very brutes about the house learn to know the day and tremble.

The cat vacates her corner by the stove and curls herself up on a beam in the wood-shed, where, if she sleeps, it is with one eye open. The dog plants himself on the front stoop and howls plaintively. The children go off to school with molasses on their faces and with unbuttoned shirt bands. *Paterfamilias* fills his pipe on the doorsteps and smokes it on the wood-pile. Beds are left unmade, floors unswept, dishes unwashed. The baby has the tongs and the tea-kettle to play with. He pinches his fingers, blacks his face, and tumbles into a pail of water trying to climb on the table.

Pandemonium is let loose. It is washing-day!

At noon the scene is changed. The clothes are on the line. The tubs are put out of sight. The slops have been cleared away. The "good man" has had his "picked-up" dinner and smokes his pipe by the kitchen fire with the baby tugging at his trousers' legs, while the mistress of the day is stretched out on the lounge, completely exhausted but, oh, so happy, for did she not get out her whole wash before so much as a single rag fluttered from one of her neighbors' lines?

She ought to have attended to the churning this morning, she knows, and there was baking that needed doing. The cream will only be a little more sour and the churning larger, that is all, and as to the baking, the children can eat mush and milk for their supper. It is healthy and easy to get. She should, by rights have mended JOHNNY'S jacket. He tore it Saturday afternoon and she *supposes* she ought to call on a friend in whose household there was a death last night, but she cannot let the washing go. JOHNNY can wear his Sunday jacket and her friend must take the will for the deed. What was Monday made for if not that she might wash

Tooth-ache, head-ache, back-ache! she may have all these, but what are they that they should keep her out of the suds? She will do up her jaw in a mustard poultice, bind towels dipped in pain-killer around her head and put porous plasters on her back, but not even this once will she let Mrs. Flyabout or Mrs. Cleansweep get ahead of her with her washing. Seriously, what advantage does Monday have over other days of the week beyond the one conveyed in the old couplet:

"They that wash on Monday
Have all the week to dry,"

for the doing of the family wash? It has numerous disadvantages, not the least of which is the necessity one is under, if the work is to be begun early in the morning, of "picking up" the wash and making other preparations on the Sabbath.

But, wisely or not, custom has uttered a decree and like the laws of the Medes and Persians, it altereth not, and so long as we are slaves to custom we shall go on doing our weekly cleansing of linen on Monday with no regard to our own personal convenience or desires.

TO BE OR NOT TO BE?

JOSEPH.

To what has science brought us? The theories that seem promulgated only to turn the world upside down have reached even to regulating the number of our children, as a wise farmer regulates his stock. It teaches us that our aim in life should be to live at ease, and not spend our lives in the nursery. Such doctrine is very discouraging to many farmers' wives whose hands are full, and who have comforted themselves that "cradle tending" *was one* of woman's highest, noblest duties. Must large families necessarily be "dirty, ill-favored or ignorant?" Is it not rather the result of surroundings? and if differently situated the "brood" might become better citizens than the "solitary American child," brought up to selfishness by its very isolation. Queen VICTORIA had nine children when her husband died in the pride of manhood, and I read in a late RURAL that MURAT HALSTEAD was the father of eleven children, yet with a noble and cultivated wife; and Mr. EVARTS, too, is the father of about the same number, if newspaper reports are true. It is, to say the least, deplorable that women sneer at each other in this respect, or pity their sister women who are mothers of large families. Such feelings expressed are apt to prove as clouds in a weak woman's sunlight. Has she not, through all her hours of trial, been sustained by the thought that each dear, helpless being sent to her weary arms, was a gift from the GOD in whom she trusted? And now, to be told He has no part or lot in the matter!

If the matter of health is taken into consideration, it is only necessary to remember the women of the last generations, who brought up large families and accomplished more work than any three women attempt to-day, to know that it is the childless and those who tamper with GOD'S laws in this respect, who die young, of unexplained diseases, or live for years in a state of invalidism. The one American child, for whom the parents scrape and save—who is made to believe *I* the most important letter in the alphabet—is not likely to grow up as self-helpful, kind or observant as the one among a crowd, who must practice self-denial, protect the weak, and do his share of the work at an early age.

Mrs. Potiphar "talks of scriptural authority" and seems to forget that *all* the Bible through gives as one of the choicest blessings bestowed upon man the gift of *children*. To "increase and multiply" to become the "joyful mother of children," and to "bring them up in the fear of the Lord," are sentences of frequent occurrence in the Bible. But science shuts the Bible on this subject. It is behind the age! Ah! mothers, do not be discouraged by this needless sneer at "nursery" and "cradle-tending." Do you think women are happier in the Court House, on the rostrum, or jostling with men in the galleries or lobby of congressional meetings? It is false to every instinct of our sex to say, yes. Nor can fame so fickle in its favors compensate for a loveless home or the happy faces and voices of children. Take courage. Think still that the GOD of the past is the GOD of the present and that He watches over you and yours. The hymns you sing when cradle-tending give more pure enjoyment than if the applause of a multitude greeted your efforts, for they would forget you when a fresher voice came before them, but your words; your looks, your love, will live in the hearts of your children when they can see you no more. It will require your best and highest nature to make your home a heaven on earth for your dear ones, for nowhere else can a cultivated woman realize such grand possibilites as in training the children GOD has given her.

TURKISH WIVES.

Having obtained a wife, it is worth while to inquire how a Turk treats her. She has not much to complain of generally from the personal ill-treatment of her husband. As a rule the Turk if a fair husband. The Turk in ordinary life is not unkind or cruel. The wife's misfortunes arise from her position. As husband and wife see little of each other, they are not specially given to quarrelling. But she is a woman, possibly purchased outright in the slave-market—for it is a pure illusion to suppose that the slave trade in Turkey has been abolished—and being a woman, she bears about her on every hand the marks of degradation.

It is her duty to wait on her husband, if he is poor, at meals. Her accommodations in the house are inferior to his. In all things she is a slave. If the wife is the daughter of a wealthy man, her lot is not a hard one. As the law regards marriage merely as a patnership, she keeps her own property, and the husband has to be on his good behavior to obtain a share of it. If she is of poor origin, she can scarcely be said to have any rights. When a harem is on board a vessel, the husband keeps in the saloon, living well and sleeping in a comfortable cabin. The poor women are penned up as deck-passengers, living on wretched food which they take with them.

"Only a few weeks ago," says a traveller, "I was in a steamer carrying a harem, where there were probably twenty women wives and slaves, who were shivering under a canvas, which was quite insufficient to keep out the pelting rain. I know that it is a thing almost unknown for a harem to have cabins taken for it. The husband takes care of himself—has perhaps, unlimited champagne—and leaves his women huddled together on deck to take care of themselves:"

THE HEARTS OF THE LOWLY.

ONE day, three or four weeks ago, a gamin, who seemed to have no friends in the world, was run over by a vehicle, on Madison Avenue, New York, and fatally injured. After he had been in the hospital for a week, a boy about his own size, and looking as friendless and forlorn, called to ask about him and leave an orange. He seemed much embarrassed and would answer no questions. After that he came daily, always bringing something, if no more than an apple. Last week, when the nurse told him that Billy had no chance to get well, the strange boy waited around longer than usual, and finally asked if he could go in. He had been invited to many times before, but had always refused. Billy, pale and weak and emaciated, opened his eyes in wonder at the sight of the boy, and before he realized who it was the stranger bent close to his face and sobbed:

"Billy, can ye forgive a feller? We was allus fighting, and I was allus too much for ye; but I'm sorry! 'Fore ye die won't ye tell me ye haven't any grudge agin me?"

The young lad, then almost in the shadow of death, reached up his thin, white arms, clasped them around the other's neck, and replied:

"Don't cry, Rob. Don't feel bad. I was ugly and mean, and I was heaving a stone at ye when the wagon hit me. If ye'll forgive me, I'll forgive you, and I'll pray for both of us."

Bob was half an hour late the morning Billy died. When the nurse took him to the shrouded corpse, he kissed the pale face tenderly, and gasped:

"D-did he say anything about—about mo?"

"He spoke of you just before he died. Asked if you were here," replied the nurse.

"And may I go—go to the funeral?"

"You may."

And he did. He was the only mourner. His heart was the only one that ached. No tears were shed by others, and they left him sitting by the new-made grave, with heart so big that he could not speak.

If under the crust of vice and ignorance there are such springs of pure feeling and true nobility, who shall grow weary of doing good?—*Independent.*

FRECKLES.

The most effectual means of removing freckles, is the use of those chemicals which dissolve the existing combination. The freckles are situated in the middle or second membrane of the skin, and before any other application it will be advisable to soften the surface by the use of some mild balsam or paste.

Paste for freckles—one ounce of bitter almonds, one ditto of barley flour; mix with sufficient quantity of honey to make the whole into a smooth paste, with which the face more particularly where the freckles are visible, is to be anointed at night and the paste washed off in the morning after a few days the skin will be prepared for a chemical remedy.

To decompose the freckles by laying hold of the iron: the following mixture may be applied. Take one drachm of muriatic acid, half a pint of rain water, half a teaspoonful of lavender; mix well together and apply two or three times a day with a camel's hair brush. The acid seizes upon the iron and the oxygen is disengaged.

"JUST LIKE THE SEX!"—"Did I love any other girl?" repeated a prospective bridegroom, in answer to the tearful query of his intended. "Why, darling, of course not; how could you ask such a question? You are my first my only love! This heart knew no waking until the sunshine of your love streamed in, and woke it to ecstasy!" And then he kissed her tenderly and went home, and said to himself: "I must hurry them things out of the way right off, or there'll be a row;" and he collected a great pile of letters, written in all kinds of feminine hands, with lots of faded flowers, and photographs, and locks of hair, and bits of faded ribbon, and other things; and, then the whole collection had been crammed into the kitchen grate, he drew a deep sigh, and said to himself: "There goes all that is left of fourteen undying loves—let 'em flicker!"

—WILL some of your correspondents please tell me through the columns of the RURAL, a remedy for the large black ants which infested my cupboards last summer, and have already, this nice weather, sent out spies, intending no doubt to follow in regiments soon.

Domestic Economy.

CONDUCTED BY EMILY MAPLE

SIFTINGS FROM THE KITCHEN FIRE.

ANNIE L. JACK.

THE month of March has been to us a miracle of alternate smiles and tears, more like the "May" we usually have in Canada. Sowing peas and making hot-beds, is not often our work at this season, for April generally finds the "Kitchen-fire" a necessity, and of permanent value. But for several weeks our cellar doors have been opened wide, to sun and air, the vegetables looked over carefully and only the very best retained. Until asparagus comes I think there is nothing better, as a diet, than good vegetables plentifully used, celery, beets, turnips, parsnips and the good old Hubbard squash, for which Gregory deserves a medal as introducer. Then if apples still hold out and give the children a plentiful supply—there is sulphur in them that as a purifier is superior to, and pleasanter, than the proverbial "brimstone and treacle." If showing signs of decay, there is no better plan for using apples than in a simple form half-preserve half-canned that I will give the readers who are tired of apple sauce. Pare and core, cutting the pieces into as even size and shape as possible, and to prevent discoloring by exposure to the air before cooking, place directly into a dish of cold water. Have ready a sirup made of water and loaf sugar boiled to a proper consistency, place the apples in this when it does not readily run from a spoon and simmer gently for about ten minutes. Take out carefully into a jar which can be afterwards corked, or closely covered, boil the sirup a few minutes longer and pour over the fruit. In this way a choice fresh preserve is made, at a season when many housekeepers are getting short. It is a great pity that apples have been so scarce in many localities this winter, as I have no doubt they contribute largely to health keeping, which is better than health getting. As a mild and a pleasant cure for an ordinary sore throat baked apples eaten hot, are a remedy we have often found efficacious. The RURAL and other horticultural journals that aid us in selecting and planting orchards, by their advice and experience, are doing a work for the future health of our children, greater than all that can be accomplished by our medical men, for keeping the blood pure, and wholesome is one of the great secrets of health, and this the apple eaten freely will aid to accomplish.

DOMESTIC RECIPES.

Soups.—Beef Soup.

Crack the bone of a shin of beef and put on to boil in as many quarts of cold water as there are pounds of meat; add a teaspoonful of salt for each quart; simmer slowly, at first, skimming as often as any scum arises; let boil two hours, then add four large onions sliced; two carrots, scraped and sliced; one root of celery cut into small pieces—or a teaspoonful of celery salt. When the vegetables and meat are done, strain the soup and return to the kettle, adding a tablespoonful of rice for each quart, and boil until tender; add pepper and salt to taste. If the soup is preferred clear, omit the rice and thicken with a very little flour and water. A shin of veal is nice for soup but it should be soaked in cold water an hour before using.

Corn Soup.

Take twelve ears of sweet corn; cut the corn from the cobs and boil the cobs in two quarts of water until the sweetness is extracted; take out the cobs, add the corn and boil from twenty to thirty minutes; then add butter the size of an egg; pepper and salt to taste; one quart of sweet milk; let come to a boil and serve.

Vegetable Oyster or Salsify Soup.

Scrape and slice very thin a quantity of the salsify; boil in water sufficient to cover well until tender, adding one-half teacupful of finely picked-up codfish (which is to boil as long as the salsify) to about four quarts of the soup when it is done; when tender add butter, pepper, and milk to taste, with three or four rolled crackers, adding the salt when ready to serve. This method of cooking salsify gives to it the flavor of the real oyster.

Soups are not as common as they ought to be in private families. I believe that a dish of good nutritious soup—not grease—to warm and tone up the stomach before taking into it the more hearty and solid food, is a great aid to digestion, and that the health of our families would be increased were we to eat it at least once a day. MRS. MARY OLIN.

Yates Co., N. Y.

Bread Pudding.

Take any pieces of dry bread; cut into small bits and pour over sufficient boiling milk to soak it; beat smooth with a fork; sweeten to taste; add a little nutmeg; the peel of a lemon grated and half a pound of raisins; then add three well beaten eggs and bake about one hour and a half.

Date Pudding.

Remove the stones from one-half pound of dates and chop; add five ounces of chopped suet; six ounces of sugar; a little nutmeg, salt and two beaten eggs. Mix well together and boil in a basin or form four hours.

Apple Batter Pudding.

Peel and take out the cores from six good sized apples, fill with sugar; but into a pie dish and cover with a light batter. Bake one hour in a moderate oven.

Boiled Rhubarb Pudding.

Line a buttered basin with a good suet crust; cut rhubarb into small bits and fill the basin with alternate layers of rhubarb and moist sugar; cover with crust; pinch the edges together and tie over it a floured cloth; put into a kettle of boiling water and boil from two hours to two hours and one-half. MRS. M. M.

Owego.

QUERIES ANSWERED.

Is there anything which will prevent the formation of a crust in tea-kettles? IRENE.

ANS.—Yes, keep an oyster-shell in your tea-kettle.

My hands so perspire in summer that I find it ruinous to wear kid gloves. Is there anything I can rub upon my hands which will absorb the moisture? MRS. W. Z.

ANS.—The simplest as well as the most efficient remedy I know of for excessive perspiration is cornstarch. Rub dry upon the hands before drawing on the gloves.

MRS. M. G.—Try poulticing your stye with bread and milk or a poultice of linseed meal. In the beginning a stye may be checked by a free application of spirits of camphor.

YOUNG HOUSEWIFE.—Your childs' ear-ache may be relieved by mixing equal quantities of chloroform and laudanum and applying upon cotton to the ear. Sometimes a small quantity of ground pepper tied up in a little cotton, then dipped into sweet-oil and inserted in the ear is beneficial.

Correction.

IN the recipe for Sponge Cake, contributed by "Farmer's Wife," "dissolved in cream-of-tartar" should have read "dissolved in water."

E. M.

News of the Week.

NEWS OF THE WEEK.

AT home they have had a million dollar fire in Philadelphia. Senator Howe of Wisconsin made a bitter attack on President Hayes' Southern policy, on Civil Service Reform, the Cabinet in general, but especially on Secretary Schurz. This seems to be the first of a series of aggressive movements projected by Republican Senators against the Administration. Five Molly Maguires were hung this week in Pa. The new tariff bill before the House has gained the first victory—it tends toward freer trade. Judgement has been given against Mr. Tilden in the matter of his default to pay full income tax during the war and for some years afterwards. This merely settles the legal points; a jury will have to decide the amount: probably $150,000. Smyth, Superintendent of the Insurance Department in this State, who has been impeached before the Senate for culpable carelessness, if not worse, has been acquitted. Much grumbling among the "Simon Pures" who believe him guilty. There seems a suicidal mania throughout the country among farmers. Half-a-dozen have "stepped down and out" in the last few days. There is a large increase in the acreage under wheat all over the West, and the reports from that section are highly promising. A bill has been introduced and favorably received in the Legislature to compel liquor dealers in this State to use the Moffet bell-punch to register the drinks taken, paying a tax of 2½ cents on each drink. By no means a bad idea! Another Savings Bank in this city, has got into difficulty through the culpable mismanagement of its directors. The Republican Senators held a secret caucus on Friday to concoct measures against the Administration.

That war cloud across the Atlantic is gathering terrors as the days go by, and is likely soon to burst over the continent, scattering ruin and disaster. Negotiations are still in progress, but Russia and Great Britain have assumed positions which cannot be reconciled and from which neither can with honor well recede. Russia lays all the blame on England's captiousness, declares she is at Constantinople and may decide to stick there, and has been straining every nerve to induce the other continental Powers either to side with her or remain benevolently neutral in her struggle with the restive islanders. Europe, however, seems coming round to the English view of the consequences of the late treaty, to see that a Slav principality extending to the Ægean amounts, not to Russian preponderance, but to Russian rule in Turkey. Austria has declined to listen to the sweet voice of Ignatieff, who has just returned to St. Petersburg unsuccessful, while an Austrian army of 400,000 men are being rapidly mobilized, according to latest reports, and will soon be ready to move into Servia, Herzegovina and Bosnia, so menacing the Russian line of communications. An Anglo-Austrian alliance is not improbable, as England wants Austrian help, and Austria wants England's gold. War would be highly popular in Hungary. England proposes to land an expeditionary force in Greece, and has already landed a vast amount of stores and ammunition at Tenedos. The English reserves have been called out, on which Lord Derby, who is strongly opposed to war, resigned from the Cabinet. England expects 100,000 troops from Canada, and our friends across the border expect to recruit at least half of these from the States. It is said Russia is about to insist that the British fleet shall quit the sea of Marmora, England will peremptorily refuse, the Russians will enter Constantinople with the passive acquiesence of the Turks, and war will be at once declared. The Emperor of Russia is reported to be about to start for the army; so to be among his troops on the outbreak of hostilities. Germany will remain as looker-on without approving Russia's policy—watchful of France, which is engrossed apparently with the approaching World's Fair to be opened next month in Paris. There have been terrible wind, rain and snow storms in England. The Eurydice, Her majesty's training Brig, was upset while under full sail by a sudden squal near the Isle of Wight, and 300 men and boys lost, two only escaping. There is every indication that a more friendly feeling is growing up between Italy and the new Pope. Gen. Grant paid him a visit on Friday, was introduced by Cardinal McClosky and very graciously received. The Pope's friendly letter to the German Emperor has been answered in a like spirit and there is a prospect of speedy settlement of difficulties. The Roman Catholic hierarchy has been re-established in Scotland after an interval of nearly 300 years. Osman Pasha has been publicly thanked by the Sultan for his heroic defence of Plevna, and appointed Commander-in-chief of the Turkish forces. Roumania will not cede Bessarabia to Russia unless forced to do so, and in this she is said to be supported by Bismarck.

VARIOUS.

In the Maryland Farmer, Southern Agriculturists have an able journal devoting a large space to their exclusive interests. It is a monthly, printed on good paper with clear type, and always replete with timely topics. A sample copy will give one a clear idea of the scope of the Farmer, and we recommend interested readers to send for one.

During the recent famine in India not less than two millions of people died of actual starvation. The amount spent by the Government in relief work and in camp charity was about $30,000,000, and the contributions, chiefly from England and Australia, amounted to $2,500,000. The famine is considered at an end, as the new crops are coming in, and are safe from damage.

A Silesian farmer has adopted a method of imparting to butter an aroma as delicate as that secured from cows pastured in the most fragrant meadows. He suspends in the empty churn a calico bag filled with fragrant herbs, keeping the churn carefully closed. When churning, he substitutes four smaller bags, attaching them to the beaters of the churn. The result is thus secured in a perfectly legitimate and harmless manner.

The English sparrow is voted a nuisance all over the country. He drives away the birds that used to keep down noxious insects, banishes songsters, like the bluebird and robin, eats the buds of fruit trees, devours the young grain, and hasn't a single redeeming virtue. New England ornithologists propose a war of extermination against the trouble some bird-immigrant.

California is cheerful over the benefits which will result from the late flood. The Colusi Sun says it is estimated that 10,000 acres of land heretofore comparatively unproductive have been covered from six inches to two feet with a rich alluvial deposit. The "hard pan" covered with this sediment makes the very best grain land.

Gen. Robert Toombs says that tea-growing in Georgia is not a new thing—that for the last forty years "tea-trees" have been grown there. They were planted by Dr. L'Acce, who failed in his tea culture only because he did not understand the treatment of the leaves. The General holds that when Americans understand the manipulation of the leaves as well as the Chinese do, the former will produce as good as, if not better tea than do the latter.

A London correspondent of the New York Times writes that he has been assured by a journalist who ought to know that Mr. Stanley has really declared his readiness to undertake the discovery of the North Pole. If he has, says the correspondent, there will be an end of that old secret, if the problem is within the compass of mortal man to unravel it; for Stanley is as patient and persevering as he is resolute and courageous.

The number of people now pouring into the State of Kansas is without parallel in the history of the West. Twenty-seven car-loads of passengers came in one day from Atchison and Kansas City, on the Sante Fe road, mostly for settlement in the Arkansas Valley; besides these, large numbers came in on the Kansas Pacific road. It is estimated that the State will receive 200,000 additional to its population this year.

The prairie grouse is gradually following the progress of the railroads from the Nebraska prairies westward. California's effort to introduce and acclimate them has failed.

John Bright said in a recent speech at Rochdale, England, that one-third of the whole land of the United Kingdom, being no less than 23,000,000 acres, belongs to 935 men.

CORINTH, Maine, Feb. 12, 1878.

TO THE DAVIS SEWING MACHINE CO., Watertown, N. Y.—*Gents:* We are manufacturers of clothing; have been engaged in the business for the past fifteen years, manufacturing largely for Miner, Beal & Hackett, Isaac Fenno & Co., A. Sherman & Co., Smith, Richardson & Bates, Prager, Bock & Co. and Leland, Rice & Co., all of Boston. We have used the Davis Vertical Feed Sewing Machine for the past four years in manufacturing our clothing, and we know that it is better adapted to our business, and possesses superior advantages over any of the under-feed sewing machines.

Within the last three months we have had occasion to seam our clothing with double thread, and we find that the Davis Vertical Feed Sewing Machine (and no other family sewing machine) will do the work as well and easily as with the single thread. Yours, truly, T. BRACKETT & SON.

Reliable help for weak and nervous sufferers. Chronic, painful and prostrating diseases cured without medicine. Pulvermacher's Electric Belts the grand desideratum. Avoid imitations. Book and Journal, with particulars, mailed free. Address PULVERMACHER GALVANIC CO., Cincinnati, Ohio.

THE MARKETS.

PRODUCE AND PROVISIONS.

NEW YORK, Saturday, March 30, 1878.

BEANS AND PEAS.—Beans of all kinds continue weak and there is no demand that will stimulate prices. Receipts are heavily ahead of wants of consumption. Marrows show an important decline and exhibit the singular feature of being cheaper than mediums. Green peas are dull and lower $1.12½@1.15. Canadian peas nominal Southern B. E. peas $2.80@3 per two-bushel bag a light stock rate.

We quote:—Beans, medium choice, $1.50@1.55; other, $1.40@1.45; marrows, choice, $1.50@1.55; other, $1.50@1.55; pea, $1.50@1.65. White kidney, choice, $1.40@1.55; other, $1.55@1.95; red, choice, $2.10@2.30; other, $2.35@2.40. Turtle soup beans, $1.75. Lima, $3.

BEESWAX has a better trade and is stronger. Western and Southern quoted at 28@29c.

BROOM CORN.—Is slow and unsettled.

Green brush at 6@7½c.; green hurl, 5@6½c.; medium green, 4@5½c.; red-tipped, 4@5c., and common red, 3@3½c.

BUTTER.—Old State butter is struggling out of market where grade has any table recommendation and the price makes a retail profit certain. Every advancing day increases the independence of local buyers as new arrives freely and good enough to satisfy much of the upper trade; in fact a number have relinquished the search for fancy old. Common old drugs will be subject to chance sales until the close. Owners losses will be heavy in the crop of '77. Receivers are giving their annual growl at the wonderful yellow with which some shippers spoil stock. There are numerous inquiries as to best artificial methods of imparting June tint to hay and early butter. Here is a short one, don't attempt it. White butter should be allowed to stand upon its merits and about all that can be done is to give it selling table merit; this means extra care at the dairy, but it also means "a market."

OIL.—State dairies, good to choice 25@—c.; fair, 18@22c.; from 15@18c; selected firkins 24@25c; fair to good 18@23c; poor 14@16c; selected half tub 28@30c; other, 26 28c.; choice Fall Welsh 27@28c. Fair to prime 20@26c.; Welsh dairies, 24@26c. State creamery, 23@30c; other, 26@28c.; other 19@20c; Western factory, fresh, low goods worth 19@20c.; greese 6½@7c.

NEW.—State, half tubs, choice, 28@32; good 29@31. Welch first, 27@31; second, 27@30c; poor new, 23@26c: Western creamery ranges at 35@35c.

Exports past week, 8,547 pkgs.

CHEESE.—Exports for the week 18,450 boxes. The market has commenced to drop on other than fancy lots, on account of tame English advices. Really choice stock is scarce and one parcel has sold as high as 13½, with 13 the outside price for average fancy lots, prices are:

Fancy factories, 12¾—c.; good and prime, 10½@11¾c.; fair lots, 9@10½c.; poor, 10@10½c.; 7@10c., skimmed. Farm dairy, 11¾@12¾c. for good to prime; 10@12c. for fair lots; 7@9c. for skimmed; Western factory, cheddar, 10½@11¾c. for fine; 11½@12c¾. for good; 6@9c. for poor.

Liverpool cable, 67s. Gold closes 101¼.

Exports for the week, 14,533 boxes.

LITTLE FALLS.—Offerings of choice light, a few shipped on commission. Farm dairy quoted 10½@11c. Sales of butter light, quality improving; average price 27c. with light demand.

COTTON.—The English news has depressed the market and closing weak.

Latest prices are for March, 10.62@10.63c.; April 10 68@10.69c.; May, 11.17@10.76c.; June, 11.0@10.86c; July, 10.95@10.96c.; August, 11.01@11.02c.; September, 10.81@10.83c.; October, 10.65@10.66c.; November, 10.57@10.78c.; December, 10.60c.

Quotations for poor cotton are based on American standard of classification, and on cotton in store running in quality not more than half a grade above or below the grade quoted.

	Uplands.	*Ala.*	*Orleans.*	*Texas.*
Ordinary	8 1-16	8 1-16	8 3-16	8 3-16
Strict ordinary	8 13-16	8 13-16	8 15-16	8 15-16
Good ordinary	9¼	9¼	9⅜	9⅜
Strict good do	9⅜	9⅜	9⅜	9⅜
Low middling	10 3-16	10 3-16	10 5-16	10 5-16
Strict low middling	10 9-16	10 9-16	10 11-16	10 11-16
Middling	10¾	10¾	11	11
Good middling	11⅛	11⅛	11⅜	11⅜
Strict good middling	11 9-16	11 9-16	11 11-16	11 11-16
Middling fair	12 1-16	12 1-16	12 3-16	12 3-16
Fair	12 9-16	12 9-16	12 11-16	12 11-16

Stained.

Good ordinary, 8⅛c. Strict ordinary, 8⅜c.; Low middling, 9⅜c.; Middling, 10c.

DRIED FRUITS.—There has been a very dull feeling throughout but prices fairly steady.

Apples—State quarters, old, 5¾@6c.; new, 5¾@6c.; Western quarters, old, 5@5¾c.; new, 5½@5¾c.; Southern, new, prime sliced, 7c.; fair to good, 4½@5c. Peaches—Peeled, new, 9@10c.; unpeeled halves, 4¾ 5c.; unpeeled quarters, 3¾@4c. Pitted cherries, 15@16c. Blackberries, 9@10c. Raspberries, 26c. Plums, 15c. and Southern at 12c.

EGGS.—Receipts for the week, 2,289 bbls. do. last week 21,115. The market is fairly active and it should be at the prices, but receipts are so heavy that dealers despair of seeing rates down to a point that will permit even the paying temporary advances, that they are accustomed to in Lent. Western are of fine quality and some speculation exists. Southern run small and are not packed as attractively as others, hence the under rate.

Near points, 11½@12c.; State, 10@10½c.; Western, prime, 10c.; Southern do., 9½c.; off quality stock, 9c.; Duck, 18@20c.; Goose, 38@40.

FLOUR.—There has been an advance of 25 to 50 per cent. on the upward turn in wheat values, through the warlike look of affairs abroad, and an active inquiry.

Latest prices are $4.25@4.30 for poor to fancy superfine State; $4.90@5.25 for common to fair extra do; $5,00@5.25 $5.25@5.65 for good to choice do.; $4.65@4.90 for superfine, Indiana, Iowa, Michigan, Ohio, &c.; $4.85@5.25 for very poor to good shipping extra do do., (chiefly at $5.00@5.25) and $5.25@5.75 for good to choice extra do.; common to choice white extras, $5.50@6.65; fancy do at $6.40@7.50; (the latter an extreme); red and amber winter wheat, inferior to choice trade and family, at $5.20@5.35; round hoop Ohio at $5 00@5 35, and trade brands of at do. $5.50@6.75, the latter for choice; St. Louis, $5.40@6.00 for poor to fair extra and $6.00@7.75 for good to fancy; (with a few brands of very fancy quality quoted up to $7.25@7.50); Minnesota clear, $5.00@6.15; Minnesota "straight," common to fancy, at $5 50@6.75 and patent poor to very choice, $6.00@8.25, with a few fancy at $8.75@8.50; unsound stock at $2.25@5.75; city mill extra at $5 90@6.30 for fair to very choice for West Indies; do, for England $4.85@5.25; do, trade and family extras, $6.50@7.50; do, South America, $6.40@7.35 for fair to fancy; No. 2 at $2 75@3.40.

Corn meal is selling at $3.15@3.20 for Brandywine and $2.75 for yellow Western.

FRESH FRUITS.—Exports of apples 415 bbls. Choice apples have advanced but there are few holders of lots that command the extreme. The best round sale of the week was 300 pounds best stored at $8. Similiar stock now quoted $5.50; good Russets $4@4.50; crimson or wasty lots 2.50@3. Cranberries weaker with the advanced date but with the diminished stock of apples and their evidently settled high prices, a steady call from bakers here and outsides will close up the remnant of berries satisfactorily. Strawberries regularly and are lower. Peanuts are moving at full prices, but the market is not busy enough to warrant a proposed advance. Fancy hand-picked Va. $1.35@1.40, common to good 85c.@$1.25, Pecans, Texas, 8@10 llb.; Hickory nuts $1.00 per bush.

FURS AND SKINS.—There is some little revision of prices following the London sales now closed: but the trade is very dull.

	No. 1 quality. Nor. & East.	West & N. W.
Otter, ₱ piece	$3 00@ 4 00	$2 00@ 2 50
Gray Fox	40@ 45	40@ 45

Muskrat, winter	8@ 10	6@ 8
fall	6@ 7	4@ 5
Kitts	@ 2	@ 2
Beaver, ₱ ℔	1 00@ 1 25	60@ 75
Raccoon	35@ 45	35@ 45
Opossum	3@ 6	3@ 6
Skunk, black		50@ 60
striped		7@ 30
Wolf, mountain		1 50@ 2 00
prairie		50@ 60

Southern raw skins are worth 20 per cent less than Western.

GRAIN.—The probabilities of an early adjustment of the difficulty abroad, the early opening of navigation, and larger supplies looked for soon weakens prices.

Latest sales are of No. 2 old at 60c—ungraded red and amber State, $1 30@—; white, $1 40; No 1 Northwest spring, $1 27; No. 3 Chicago, $1 21½; No. 2 red for March at $1 23; No. 2 Milwaukee spring, $1 27. Rye has been very active, purchases within a week reaching fully 250,000 bush. largely for the German markets, closing at 73c. for Western: 76@77½c. for State and 76c. for Canada. Corn is weak and quiet. Latest sales are of New York No. 2 at 54@55½c.; steamer mixed, March, 51c. Oats of New York extra white, at 31½@40c.; do. No. 1, March 31½c.; No. 2 white, 35½c.; mixed Western, 31@34½c.; white Western, 36@39c.

All articles have been affected by the situation abroad, and with an active inquiry from exporters prices are much higher: latest sales of wheat are of ungraded spring at $1.20@1.25; bush. No. 3 spring at $1.22@1.23½, No. 2 northwest spring at $1.28@1.29; New York No. 2. spring at $1.27@1.27½; Chicago spring at $1.29; No. 2 Milwaukee spring at $1.29@1.30; No. 1 Milwaukee and Minnesota spring at $1.34@1.35; ungraded red $1.35@1 36; No. 1 red at 1.38; No. 1 white at $1.42, white State, a $1.46@1.47; No 2 red, March delivery, at $1.37; No 2 red, April delivery, at $1.36½@1.37; New York No 2 spring, March delivery, at $1.28½@1.29; do., April delivery, at $1.26½@2.27; do., April delivery (in store), at $1.27; No. 2 northwest spring, March delivery at $1.30; Rye at 78@79 for State, and 73 for Great Western.

HAY AND STRAW.—The arrivals are larger, but demand is rair and prices sustained.

Bale hay, 60@65c. for shipping, and 75@85c. for retail qualities; clover, 40@50c. for prime. Straw, 45@55c. for long rye; 45@50c. for short rye, and 40@45c. for oat.

Exports since Jan. 1st, 17,250 bales; same time last year, 14,850 do.

HONEY.—There are no late sales except for show and druggists use. It looks as though much comb will be crrried over.

HOPS.—There has been more doing for export strictly fancy lots, which are scarce would probably bring something above quotations but otherwise buyers have the advantage.

State choice to fancy, 11@12c.; good to prime, 8@10c.; do., low and fair, 5@7c.; Eastern, new, 5@8c.; Wisconsin, do, 5@8c.; Yearlings, 2@3c.; Olds, all growths, 1@2c.; Californians, 12@14c.

MAPLE SUGAR.—The demand does not keep pace with the free supply and the low rates of 8@11c. are full; few parcels bring the extreme. Sirup, 75c.@$1 ₱ gal., with can.

OIL-CAKE.—Western is quoted at $30 ₱ ton.

POULTRY AND GAME.—Live arrives in excess of use, though city killers have generally begun operations. Prices are weak and with large arrivals due sellers are taking inside rates.

N. J. chickens, 10@13c.; W. fowls, 11@13c.; Turkeys, @13c.; Toms, 6@8c.; Ducks, N. J., pair, 87@$1.12; Geese, N. J., $1.75@2.00; Western, $1.12@1.50.

Dressed poultry is in fair supply though city and country killed. Prices have fallen during the last week. Shippers should now send only light hen turkeys.

Fancy Phila. and N. J. turkeys, 16@18c.; good, 8@6c.; large or Toms, 7@9c.; chickens, choice, 8@9c; good, 11@13c.; common, 6@7c.; ducks, choice, 15@20c.; other, 21@23c. small and slips, 18@19c.

Game is scarce but the demand is moderate.

Hares and rabbits, pair, 20@25c. Canvas-back ducks, $1.25@1.75; Red-heads, $1.00; Mallard, 35@40c.; Teal, 25@40c.; Quail, prime, $2.75@3.00; soft, $2.25@2.50. Partridges, pair, 75c.@$1.00. Grouse, $1.00@1.50; poor, 90c.@$1.10.

PROVISIONS.—Are generally higher and active.

Mess pork, $10½@10.¾ for spot lots; $9.90 @ 10 for March and April. Bacon at 5¼c. for long clear and 5¾c. for short clear. Lard—Western steam, 7 37½c. 7.40c. for short, 7.44@7.46c. for May, 7.54 755; Tallow at 7 3-16c. for prime. Stearine, 7¾c. for prime Western. Beef hams at $15.50. Beef—New extra mess, $12.@12.25; plain, $10.50@11.50; new packet, $15. family mess, $17.50; extra India mess, $27 for city brands; do. Philadelphia, $25. Beef hams at $15@15.50; Tallow at 7½ for prime

SEED.—Grass are weak. Clover, 7@7½c. for Western; 7¼@7½c. for State. Timothy, $1.40. Rough flax, $1.45.

TOBACCO. — The new crop comes in more freely, and export demand is better.

KENTUCKY LEAF.

	Light.	Heavy.

wrappers	20 @50
New York assorted lots, common to medium	8 @ 9
Good	10 @12
Ohio assorted lots	7½@10
Wisconsin assorted lots	7½@ 9

VEGETABLES.—There is a weak feeling in potatoes, holders fear sprouting and good qualities are offered low.

We quote Peach Blows $1.50@1.75, bulk and doubleheads. Early Rose, $1.00@1.25; Peerless, $1.25@1.50; Nova Scotia, $1.90@2.00; Sweet, $2.25@2.50. Cabbages, 100, $3.00@4.00; red, 5@6. Marrow squash, bbl., $1.50@2; Hubbard do., $2.00@2.50. Russia turnips, 75@87c. Carrots, 75@87c. Beets, bbl., 62@75c. Red and yellow onions, $1.00@1.25; white, $1.25@1.75. Celery, doz., 75c.@$1. Hot-house mushrooms, ₱ ℔, 40@50c. Radishes, 100 bunches, $4@4.50. Lettuce, small, dozen, 75c.; large, $1@$1.50. Cucumbers, doz., $2.25@2.75. Rhubarb, doz., $7@8. Spinach, Southern, @2.2a ₱ bbl. Bermuda, $4.50@5.

WOOL.—There has been but little demand from manufacturers, and the advancing season exerts rather a pressure to sell, with slightly easier prices. There is a desire to urge business a little by making concessions.

Ohio, Pennsylvania and Virginia—XXX and picklock, 44@46c.; XX, 42@44c.; X, 42@43c.; No. 1, 43@44c. No. 2, 35@37c.; common, 33@35c.; combing, 52@55c.

New York, Michigan, Indiana and Wisconsin—XX, 36@38c.; X, 36@38c.; No. 1, 38@42c.; No. 2, 38@36; common, 32@34c.; combing, 46@50c.

Iowa, Vermont and Illinois—X and XX, 35@37c.; No. 1, 37@40c.; No. 2, 32@34c.; combing, 45@50c.

Missouri, Kentucky, and Tennessee—Washed fleece, 37@42c.; unwashed, 25@30c.; unwashed combing, 36@38c.

LIVE STOCK MARKETS.

NEW YORK, April 1, 1878.

BEEVES.—Receipts for the week, 10 748 head: do., last week, 6,563 do. Quality continues good; and the fact is quite encouraging after the alarming reports that indicated a glut of common droves in the country. The market showed some of the lull that is likely to occur in Lent and last week's prices were not repeated. Best 16.00@1100 llb.; steers were well sold at 10¾c. and some very prime stock were at 10¾c.; medium to good steers quoted pretty regularly at 9@10c. very common car-loads and fair grade 7¾@7¾c. Estimates paid 9¾@10c; at bulls, $3.25@3.24 per 100 lbs.

COWS AND CALVES.—The receipts include but few prime milkers; occasionally a nice fresh cow with calf by her side brings $70. Others range from $40 to $65, the lower rate for rough badly wintered stock.

VEAL CALVES.—There has been a fair business, but stock to bring 8c. had to be very extra; good general prices are 5¾@7½c. for common to prime to live. Young but passable calves a slight grade above, bulls hold at $2.50@4.00 per head. Hog dressed calves 5¼@9c.

SWINE.—Receipts for the week, 17,405 head: do. last week, 35,340 do. A named price at the close was 4¼@4¼c. Market dull and unsettled. Country pork, 4¾@5¾c. for heavy to light State and New Jersey. Good Ohio selling at the close at $4 per 100.

SHEEP AND LAMBS.—Receipts for the week, 17,377 head: do., last week, 16,459 do. The demand at the close was light; heavy course sheep were an objectionable feature, but the light opening made some competition among butchers. Poor N. Y. sheep ruled at $9; clipped Kentucky sheep 95 lb. average had a bid of 43½c.; Ohio, Indiana and Pennsylvania sheep sold at a range of $6.88@7 per 100 lbs.; lambs $4@7. per head; the the extreme per good weighty ones.

Reading for the Young.

A NAMELESS LAMB.

O. C. JR.

Oh, mama, such a dashing lamb
As we have seen to-day,
We met him coming from the woods
As we went out to play.

We knew that he was some one's pet,
Because he was so tame,
He frisked about, then came up close,
But could not speak his name.

We called him Nannie, Tom, and Jack,
And lots and lots of more,
But he shook his head, just so, mama,
And capered on before.

Yes, on he ran, then turned around,
With such a comic look,
And mama, you would laughing die,
To see him jump the brook.

He stood upon his two hind feet
And give a big, big jump,
And down he came on t'other side
All in a little lump.

We was so 'fraid he kill his self
We didn't know what to do,
But up he got, and looked to see
If we could jump it too.

But we went up a little way,
To walk the plank, you see,
Where papa said if we look sharp
We would find a beechnut tree.

Well! we found the tree, where papa said,
But lost our little pet,
But found him way, way down the brook
His frizzy back all wet.

And when we told him he must stay,
And not go out the wood,
He shook his head and wagged his tail,
And I guess he understood.

For he went and lay down on the grass,
All curled up in a heap,
And if we had not woke him up,
He would lay there yet asleep.

But we holler'd, Nannie, Tom and Jack,
Why do you sleep all day,'
When little girls come 'way out here
To have a jolly play.

Then up he jumped, and ran around,
And jumped, and jumped so high,
Oh dear! I know our fuzzy cat
Was never half so spry.

A MEMORIAL.

BERTIE A. WINKLER.

It was a bright spring morning. The sun had just emerged from behind the drapery of forests, and was dipping his golden beams into the dew-filled petals of early flowers when HARPER ARGOW slowly limped along the village road returning the cheery salutions of passing neighbors with a pleasant smile and a faint "good-morning."

HARPER ARGOW was lame, but in spite of that he was the pride of the village; the boy to whom every father pointed as a model for his sons; the boy whom every other boy claimed for his comrade; the boy who was always called upon to arbitrate in every quarrel. He was on his way to the play-ground to which his comrades had invited him after a whole week of conclaves and mysterious gatherings from which he, their leader, was, for the first time excluded.

Arrived on the grounds where upwards of thirty boys had gathered he said, with a faint touch of reproach in his voice, "Well, what are you up to now, so early? Some mischief, I guess or else you would not have kept your secret from me so long."

"Wrong, HARPER, wrong!" they replied with merry twinkles in their mischievous eyes," we got you out so early because we wanted to enjoy your surprise undisturbed by any passers-by. Here," said ASHLEY GREY, producing a handsome new crutch from behind the nearest tree, "I present you this in the name of your comrades as a memorial of your heroic deed this day two years ago." Then turning quickly to the rest he whispered, "Boys, I've seen tears in his eyes, let's give him three good cheers while he masters himself."

"Hurrah! hurrah! hurrah! for HARPER ARGOW," rang through the clear sky while HARPER looked through the mist before his eyes first at his new crutch, then at his old one, then again at his comrades whose hats were tossed in all directions in an excess of delight at the happy issue of their plans, drowning his words of thanks in the united exclamation of "All right ARGOW, we'll do more than that for you, we'll vote for you for Governor some day."

While they are enjoying the surprise of their comrade who is comparing the merits and beauty of his new wooden walking-companion with his old one we will relate the events of that same day two years ago when HARPER was fourteen years old.

ASHLEY GREY and HARPER ARGOW were on their way to the mill with four bags of wheat on their light spring wagon. About four miles from home they heard a loud crash in the neighboring wood and a man's cry of alarm. Hastily jumping from the wagon to ascertain the cause of the noise they discovered MAX ROBERTS, nick-named by the village-boys as the Mexican Robber, ever since he chased them with a cow-hide for playing base-ball in one of his fields, lying in a helpless, bleeding condition beneath a huge tree which had fallen across the rail road track. ASHLEY was about to harangue his unfortunate enemy about his cow-hiding but HARPER, silencing him with one sharp word of reproof, scrambled down the steep banks and placed his ear close to the man's lips who, after telling him that in endeavoring to fell the tree the rope, which was to pull the falling tree from the direction of the track broke, and the branches catching his garments, pulled him along as it fell into the track.

HARPER realized the terrible situation at a glance and calling to his companion to aid him they took long poles and drove one after the other as a wedge between the track and the tree until it was sufficiently raised to relieve the man from the pressure which had broken his arm.

"Now, ASHLEY," he said, to his frightened companion, while the perspiration stood in large drops on his forehead, "we are not strong enough to take him away, but you run to the nearest neighbors and get them to do it, and if possible to build a fire on the track in case I should not be in time to stop the train at the station."

"Hurry, ASHLEY, for your life," he cried, after the fast vanishing form: "the train is due in twenty minutes!" Then rushing to the wagon and unhitching the horse, he swung himself on his back.

For a moment he paused to consider: "I have no matches to build a fire; nothing to give the signal of danger, I must go and risk it. In ten minutes the train will be at our village station, and I have four miles to ride in that time with an old horse. Now, Dolly, do your best," he muttered, as he lightly swung his whip and sped away to race with time. Past fences, and trees, he flew: hills, forests, and fields followed each other in quick succession. Cattle grazing in the meadows stared in mute, lazy astonishment at the flying rider; people in blank amazement hastily drew aside to let the escaped madman, as they thought, pass. But on, on, he sped, paying no heed to shouting, wondering people; thinking of nothing but the wounded, senseless man he had left, whose life depended on the speed of his horse, and the train full of passengers swiftly whirling towards destruction. Seeing nothing but his horses flying mane and frothy mouth, hearing nothing but the clattering hoofs and the short gasping breath of his almost exhausted steed.

There was a narrow foot-path leading through the forest which would cut off a considerable distance. Into that he directed his horse. Fortunately there was no underbrush, and by hugging Dolly's neck he could just escape the branches of the trees. At this moment the shrill whistle of the train nearing the station reached his ear. Three minutes more and he would be too late. Again the horse dashed forward while HARPER, clinging close to him, left shreds of his garments hanging on most every branch. At last he emerged from the woods; the village was in sight; he saw the puffs of steam from the waiting engine; a minute more and the train would start. Already his horse was nearly exhausted; he could not hold out much longer. Once more he gently urged him on and in another instant he dashed hatless, coatless, ragged and livid into full view of the station.

"All aboard," cries the conductor, another shrill whistle, and the wheels begin to move.

"Too late!" muttered HARPER, almost beside himself. He tried to shout but his voice failed him. His heart sank within him as he saw the train start. Suddenly he caught the eye of the switch-tender, who, seeing the desperate motion of the boy's arm towards the train, swung his red flag and rushed up to the engineer, pointing towards the wild horse and still wilder-looking rider.

The train stops, the conductor jumps off, passengers look from their windows just in time to see the horse flag, stumble, and fall over his rider in a trembling heap. HARPER is dragged with a bruised, broken leg from under the animal; he tells his story in a broken sentence: "tree across the track, four miles," and he fell back insensible.

The man, train, and passengers were saved, but HARPER ARGOW was a cripple for life.

This is the event which brought his comrades out so early, and to none of the boys does the recollection of that day come more vividly than to HARPER, as he, sadly smiling, looked again at his new crutch and said, "Well boys, it is better to lose one leg than a hundred lives."

COMMENTS.

A NEW comer is "Wild Goose," who at once fears the evil designs of "Slayerofconceit," and writes briefly. It does seem as though the Cousins should be able to find more inviting themes than personal criticism.

Our much injured Cousin, "Young Orator," sends me a long and somewhat spirited defence of himself against the strictures of the irrepressible "Slayerofconceit." I think the controversy had best end, as it would be a sorry spectacle indeed to see the Cousins engaged in a general wordy warfare. Let us have peace, and a pleasant time. "Young Orator" wishes to know how Andrew Jackson acquired the *sobriquet* "Old Hickory?" Most every Cousin should be able to answer this.

A new Cousin HATTIE P. H., writes her first letter, standing the while in mortal dread of that ogre the waste-basket. She is still quite young and regrets that school will close so soon. Now that Miss HATTIE finds she has escaped the capacious man that devours so many choice thoughts, she will no doubt venture again. Always welcome. And here is "Bob White," who has come from the Far West to say a word to Miss BERTHA WEEKS. "Bob" is the harbinger of Spring, but if he continues as he begins by the awful statement that the girls are very conceited, he may rely upon finding himself in water considerably above the boiling point. He gives the young ladies some practical advice about arranging their gowns, and yet he is only eight years old, and studies at home. He says, in effect, that he has the courage of his opinions and means to act the part of echo: he will always talk back! His flag is nailed to the mast-head, and the tail of his coat trails the ground. Now, look-out.

Here is some homely wholesome advice from Bonnie. She says:

"DEAR COUSINS:—I have been very much interested in reading your letters. And now I am going to write a letter too. It is my first attempt. If UNCLE TRUE does not wish to publish it, that will neither surprise, nor offend me. What prompted me to write, was, that I wanted to tell the Cousins I did not like so much sharp-shooting at each other. I think the letters should be more to instruct and amuse, and not to say things that will injure the feelings of any one. I would much like to have questions asked for information—such as History, Botany, Geography, or from anything that will help us to advance in knowledge. I am living on the wild prairies of Kansas, with but little society or means of amusement. We take the RURAL, and I cannot tell you with what eagerness and delight we hail its coming." Finally little Miss "Z." adds her protest against the exhibition of temper commented upon above, and I have no doubt that hereafter there will be an "era of good feeling" and an improved tone in the letters.

The Puzzler.

GEOGRAPHICAL CHARADES.

1. A PRONOUN, a girl's nickname, a verb, an interjection; whole forms a Southern river and valley.

2. A French preposition, a French article, merchandise; whole forms a State, bay and river.

3. A lover, to spoil, a verb; whole forms a town of Anglesea Island.

4. A school-boy's romp, a pronoun; whole, a river of Spain.

5. A French pronoun, a French preposition, to leave; whole forms a river of Portugal.

6. A vowel, scampered; whole forms a city of Africa.

7. An interjection, anger; whole, a river of France.

8. A cape of Corsica, to do wrong; whole forms a city of Zealand.

9. A boy's nickname, a vowel, a verb; whole, a river of Prussia.

10. A sailor, an article, a preposition; whole, a gulf of Italy.

11. A preposition, female fowls; whole, a city of Greece.

12. To stumble or fall, an article; whole, a range of mountains in Turkey.

13. An animal, a river of North Carolina, a vowel; whole, a city of Dalmatia.

14. The curse of nations, observed; whole, a city of Poland.

15. A river of Italy, a French article; whole forms a city of Austria.

16. Part of bedstead, a lady's name; whole forms a city of Austria.

17. Fighting between armies, just so, noise; whole, a city of Austria.

18. Part of the human body, a horse, a vowel; whole, a city of Italy.

19. Obtained, a sound of laughter; whole forms a city of Germany.

20. Kitchen utensils, an animal mother; whole forms a city of Prussia.

21. A young girl, a vowel; whole, a city of Prussia.

22. To twit, not off; whole, a city of New England.

23. A kind of cheese, earth; whole, a country of Europe.

☞ Answer in two weeks. LITTLE ONE.

MISCELLANEOUS ENIGMA.

I AM composed of 14 letters:
My 3, 5, 9, 11 a church official.
My 6, 2 a negation.
My 1, 4 a pronoun.
My 7, 2, 9, 13 keeps our spirits up.
My 1, 8, 14, 6 a cape or South America.
My 6, 10, 12, 13, 14 signifies not to be.
My whole should be our watchword.

☞ Answer in two weeks. BALTO.

PUZZLER ANSWERS.—March 23.

REVERSALS.—1, Ante, Etna; 2, Eel, Lee; 3, Dab, bad; 4, Tab, bat; 5. Moor, room; 6. Rood, door; 7. Dub, bud; 8. Tun, nut; 9. Not, ton; 10. Dam, mud; 11. Tub, but; 12. Cam, Mac; 13, nap, pay; 14. Draw, ward; 15, Gem, Meg; 16. On no; 17, Fi, if; 18. Og, go; 19. Sag, gas; 20, Tram, mart; 21. Trap, part; 22, Tap, Pat; 23, Top, pot.

ENIGMAS.—1, Because it has a knot in it. 2, Because he chisels and screws. 3, Because it is a cram. 4, Because it is composed of bars and a rest. 5, Because it is imperfect. 6, You would make pale ale. 7. It makes a lot plot; 8, He makes a revolution. 9. Because it is a capon. 10, Because it is composed of belles letters.

Sabbath Reading.

NO ROOM FOR JESUS.

O plodding life! crowded so full
Of earthly toil and care!
The body's daily need receives
The first and last concern, and leaves
No room for Jesus there!

O busy brain! by night and day
Working with patience rare,
Problems of wordly loss or gain,
Thinking till thought becomes a pain;
No room for Jesus there

O throbbing heart! so quick to feel
In others' woes a share,
Yet human loves each power enthrall,
And sordid treasures fill it all;
No room for Jesus there.

O sinful soul! thus to debase
The being God doth spare!
Blood-bought, thou art no more thine own;
Heart, brain, life, are his alone;
Lest soon the bitter day shall come
When vain will be thy prayer
To find in Jesus' heart a place;
Forever closed the door of grace,
Thou'lt gain no entrance there.

[*N. Y. Christian Advocate.*

ABRAHAM'S PRAYERS.

THE first full length prayer is Abraham's touching plea in behalf of Sodom (Gen. xviii. 22, 23), See in it the characteristics of acceptable prayers:—

A sinner feels he is "but dust and ashes," deserving "anger," not favor.

The sinner stands before God, believing in the promised Saviour—no other warrant.

The sinner full of faith, that is, resting wholly on Messiah, is "the friend of God." God meets him, and stays to hear what he has to say.

This believing sinner yearns over perishing souls.

He perseveringly urges requests in behalf of the perishing.

Then we find (xix. 27-29) he looked after his prayers, and found results.

Men of faith, oh be men of prayer! A world perishing. Our country needs it. The churches of Christ need it. The Jews need it. The heathen need it. Some at your very door need it. And surely there would be results.

THE MAZARINE.

THERE are only two copies of the Mazarine Bible in America and only six in the world. Two years ago two copies where sold at auction in London in the same sale, and one, printed upon paper, brought $14,000 gold; the other, on vellum, brought $20,000. Usually a vellum copy of any work brings four or five times as much as a paper one; but the history of the Mazarine Bible raises the value of the paper copies relatively to those on vellum. Guttenberg printed the first copies in 1455, and all these were on paper: in 1456 Faust got possession of the types and his edition was partly on vellum. These consequently, are not so complete or original. One of the American copies is owned in Hartford It is one of the genuine Guttenberg prints, and is a marvel of the printer's work. Its equal could not be made to-day.

FORMATION OF CHARACTER.

IF you ever watched an icicle as it formed, you would have noticed how it froze one drop at a time until it was a foot long or more. If the water was clean the icicle remained clear, and it sparkled brightly in the sun; but if the water was slightly muddy the icicle looked foul, and its beauty was spoiled. Just so our characters are formed. One little thought or feeling at a time adds its influence. If every thought be pure and right, the soul will be bright and lovely, and will sparkle with happiness; but if there be thoughts and feelings impure and wrong, the mind will be soiled, the character depraved and darkened, and there will be final deformity and wretchedness. How important then that we should be on our guard against every evil impulse and desire!

ROSE AND THORN.

I heard Philosophy sigh,
"No rose is without thorn;"
And faith made sweet reply,
"Of thorns are the roses born!"

Kimball.

INFLUENCE OF LITTLE THINGS.—Chemists tell us that a single grain of the substance called iodine will impart colour to seven thousand times its weight of water. It is so in higher things; one look, one habit, may affect the whole of life and character.

APELLES.—As Apelles the painter much lamented if he should escape but one day without drawing some picture or line: so ought a Christian man to be sorry if that any day should pass without some good work or exercise.

As soon as we are awake, our hearts should be in heaven. We owe God in the morning the first of our reason, before we think of other things; for every day is but the lesser circle of our lives.—*Dr. Manton*

PERSONAL ITEMS.

Under the patronage of King Humbert, an International Exhibition is to be held at Milan in 1879.

The rumored shooting at Plevna of the Communist Gen. Cluseret is denied. He lives, and has abandoned warfare for war correspondence.

Ex-Minister Washburne will go to the Hot Springs of Arkansas as soon as he has recovered sufficiently from his illness to make traveling possible.

A pious man has hired space in the Ellenville (N. Y.) Journal's advertising department, in which he publishes every week, in large type, a verse of Scripture.

Gen. Le Duc, Commissioner of Agriculture, has established an exchange with the Khedive of Egypt, giving young American trees for specimens of the date palm. The latter are to be planted in Colorado.

Emperor William is eighty-one. He looks exceedingly hale and hearty, although the fatigue of the Berlin season has been great. For a fortnight scarcely a day passed without his attending some ball or other entertainment.

The Chancellor of the Exchequer is, so to speak, principal schoolmaster of the British House of Commons, the length of holiday at Easter and Whitsuntide being entirely in his hands. Members are just as anxious for the recess as are boys at school.

Mr. J. B. Knight of the Franklin Institute, in Philadelphia, a scientific engineer, has made a thorough investigation of the Keely motor during a period of five months, and reports that it is a fraud, and that the various parts of its apparatus have been constructed with intent to deceive.

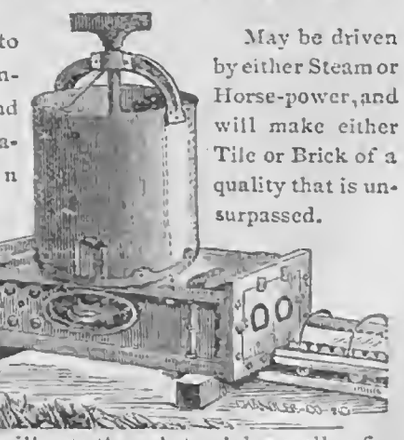
No good Farmer can afford to market dirty grain.
A medium quality well cleaned brings a better price than the nicest grade in dirty condition.
Address, A. P. DICKEY, Racine, Wis.

The Phœnix Drain Tile Machine



Is claimed to be the most simple, strong and durable machine now in the market.
May be driven by either Steam or Horse-power, and will make either Tile or Brick of a quality that is unsurpassed.
Purchasers will note the substantial as well as finished make of this machine; the easy accessibility of its working parts; the means of keeping its plunge-chamber to fit closely, without reference to age or wear; and its general suitability for making Tile at the lowest cost. SEND FOR CIRCULARS.
CHANDLER & TAYLOR, Indianapolis, Ind.

The THOMAS RAKE is made for farmers who want a first-class Rake at a comparatively low price. It costs less for repairs, does better work, and is more durable than any any other Rake. It is the standard everywhere. We also make a lower-priced Rake and the best Revolving Rake in the market. Send for Circular. Order from the Factory if your dealer does not keep them. Made by
J. H. THOMAS & SONS, Springfield, Ohio.

CIDER PRESSES AND GRATERS.
BOOMER & BOSCHERT PRESS CO., Syracuse, N. Y.

Wit and Humor.

THEY MET.

ROBERT TURNEY.

THEY met—'twas at the garden-gate;
The moon shone bright—the hour was late;
No prying eyes were round to see—
And he was there, and so was she.

They wandered through each well-known walk,
They talked the talk all lovers talk.
The moonbeams peeped through bush and tree—
And she was there, and so was he.

"Thou art my life, my soul," he cried;
"There lives not on this world so wide
An Angel without wings like thee"—
And he was there, and so was she.

And from her lips these accents fell:
"My love for thee words fail to tell;
'Tis boundless, dearest, as the sea"—
And she was there, and so was he.

Sweet moon, 'neath thy inspiring rays,
What pranks mysterious Cupid plays;
A *moonshine* little god is he—
And he was there, and so was she.

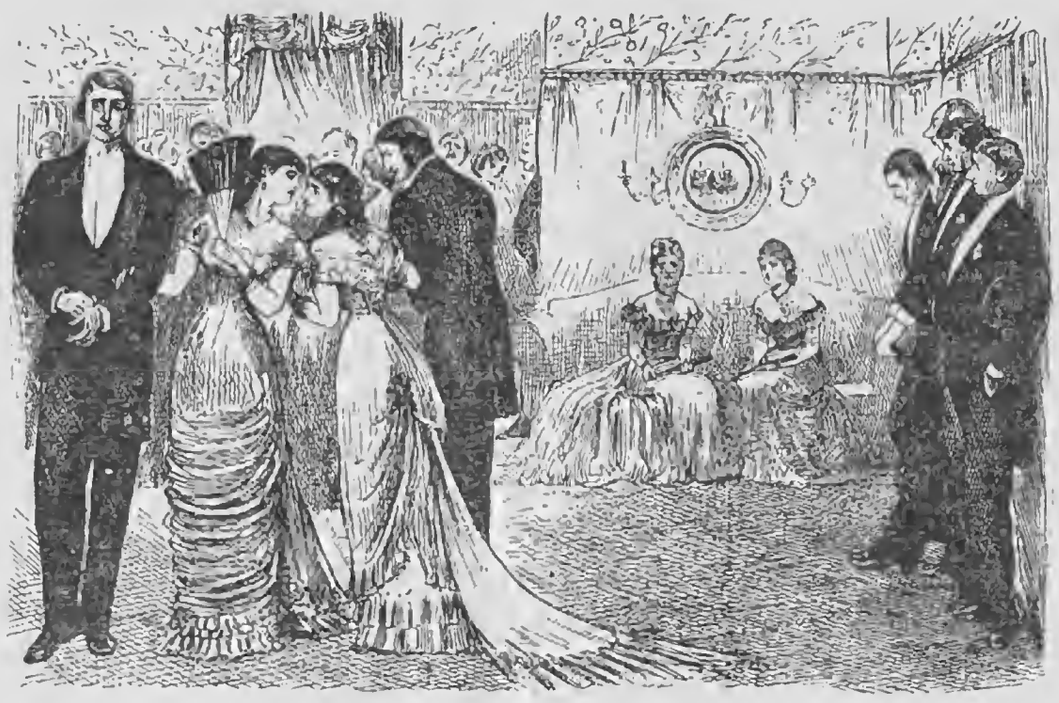
"Hector—good dog!" the old man said,
"You maudlin fool should be in bed.
My noble hound, I'll cut thee loose;
We'll cook you midnight-wanderer's goose."

"Adolphus, fly!" the maiden cried,
"Here Hector, with mouth open wide,
And eyes that glow like balls of fire,
Comes, followed by my wrathful sire."

He shook the dew-drops from his boots;
Like meteor through the air he scoots;
But Hector rushes like the wind,
And grabs the flying man behind.

A growl—a rip—ah! never, never,
Did pants from ties so quickly sever;
Freed from his clothes, Adolphus starts,
And o'er the fence like lightning darts.

The modest moon still brightly shone;
Such sights she oft has gazed upon;
Such sights, while Time remains, she'll see—
And she was there, but where was he?



HOSPITALITY.

(Applicable to more than one phase of life.)

Maud (*Daughter of the House.*). "There are those two Miss Tomlinsons—horrid things! I wonder who asked them!"

Eva (*ditto*). "I did. Papa made me. But we needn't find them Partners, you know!"

Incurring a Tremendous Risk.

They incur a tremendous risk who sojourn or emigrate to reside in districts where malarial disease is prevalent, without medicinal means of fortifying their systems against the periodic scourge. The danger to bilious subjects, and to those who lack bodily stamina, is particularly serious. A preventive and curative agent of known anti-malarial efficacy should be frequently used and constantly kept at hand by such persons; and on none can they rely with such certainty of protection and aid as Hostetter's Stomach Bitters. This grand specific roots out every vestige of the malarial poison from the system, and endows it with an amount of vital activity and repelling power that nullifies the influence of miasma. It also prevents and remedies disorders of the stomach, bowels and liver, which are particularly prevalent in malarious regions, and is a incomparable general invigorant.

$250 in Premiums.

PRINGLE'S NEW HYBRID SPRING WHEATS.

CHAMPLAIN.—A bearded variety—a cross between the Black Sea and Golden Drop. Its strong and vigorous straw, growing 6 to 12 inches higher than its parent varieties, stands erect, frequently bearing, even in very ordinary culture, heads from 5 to 6 inches in length, containing from 60 to 75 kernels each.

DEFIANCE.—Another variety of spring wheat of the highest promise, the result of a series of experiments, to incorporate superior qualities upon the hardy stock of our common Club Wheat, by hybridizing it with one of the finest, whitest and most extensively grown sorts of the Pacific Coast. This variety displays great productiveness, vigor and hardiness. It is a beardless, white chaff wheat, with heads frequently 5 to 6 inches long, very closely set with large white kernels, frequently numbering 75 to 80 to the single head.

Price of each variety, $1 per lb.; 3 lbs., $2.50, by mail.

In order to induce Wheat Growers to give these new sorts a thorough and universal trial, we offer **$250 IN PREMIUMS** for the largest quantities grown from 1 lb. of seed, also for the 20 largest heads. For particulars see our Wheat Circular, mailed free to all applicants.

Bliss's Illustrated Seed Catalogue and Amateur's Guide to the Flower and Kitchen Garden. 216 pages, price **35 cents.**

PETER HENDERSON & CO.
Seedsmen, Market Gardeners, and Florists,
35 Cortlandt Street, New York.

Specialties for Farmers

East India, Egyptian or Pearl Millet.—This valuable annual forage plant has been illustrated and fully described in the American Agriculturist, Weekly Sun, Farmer's Advocate, and other papers. It is the best and most profitable plant for green soiling and fodder. Can be cut four to six times. One pound of seed will sow an acre. Price $5 per lb.; 25 cents per packet, or 5 packets for $1.00

Chufas or Earth Almond, (Cyperus esculentus). Better than corn for feeding hogs, sheep and poultry will yield three times as many bushels per acre. Price 60 cents per quart, by mail prepaid; $2.50 per peck; $8 per bushel.

Prickly Comfrey.—Recommended for the feeding and fattening of stock, and for increasing the milk of cows; enormously productive. Price of roots, $2 per lb., by mail, prepaid.

Compton's Early Field Corn.—Was exhibited at the Centennial Exhibition, where it received honorable mention for its extreme earliness. Price 60 cents per quart, by mail, prepaid; $1.50 per peck; $5 per bushel.

Circulars, fully describing the above, and many other good things, free by mail, to all applicants. Also, my Descriptive and Illustrated Catalogue of Garden, Farm and Flower seeds New and Rare Plants, etc., etc.

WM. H. CARSON, Seedsman.
125 Chambers St., New York.

STOCKBRIDGE
MANURES

Originated by Prof. Stockbridge, Prof. of Agriculture in the Massachusetts Agricultural College.

Made for each crop, furnishing the plant food which each requires. They have been used for five years with such success that in 1877 they were applied on over 10,000 acres with excellent results. **Send for Pamphlet. Mailed Free.** Also for sale, Agricultural Chemicals.

W. H. BOWKER & CO.,
3 Park Place.....New York.
43 Chatham St.....Boston.

Fitzhugh American Hay Elevator.

The greatest labor-saving machine in use; will do more work in the same time and space than any other machine of the kind manufactured. Is very durable, easily put up and operated, and has the capacity of hoisting 2,000 lbs. and carrying it back any distance required. It has the merit of being readily adapted to any kind of a building. It has been awarded premiums at a great number of State and County Fairs, and received the highest prize—a Diploma and Medal—at the Centennial Exhibition—as the simplest and best of its kind. Exhibit shipped to Paris Exhibition. Over 5,000 have been sold since Sept. 1st, 1874, which have given entire satisfaction. A price-list and full particulars, with instructions how to put up and operate, will be sent on application to the Patentee and Manufacturer.

Price $12.00. J. R. FITZHUGH,
1709 Barker St., Philadelphia, Pa.

FLYING MAMMALS.

Among the transition animals which serve as connecting links between the principal masses, so as to form an unbroken chain from the most imperfect up to the most perfect, not the least interesting are those which, while they distinctly belong to the mammalian class in the Animal Kingdon, yet by their peculiar conformation link it with the class immediately below—that of birds. Of those there is quite a large number of species and genera belonging to several families and to three orders—the Cheiroptera or wing-handed; the Quadrumanous, or four-handed; and the Rodentia, or gnawing animals. In common language these orders are represented respectively by all the bat tribes, some members of the monkey, and some of the squirrel races.

Between the various species of the bat family there is a vast difference in size and appearance, ranging, as they do, from the hideous little nocturnal prowlers of our own neighborhoods to the rather handsome Flying Fox of Africa, Polynesia, and Southeastern Asia, which attains the size of a squirrel, and often measures four feet across its extended wings. The bats may well be regarded as the chief representatives of the transition line of animals, both on account of their vast numbers, their widespread distribution over every part of the habitable globe and the fact that the membraneous webs extending between their limbs, serve all the purposes of veritable wings, enabling them to soar about with an ease and power denied to many members of the feathered races.

Among the flying representatives of the monkey race the largest and best known is the Flying Lemur, also called the Colugo, or Cat Monkey. There are several genera of the family, ranging from the size of a rat to that of a cat, all inhabitants of the East Indian Archipelago. The body is surrounded by a hairy lateral membrane, extending from the sides of the neck to the base of the feet, embracing the wrists, continued between the legs and inclosing the tail, as in many bats. When extended this serves as a parachute to sustain the animal in its astonishing leaps, often of 100 yards, from tree to tree. When traveling among the branches the female carries her young in an abdominal pouch; their food consists chiefly of insects, small birds, eggs and fruit; their color varies from light gray to russet; and although emitting a somewhat disagreeable odor their flesh is considered palatable by the natives. They constitute the connecting link between the monkeys and bats.

Of flying squirrels there are three genera and a multitude of species. Their common characteristic consists in their being provided with wing-like membranes extending along the flanks between the anterior and posterior limbs. These membranes are covered with hair, like the other parts of the body, and constitute, when outspread, veritable parachutes, which enable them to sustain themselves in mid-air longer than the commonality of animals, and to clear from 50 to 100 yards at a single bound. Of them the Taguan is the best known species. When the creature wants to take one of its marvelous leaps it stretches its four limbs to their fullest extent and is up-borne through the air on the parachute-like expansion which extends along its sides. Its total length is nearly three feet, the tail measuring about one foot eight inches. The color of the animal is a clear chestnut, deepening into brown on the back, and becoming more ruddy at the sides. The little pointed ears are covered with short, soft fur of a delicate brown; the tail is heavily clad with bushy, grayish-black hairs. The parachute-like membrane is delicately thin, and covered with long fur, chestnut on the upper side and beautiful silvery grayish white on the lower. The Taguan belongs to the genus Pteromys, whose members are much larger than those of the other two genera and inhabit Southeastern Asia and the Indian Archipelago. The Sciuropterus are the smallest of the family. They inhabit the northern parts of the globe, including our own country; and intermediate in size are the Anomalures, dwelling on the west coast of Africa.

TAGUANS—(A Species of Flying Squirrel.)

The Vineyard.

GRAFTING THE GRAPE FOR HYBRIDIZING.

D. S. MARVIN.

There are so many persons now interested in trying to improve our native grapes that a few notes by the way, of the processes, experiments, failures and successes, of the writer will doubtless interest many of the readers of the Rural. Even if it were otherwise desirable, however, space and time would forbid me to detail all my experiments, carried on now for quite a number of years. But one series of experiments and their results are so interesting that I will attempt to sketch the processes and speak of the reasons for their hopeful results, as it points to the way and manner that will probably lead to important improvements, and give us, in a generation or less, results that have required thousands of years to accomplish in Europe, by slow increments of gain, through the natural processes of amelioration by cultivation.

It was long ago observed, in the attempted improvements by growing seedlings of Pears, Apples, Plums, etc., that seedlings from grafted fruit yielded better results than from natural fruits. The seeds were lessened in quantity and the fruit enlargod, for the stock, being different from the top, the sap thus generated being blended and commingled complicated the result, greatly increasing the chances and tendencies to produce sports, when, if the normal seed of the native plant alone had been used, it would have repeated itself, and no variation would have ensued. It is by the production of sports that we are enabled to go beyond the ordinary variations accomplished by nature through ameliorating circumstances of propitious surroundings. Such are the conjunction of a genial climate and a favorable soil to the seed of some plant carried by accident in the coat or intestines of some animal, or the favorable contiguity of two plants of like or kindred botanical classification happening to blossom at the same time and mingling pollen from one upon the other, the seed dropping and germinating where it could, yet finding the proper surroundings for full development. Why some one has not thought out and applied grafting long ago for improving our native grapes, only shows how young we still are in this important culture. Another most potent reason for retarded improvement has been that so much precious time has been wasted, in trying to utilize Vitis vinifera, the European grape, on the Atlantic seaboard, when, in reality, it will only succeed for hot-house culture. We are only now just realizing and beginning to act energetically upon this stubborn fact. But to show that it is not even yet comprehended in its full import, some hybridists continue to use pollen from V. vinifera to the present time, thinking that they can, by some hocus-pocus, overcome the laws of nature in mixing.

After studying and thinking over the subject, some eight years ago, when the Eumelan was first introduced, and recognizing it as an æstivalis grape, I grafted it upon an Iona root for hybridizing purposes, and have now for three years fruited a number of seedlings grown from the first cluster of grapes grown upon this vine, hybridized with pollen from Delaware, Iona, Concord, Adirondack, Martha and Walter. I used pollen from so many sources purposely, to complicate, if possible, the result, and was enabled to see that I had made the desired impression, for the cluster was full and compact, while the normal clusters, every one who has fruited the Eumelan knows, are more or less emasculated. I chose the Iona for the stock because, in my judgment, it is itself a hybrid between V. Labrusca and V. cordifolia, although classed in the books as Labrusca.

The Eumelan being a genuine V. æstivalis, I had the strains of two, if not three, botanical classes united, from which to grow my seedlings, and am now making experiments with double grafted hybrid seedlings, but have not fruited them yet. I did not take the pains to cut off the stamens of the Eumelan, for I had the idea that I could, in part, preoccupy the stigma with the transported pollen, on account of the preference of

plants for pollen from other sources, and I should be glad of a partial self-impregnation, if I could bring it about. I was aided by the stigma of the Eumelan being so much more conspicuous than those of some other varieties. I could see just where I was placing the pollen, and I simply used clusters from the other vines, touching the stamens of the transported clusters, with their fresh pollen grains adhering, to the waiting pistils at the right moment,—just after the viscid water appeared thereon in the morning,—repeating the operation next day upon the stigmas which showed, by the viscid water reappearing, they had not been fertilized. Of course, pollen can only be had in this way, where vines blossom together, or nearly at the same time; but by shading to keep them back, or throwing artificial heat upon others with boards set up on the north side to reflect the heat of the sun and hasten blossoming, fresh pollen can always be obtained. It is so much more certain to succeed than pollen that has been retained any length of time, that the little extra trouble is well repaid. I would add here, to illustrate the matter and increase the pertinency of such experiments, that I have grown a great many unhybridized seedlings, from all sorts of vines, and in all sorts of ways, only to reject them with disgust after fruiting, for we already have enough of crude varieties. There is seldom any gain; hardly one in a thousand will sport enough to show an advance. Nor have I had any good results from mixing the pollen with the same botanical classes for varieties; nor yet in using pollen from V. vinifera hybrids with our native classes, or their seedlings. All of my experience goes to show that any admixture of V. vinifera with our native classes is at the expense of the health of such seedlings, and my advice to others would be to depend wholly upon improving our own classes and varieties. The Eumelan, in my judgment, is invalnable as the pistillate parent, though imperfect in itself.

Few Americans like the pulpy, insipid taste of some European grapes: the more sprightly and healthy acids of our natives are preferred, but seeds at the expense of pulp enlarging the berry, are even less desirable. Herein is one of the marked defects of our native grapes, especially of our Labrusca class. How to eliminate this excess of seeds is one of the problems to be solved, and to which those studies are, in part, directed. Nature, under normal conditions, cares only to perpetuate her kind; all the processes of the plant seem to be directed to this end, viz. the production of seeds.

The important part to man in our fruits is the covering, but man by taking advantage of certain tendencies, can make what is only an accessory to become the principal object, and he has been enabled, by working through long periods of time, to direct and control these minor forces, so as to develop for his sustenance the rich fruits we enjoy. Still too much of the energy and natural forces of our vines are wasted in the development of so many seeds. To ripen these and develop their harder or stony parts is wherein the great call upon the forces of the vine is made. If the clusters be too abundant, the call is sometimes so enormous as to almost kill the vine, the ripening processes fail and the season is worse than wasted. If by grafting or any other process the seed can be lessened in numbers and diminished in size, then more of the energies of the vine may be directed to maturing the pulp and enlarging the berry, thus maturing more bulk of fruit at greatly lessened expense to all the vital energies of the plant.

Now for the results of the experiment above alluded to: After rejecting the imperfect ones I find the fruit of some of these hybrid seedlings rivals in hight, pure tone, and delicacy of flavor Vitis vinifera, the European grapes of California. I am an ex Californian and know whereof I speak. The emasculated clusters of the Eumelan are replaced by full, compact clusters, (some of them are a week earlier) with abundance of pollen, perfect pistils and stamens, never failing to set fine large compact clusters, more than the vine can possibly carry. The colors of some of them, too, are new ones in American grapes. In one or two the skin and pulp are so transparent that the seeds can be seen, and what is pertinent and important, the seeds are smaller and less in numbers. This is just where the gain from grafting was desired, and what the experiment was made for and expected to accomplish. I have only come short of my hopes in failing to increase the size of the berry up to the standard of the popular taste, but the failure is more apparent than real, for the experiments must be repeated again and again from such improved vines. I have more pulp and less seeds. Our people admire every thing large, but I do not despair. We have in the Union Village a rival of foreign grapes in size of berry and bunch, if I can refine and bring up its low standard of quality, put pulp in place of seeds, and retain its size, I shall feel that I have not lived in vain.

Let me add here I have no new seedling grapevines to sell nor will I ever have, unles I obtain decided improvements.

If any readers who are *bonafide* workers in this speciality and per-consequence in the possession of practical experience in this department of horticulture, entertain different views, or have valuable experiments to communicate, or if a number of them desire more specific directions for carrying on their hybridizing processes, then write to the RURAL NEW-YORKER to that effect. Let the public reap the benefit of the knowledge. Exchange of views based upon such foundations will always interest. Persons writing for information should study up the subject, and begin their experiments at the present state of our knowledge, not repeat old experiments. There is usually much time lost here. The study is an enticing one. The interested student will be impatient for the annual procession of the seasons. His life will be beguiled and robbed of many of the ills that fall to the lot of man. He will be enticed and carried close to, and perchance may penetrate into, some of the hidden secrets and mysteries of nature, and science.

Jefferson, Co., N. Y., March 1878.

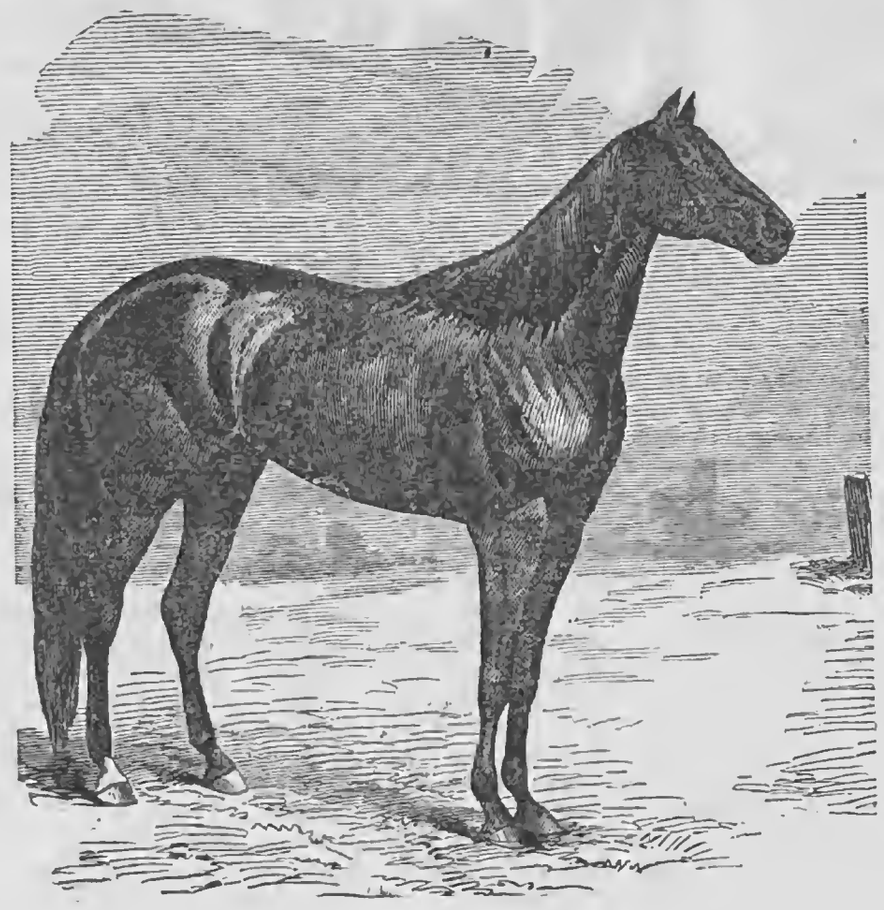
The Horseman.

NOTED TROTTERS. NO. 4.

YOUNG POCAHONTAS.

POCAHONTAS, the younger, is interesting to the public mainly from the circumstance that she is a very fast-trotting daughter of the famous pacing mare of the same name. Before she had done more than give promise of great speed, she was purchased by Mr. BONNER and thus withdrawn permanently from the trotting track where she would doubtless have made a very excellent record. Her sire was the noted trotter Ethan Allen and she inherits the beauty of form which distinguished him in his prime, while her mother bequeathed to her a great deal of her marvelous staying qualities. A few years ago her owner declared that she was able to outspeed Dexter anywhere on the track, and at a private trial she went to the half-mile pole in 1.04½ and at earlier trial sped over a full mile in 2 m. 18 s.

Old Pocahontas, the most remarkable pacer that ever spurned the trotting track, was foaled in 1847 in Madison township, Butler Co., Ohio. Her sire was Irons' Cadmus, by American Eclipse, but so little was thought of her in early days that as a two-year-old she was knocked off at a public sale to the highest bidder for $30. She was engaged chiefly in farm work until 1853, having passed through several hands in the interval. At the latter date on a trial under saddle she showed a 2 58 gait, and was at once subjected to a system of training. Her first contest was with a very fast pacer, Ben Higdon, whom she easily beat in 2.34. In 1854 she distanced Tecumseh and Dolly Spanker at New Orleans in 2 20, though the contest took place only two months and nine days before she dropped a foal. After this remarkable display of speed and pluck, it was for some time impossible to match her at any odds; and at a private trial on the Queen's Course, L. I., in the fall of 1854, when placed on the track in excellent condition and accompanied by a running horse she made a mile in 2 08½. Her best public record, however, was made in her match with Horo, June 21, 1855, she to wagon, he to harness, when she distanced him in the first heat in 2 17½. After this it was impossible, in those days, to get her matched, and she was put to breeding, and Young Pocahontas was her second foal.



YOUNG POCAHONTAS.

The Poultry Yard.

ORIGIN OF BRAHMAS.

HENRY HALES.

I HAVE read the articles contribnted to the RURAL by Mr. MINER and Mr. WALLACE on the origin of the Brahma, and am also acquainted with the claims of Mr. G. P. BURNHAM in the same connection. This subject has at times produced much acrimonious dispute as to claims of priority. Mr. WALLACE says he saw Light Brahmas at Capt'n. STEWART'S estate, in Ireland, in 1846. For this statement he is sharply taken in hand by Mr. MINER. Now, I say distinctly, I have no wish to enter into this Brahma controversy which has been already made a subject of notoriety; yet I can see no reason why fowls brought either from China or India may not have produced in Ireland or England birds somewhat like the American bred birds, which were brought originally from China to this country. Of course these would not be called Brahmas, as the name was not then known.

From 1843 to 1852 great numbers of Asiatic fowls were imported into England from China; yes, and from India too; but fowls of this kind brought from India were fowls that had been taken there from China. The extensive trade which exists between the two countries easily accounts for this. East Indians are people fond of breeding poultry and pigeons—a fact well known. As two shipments of these birds are claimed by Mr. BURNHAM to have come from China, one to New York and the other to Philadelphia, and as Mr. MINER claims that another from which Mr. CHAMBERLAIN'S were bred, came from India, why should the probability ever be denied that some such birds may have reached England, especially when the trade between England and those countries is of such great magnitude compared with their trade with America. It is asking a trifle too much of our credulity to require us to believe that while these three American shipments of fowls all produced Light Brahmas, yet none could be produced in England. And still in London alone there is a large dock of splendid vessels continually going and coming between England and India, and taking their name of East-Indiamen from their occupation. Many of these are manned by East Indians, and are always bringing over everything in the way of novelties that the East produces both from China and India.

I do not say that birds were so introduced that bred Brahmas in the United Kingdom; but I do think it very probable that birds may have been bred there very much the same as our Brahmas, quite as early as if not sooner than we had them here, without its being generally known. Every year thousands of people are going to and fro between India and Great Britain; trade between India and China is largely carried on by British; now, why should it not be probable that birds similar to those that came here three times should have been landed there too.

"But," says Mr. MINER, "Cap. STEWART'S fowls were probably Chittagongs." Why Chittagongs? Cochins were introduced at that time. From 1843 to 1846 many importations took place. The Queen had them on exhibition at the show of the Royal Dublin Agricultural Society, in April 1846, and they were very common a few years later. In 1852 I was present at the Poultry Show held in Madame TUSSAND'S Rooms, Baker Street, London. Immense numbers of Cochins figured there of all the colors now known. The step from White Cochins to Light Brahmas is not a very deep one. I have often seen White Cochins—or birds exhibited for such—so much the Brahma shape that they only required the penciling on neck, and black on tail and wings to make them perfect Light Brahmas, with single combs, like those of many at that time. Mr. MINER asks why Captain STEWART did not exhibit his fowls at poultry shows. Does not Mr. MINER know that in 1846 poultry shows were scarcely established anywhere except the local shows in some counties in England, where some breed was made a hobby of, and local rivalry was brought out, as in Yorkshire with the Mooneys? Poultry were also an adjunct to Agricultural and Zoological Societies. One cannot but feel a little surprised at a gentleman of Mr. MINER'S experience and knowledge on this topic, asking such a question. Where were the poultry shows at which they could be shown? The great London Show of 1852 may justly be called the first great poultry show in England in which the public took interest.

Mr. MINER also says English officers and French clergyman, are not likely to be judges of poultry. I know nothing of French clergymen, but I do know that many British officers are men reared in country homes with stock of all kinds surrounding them, as well as aviaries of birds, game, etc., and that they would be just the men to appreciate a good fowl. I am acquainted with a number of American Army officers and, singularly enough, they are all poultrymen; why should British officers be an exception?

Dairy Husbandry.

DAIRY PRODUCTION THE YEAR ROUND.

E. W. STEWART.

OUR great dairy interest is represented by 11,000,000 of cows, absorbing a capital of $500,000,000 in this stock, and the land necessary to maintain these cows cannot be less than fifty millions of acres, which at even $20 per acre, represents a value of $1,000,000,000. This great industry is gradually being reduced to order and system. The factory system has revolutionized cheese-making and is fast doing the same for butter-making. Dairy butter has been undergoing a fearful ordeal during the last few years in competition with creamery butter, and it is now only a question of time when all our market butter will be made in creameries or upon the creamery system. The old haphazard way employed in private dairies could not stand against any regular system; even oleomargarine, (caul-fat butter) is preferred to it. The time has already come when this miscellaneous class of dairy butter can be sold only for grease or baker's shortening. It will not therefore be produced much longer; the loss is so great that it cannot longer be borne. It has not for the last year even paid for the labor of production. This unanswerable argument will compel the patronage of cheese factories or the establishment of creameries for the improvement of this large class of dairy product.

The art of keeping butter, which has been made in good order and flavor, is so little understood that many millions of pounds are spoiled, every year, in endeavoring to hold for a better market. In fact, the public taste is fast demanding fresh butter during the whole year. The summer or fall made butter is passed by for fresh-made winter butter having a pleasing artificial color. The art of coloring has been so much improved that city people, in looking at these pleasing tints, can smell the clover fields in January. They spread this delicacy upon their bread with such absolute confidence in its flavor, that straw, bran and meal are transformed into the nectar of the grasses.

The drift is now all toward fresh made butter, and this is well for the dairy interest, because a much larger proportion of butter is passable, even agreeable to the taste if used fresh than if kept, even for one month. There can be no doubt but the present state of the art of butter-making requires the product to be used within ten or twelve days after making; and this system in full practice would save a loss of thirty to fifty millions per year to dairymen.

To carry out this system, one-half of the cows must drop their calves in October or November, and the other half in spring. It is not necessary that each herd should be thus divided, but different dairymen may follow the spring or the fall system. Yet in large herds, it would

probably pay better to make butter throughout the year, and supply the same set of customers both summer and winter. There is much in a cultivated or habitual taste for a particular make of butter, and a dairyman has the advantage of this taste when he supplies the same set of customers constantly.

Winter dairying is generally supposed to be more expensive than summer dairying, but this opinion is not well founded. It is based upon the supposition that pasturing is cheaper than stall feeding, yet the dairyman is able, generally, to winter a cow upon one acre of good meadow, whilst he uses three or more acres to pasture her in summer. Certainly, this labor of cutting and storing the grass upon one acre and feeding it out in winter, cannot be worth more than the use of two acres of land. This subject presents so many points for consideration that I shall continue it in another article.

Rural Architecture.

A GENERAL-PURPOSE BARN.

We give below the plan of the basement and ground floors of a general-purpose barn, having a strong bias in the direction of a stock barn, and costing $4,000. It is calculated, as its name implies, for that system of farming commonly called "mixed husbandry," in which the growth of grains, of forage plants, and stock raising have about equal prominence in the general farm economy.

This barn is 97 feet long and 48 feet wide, one story and basement. The basement is 9 feet 6 inches and the upper story 16 feet in hight. It furnishes hay-room, with good mowing for 200 tons of prairie hay, or its equivalent in other fodder or straw; its granaries will contain 2,000 bushels of grain; and it has stall room for 32 head of cattle and 7 horses, with 4 box stalls for bulls or for cows requiring extra room.

The plan of the building was furnished to us by Professor E. M. Shelton, of Kansas Agricultural College, and was made with reference mainly to the wants of Kansas and other prairie farmers, and in the hope that it might furnish to them some useful hints in the construction of farm buildings.

CATTLE STALLS.

The single tiers C C and the double tier A are all arranged upon the same plan, the heads of the animals in either case being turned towards the main passage-ways, from which all feed is supplied. Into these passages the hay is conveyed from above, through feed shafts not shown in the cut. Each stall is 4x8 feet, including manger. At the rear of the stalls is a manure gutter six inches in depth and twenty inches wide; and beyond, next the wall and box stalls, is a passage, on the level with the floor, 2½ feet in width. The double tier A has a similar gutter four feet in width, separating the two tiers of stalls. The very simple form of manger in use in these stalls has given perfect satisfaction. It is of variable width, the front being simply a 2x10-inch plank sliding in cleats in the partitions, and resting on the floor. The advantage of this arrangement is that this front of the manger may be placed well forward or back to accommodate the animal, compelling him to lie in such position as to void in the gutter.

FEED BINS.

The feed bins, marked G, are 4x12 feet, supported two feet from the basement floor, and having sloping bottoms so that the feed slides easily to the front, where it is drawn out by a spout in the front of each bin. The feed is poured into the bin from the floor above, through hoppers not shown in the cut.

ROOT CELLAR.

The root cellar will hold nearly or quite 2,000 bushels of roots. The roots are poured from the wagon on the outside of the barn through the window into the cellar, and are taken from there to the slicer in the alley and distributed to the cattle on either side.

BOX STALLS.

The four box stalls marked Q are two of them 10x10 feet and two 10x11 feet. They are chiefly for bulls and other animals requiring more room and stronger quarters than ordinary stalls furnish. There is a great advantage in using these boxes for cows during calving time and for sick animals generally. The boxes are boarded up with rough lumber to the hight of six feet, and have earth floors. Each stall opens into the alley D, through which the animals are led and the manure wheeled. Hay for the animals is conveniently obtained from the great bay E, which extends from the roof to the floor of the basement.

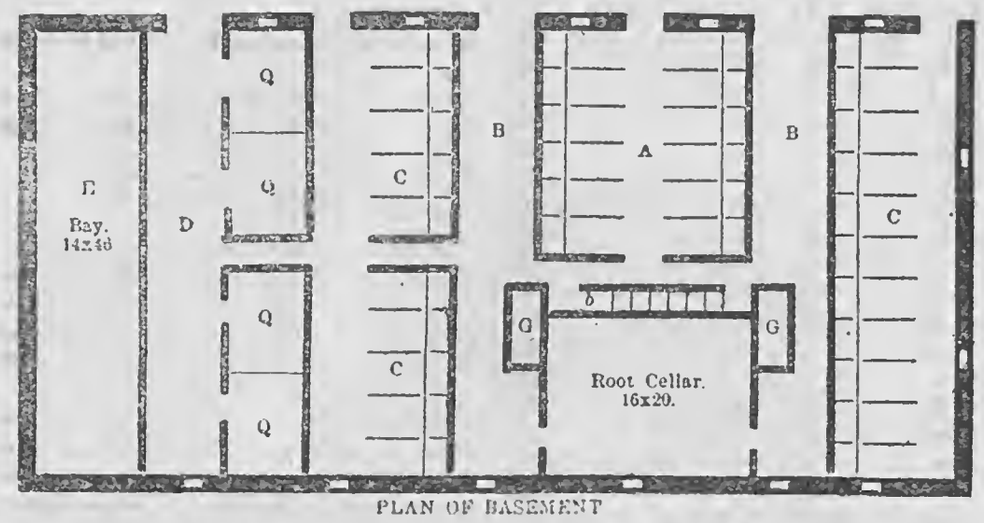
The main floor is about three feet above the ground level, and entrance is gained either at the front or end of the building, by easy approaches of earth and short bridges of slight slope. The width of these main door-ways is 12 feet, and the main and threshing floors are 13½ feet, a space amply sufficient for the easy passage of the largest loads.

BAYS.

The bays need little description beyond that given in the cut. In addition to the bays, the lofts over the horse stable, granary and tool-room furnish a great extent of mow room; while even this may be increased if desired by covering over most of the main floor and employing this loft for the storage of grain and hay.

THE GRANARY,

marked K, is 15x20 feet deducting stairway, and is divided, by firm partitions, four feet in hight, into five bins of variable size. The alley opening into the main floor is six feet in width, furnishing ample room for operating a fanning-mill, stowing sacked grain, etc.



PLAN OF BASEMENT

THE HORSE STABLE

occupies a space on the ground floor 16x34, and consists of five single stalls and one double one, Each stall is 5x9 feet, including manger, and exclusive of the alley seven feet wide passing at the rear. At the rear of the stall is a blind gutter, sunk six inches beneath the floor and covered by a plank on a level with it, which carries the liquid excrement to the basement drain at the rear of cattle stalls.

THE VENTILATORS,

marked *a* in the cut, are shafts 3x3½ rising perpendicularly from the floor to near the roof, the direction of which they follow to the apex, where they terminate in two double-roofed cupolas. These shafts are made of smooth-planed lumber, and are provided with trap doors in their sides through which fodder is pitched to the cattle in the basement. Additional ventilation is provided for in the basement by the thirteen area windows each of which is hinged at the top, and by means of rope and pulley may be opened or closed as may be needed. Thus far, the light and ventilation of the basement, obtained by these simple means, leave almost nothing to be desired.

The stairway leading from basement to ground floor is indicated by *b* in both cuts.

THAT MODEL PIGGERY.

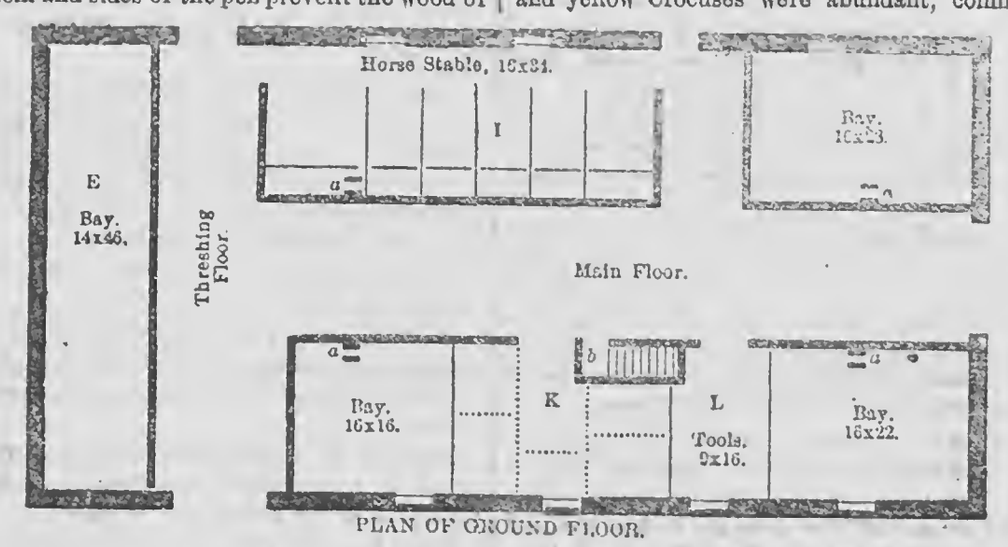
To make it clearer to the inquirer, Mr. Lehman, I would say that I do not believe in a cellar under a piggery, but a shallow, tight half-cellar which, cemented at bottom and sides, serves as a foundation for the wooden upper portion of the building, and also to make and save manure in. The depth can be regulated to suit one's convenience. I would have it not over two feet in depth when completed, if it extends two feet above ground. About three feet below the window stools will be found to be the right thing.

In this shallow cellar the litter is supplied in generous quantities, and the amount of manure made will be surprising to one not accustomed to utilizing the hogs in this way. The cemented bottom and sides of the pen prevent the wood of the piggery from destructive contact with the hogs and manure. Nothing is much more injurious to wood than hogs and their excrements.

The improvement suggested by E. L. M., is a good one, and I accept it with thanks. In the elevation view, the artist made one mistake, and that is in the roofs, which should be reversed. The main building is represented as the extension and *vice versa*. I would use cast iron feed troughs and spouts. If desired the cellar can be divided by walls under each separation between pens.

J. W. Lang.

Waldo County, Me.



PLAN OF GROUND FLOOR.

Floricultural.

RARE FLOWER SEEDS.

In looking over the numerous seedsmen's catalogues, I am struck with the great additions in the shape of novelties, that have been made in the lists of flower seeds. I note the following especially as worthy at least of trial:

Dwarf Large-flowering Cineraria, from France—a new and beautiful strain and of elegant habit, one a pure white and the other a metallic red, both said to come true from seed; the only objection to them being the price, which I notice is *only* $2 a paper.

Eryngium Leavenworthii, from Texas—one of the most showy decorative annuals introduced for many years.

Eschscholtzia Californica, Mandarin, from England. The flowers of this improved variety are of a most brilliant orange-crimson, said to be entirely distinct from the old variety.

Liatris pycnostachya, from Kansas—a tall-growing, beautiful perennial, with spikes of purple flowers.

Pentstemon Cobæa var. purpurea, from California—a magnificent variety of this tall-growing and large-flowering sort, with purple flowers.

Petunia, Large-flowering double fringed, from Germany. The flowers are said to rival the Double Poppies and, in richness of color and delicacy of tint, the finest Carnations.

Phlox Drummondii grandiflora splendens. The richest and most beautiful of all the annual Phloxes.

Vernonia Lindheimeri, from Texas. Growing from two to three feet high, and producing flowers of a beautiful purple; one of the best novelties of the present season.

x.

THE FLOWER GARDEN.

W. Falconer.

PLANTS IN FLOWER.

An exceptionally open winter and early spring have given us flowers in March that we seldom look for till April. On March 1st, yellow Crocuses (C. Susianus) and Snowdrops opened their first flowers; on the 5th, these became more abundant and the Crimean Snowdrop and another yellow Crocus (C. Oliviore) and a bluish one (C. reticulatus) also bloomed out; on the 8th, the Christmas Rose or Hellebore reared its large snowy blossoms above the mulching of leaves; and by the 10th, Snowdrops and yellow Crocuses were abundant, common blue and white Crocuses began blooming on the 11th, and on the 18th, the lovely blue Squill (Scilla Sibirica) displayed its first flowers, as did also the Winter Aconite (Eranthus hyomalis). On the same day, on removing the thin mulching from off English sweet-scented Violets, I found some flowers of them and likewise of Pansies. To-day (20th.) Iris reticulata is bursting its blue blossoms and the buds of Cyclamen coum and Hepaticas promise to open in a couple of days.

HERBACEOUS PLANTS.

Remove the mulching from these and if any of the plants have grown under it and present a bleached appearance, loosely scatter some dry strawy rubbish over them to remain for some days, otherwise the sunshine and sudden exposure may hurt them badly. The removed covering should be cleared right away so that the wind may not blow it about and litter the place; the rough stuff, as straw and stems, may be put in the rot-heap, and the tree leaves in a pile by themselves for leaf-mold. The wetter and more decayed the leaves may be the better, but free them from sticks, and if any part of them be mixed with pine-tree needles don't use that portion in the leaf-soil heap, but, instead, pile it in the rot-heap. Asters, Bergamot, Veronicas, and many others often overroach their limits, hence reduce the clumps; better have a few good stems than a host of starvelings. Sometimes the clumps got run out by impoverishment and in this case lift, manure heavily, dig deeply, and replant. In the case of many plants you will now observe "hollow crowns," that is, a hollow in the middle of the clump and, as such is detrimental, fill it up with earth or lift, and reset the plant. This is an excellent time to lift, divide and transplant herbaceous plants, and the sooner it is done the better. Do not disturb Lilies if you can avoid it, and spring-bloomers usually flower better if unmolested at this season. Cut over all remaining old flower-stems, and push ahead all manuring, digging and fixing up generally. Such work can now be done more easily and spiritedly than if delayed later, and it is better for the plants.

LAWNS.

If there be any grading and seeding-to-grass to be done, do it at once, and give the young grass the best chance possible before the advent of hot weather. Where practicable, edge newly-formed lawns with sod, particularly along the walk verges. Sodding done now should take kindly. Some people mulch their lawns over winter with manure while others do not apply it till March; at any rate rake off the roughest before active growth begins. Now is the time to rectify inequalities, as hollows or hacked sod, in the lawn; sometimes the affected part had better be skinned and leveled and at other times a top-dressing of soil smoothened over and lightly rolled rectifies inequalities. All lawns may be beneficially rolled in spring, but I would rather leave it undone than use a very heavy roller. Mossy grass, as that in shady places and under trees, also grass thickly set with weeds, had better be raked deeply and rigidly with a long-toothed iron rake, and the moss and weeds removed as much as possible, and a good top-dressing of rich soil and some grass seed applied.

SHRUBS.

The sooner deciduous trees and shrubs are now planted the better for themselves; I like to give them a fair foot-hold before they begin to grow. For common shrubs ordinary digging may give them depth enough, but for trees, if the holes be made deep and wide and filled up with a mixture of good soil, the effect will be afterwards visible in the extra promotion of growth and withstanding of drought. Plant no deeper than they were in the nursery or wherever else they were grown; spread out the roots somewhat horizontally, introducing the soil between the rootlets, and if necessary apply at once a strong stake as a support. If any doubt exist as to the safety of a transplanted shrub or tree, cut it well back and it will be almost sure to start. If manure be given to the soil at planting time, apply it broad-cast and plow or dig it under, and under no circumstances put a mass of it in the hole under a tree. To newly planted trees if not objectionable, a summer mulching of decayed manure or leaves is highly beneficial by partially preserving coolness and moisture in the soil. Finish pruning. Save the cleanest and straightest of the prunings for stakes, and burn the remainder. In pruning leave a goodly supply of flowering wood, remove over-crowding stems and branches, debilitated shoots and useless spray, and aim at having robust specimens full of strong young wood, rather than gnarled decrepitude.

BULBS FOR THE FLOWER GARDEN.

W. C. L. Drew.

TIGRIDIA.

One of the most curious and beautiful of plants is the Tigridia. It is a native of Mexico whence it was introduced into European gardens, creating a *furore* among amateurs only equaled by that caused by the introduction of the Fuchsia. It is frequently called the Mexican Tiger Flower.

The flowers are from three to four inches in diameter, the center of each flower being de-

pressed and resembling shell work, the depressed portion is marked and variegated in the most fantastic of manners. It is from this odd marking the cognomen of Tiger Flower was derived. The outer half of each petal, though presenting a broad surface, is very light and airy, and of one color only, according to variety.

There are two varieties in cultivation, T. conchiflora, the center of which is a brilliant yellow variegated with black, and the outer portion a deep orange. T. pavonia has a golden yellow center variegated purple-brown, the ends of the petals being a brilliant crimson or scarlet.

The only objection to the Tigridia is the short life of the flower; it appears very early in the morning and on a cloudy day or if planted in a cool, shady corner, it will remain open nearly all day, but an hour or two of sunshine destroys the beauty of the flower. The next morning, however, a fresh supply of the queer blooms appears. Indeed a small bed of them will very seldom be without flowers every morning. The foliage resembles that of the Gladiolus, the flower stems attain a hight of twelve to sixteen inches.

The bulbs which resemble those of the Tulip, though usually smaller, should be planted in May in a light, rich compost. They should be set in a place where they will be shaded until noon at least. Set them two inches deep and four inches apart; on the appearance of cold weather take up the bulbs, dry them off as you would Tulips, and pack in tight boxes to keep from mice and rats; gophers are very fond of them also.

TRITOMA.

The Tritoma, though not exactly a bulbous plant, is classed among the summer-blooming bulbs and tubers. During its season of bloom, which is in September and October, it forms a very conspicuous object in the garden. It is particularly adapted to growing on the edges of ponds or lakes, but while thriving in such situations it is equally adapted to garden culture, and forms a magnificent addition to foliage beds.

European florists offer a number of varieties, but there is very little difference in them, certainly not enough to make them desirable. Tritoma Uvaria is the variety in general cultivation: it is a strong-growing plant, enduring the winter in the open border in all except the Northern States of Maine and Minnesota. [It is not hardy north of Philadelphia. Eds.] The flower stem attains to a hight of four to five feet, crowned by a spike, twelve to eighteen inches long, of red and orange pendent blooms. The Tritoma is frequently known as the Red Hot Poker from the supposed resemblance of the flower spike to that well known kitchen appendage. The foliage in the Southern and Pacific States, lives through the winter.

It likes a light soil, well mixed with decayed manure: when coming in bloom it should have plenty of water. The root should not be divided oftener than every three years.

EXCHANGE.

As the RURAL seems to be a medium for the exchange of flower seeds, I would like to avail myself of the opportunity to exchange those that I have in superabundance for others I am short of. I have: Flowering Almonds; Straw-colored Lily very fragrant; Peony, Perennial Phlox; Oxalis, common pink, and white; Bowiea, pink and yellow; Gladiolus seed. I would like to exchange these for Pansy and Aster seeds, Compton's Centennial Prize Field Corn, or Prof. MURDOCH'S Yellow; 100 Days' Tomatoes, Lily bulbs, except Tiger; Pinks or any colored Campanula, except white. M. M. W

Box 35, Pittsfield, Mass.

I HAVE the Early Ohio, Snowflake, Victor, Burbank's Seedling, Genesee Co. King, White Victor, Ruby, Acme, and other new and choice varieties of Potatoes, a few of either or all of which I would like to exchange for other new varieties such as the Leader, Superior, Compton's Surprise, Dunmore, Climax, Centennial, Triumph &c.

I also have a considerble quantity of Flower Seeds, several choice varieties, a few of which I will agree to send to any reader of the RURAL sending me a post-paid and adressed envelope, as long as the supply lasts.

Windham, Ohio. CLINT HIGLEY.

NOTE.—We apologize to our friends that for want of space we have been unable to publish the "Exchange" propositions received during the past month. Indeed, we have received ten this year where last year we received one. We shall publish all that we have space for. [EDS.

FENZLIA DIANTHIFLORA.

ON p. 168 of the RURAL, MRS. COX refers to this plant. Judging from her notice I presume her plant is Gilia dianthoides, a beautiful little Californian annual that bears a profusion of delicate, rosy-tinted flowers with a yellow throat surrounded by five dark-colored dots. The tree Fenzlias are Melastomaceous shrubs and natives of tropical New Holland. The above Gilia is, nevertheless, often grown and distributed under the name of Fenzlia, an appellation to which it has no right whatever. W. F.

Miscellaneous.

MATERIALS FOR MULCHING.

PROFESSOR W. J. BEAL.

MULCH is placed about plants to prevent the sun from evaporating the moisture. In many cases it takes the place of cultivation. No doubt, if it were not for the expense and trouble, it would be more extensively used about herbaceous plants. We have found, in our trying climate, that a fine mulch of manure completely covering the ground is an excellent thing for bedding plants. With trees and shrubs, a serious objection to the use of mulch is its liability to harbor mice which may injure or destroy the plants. For strawberries mulch is used to keep the fruit clean as it ripens and to protect the plants in winter and spring. For strawberries we have had the best success in applying the mulch quite late in autumn and in leaving the materials thin enough over the plants to barely expose a few of the leaves. The more changeable and severe the seasons, the greater the need of mulch—and mulch in generous quantity. There is a great variety of materials employed for mulching. I have heard of the use of beach sand or fine gravel with excellent results. The inexperienced gardener can try old clover hay, as I have done, and get a good crop of thrifty young clover to kill out the next spring; or he can employ ripe timothy or June-grass, and soon find the ground seeded with a crop he was not prepared for. Or again, if he like better, in the spring he can mulch with oat-straw not half thrashed or full of chaff containing oats still plenty. Then he can dig young oat-plants all summer among the strawberries. Digging out the young plants of clover, grasses, oats, etc., is healthful exercise and stirring the soil will not hurt the strawberry plants.

I once tried all the above methods. I also tried forest leaves for autumn mulch adding corn-stalks to hold them down and thought I had a good thing. In spring, after an open windy winter, the leaves were not to be found. A few at a time, they had blown away. Having tried all these to my satisfaction, I now prefer clean straw, old or new, or marsh hay or corn fodder cut two inches long less or more. Pine-shavings get into the soil and are a nuisance. The same objection may be urged against tan-bark or any other material which does not decay readily and help to enrich the soil.

Agricultural College, Lansing, Mich.

TEXAS AS AN INVALID RESORT.

IN penning you this letter I do not propose to write up Texas and to encourage hither immigration, "by painting an Arcadian scene." That is being done already by railroad and land agents and parties having lands for sale and by others who desire to see the resources of the State speedily and fully developed. My object is to call the attention of those of your patrons who have weak lungs and with whom cold and rigorous winters do not agree, to the fact that the climate of Texas will prove a balm to them. I speak from my own experience and from the testimony of hundreds who, like me, have made Texas a home, not from choice, but necessity. For I can assure you I came to this State with many misgivings as to its people, its insects, its reptiles and the heat of its summer. In all these apprehensions, however, I have been most agreeably disappointed, and must state that Texas is a goodly land—but it is to a great extent undeveloped.

Seven years ago I left New York; took the advice of HORACE GREELEY and went West to "grow up with the country." Kansas City was my objective point. But one winter there satisfied me I had gained nothing by the change. From parties from Texas I learned that all my misgivings had no foundation in fact, and that if I would go to Texas, especially to the western part, I would immediately realize a change for the better, and soon would become hale, hearty, and sound of lungs. Concluding that such might be the result, I set out for Dallas in May in 1872. Then I bought a pony and equipments and began to travel over the State. I have been more or less over all of Northern, Southern and Western Texas.

When I came here I only weighed 125 pounds, I hardly cared to live. I now weigh 165 pounds, am free of cough and strictures in the breast and feel and am able to do any kiuk of work, or to undergo any kind of hardships. I have found and met hundreds from the Western and Northern States who attest the same experience. I know thousands (?) in the Northern and Western States—men and women—with whom the winters do not agree and never will. All such I can safely and conscientiously advise to come to Texas. JOHN MORRISON.

Colorado Co., Texas.

IRRIGATION.

AT the annual meeting of the Western New York Horticultural Society, the undersigned were appointed a committee to investigate the subject of irrigation and report at the meeting to be held in January next. The committee, desiring to embody in their report the results of actual experience, request persons having practical knowledge of the subject to communicate to the chairman of the committee such facts as they may be able, in regard to the methods, cost, difficulties, profits &c. of irrigation; and the committee will endeavor to send a copy of their report, when pulished, to those who comply with this request. If those who are situated so that they can make accurate experiments during the present season will send their address to the committee, blanks will be furnished them to fill out.

Committee.—S. Reed, Scottsville, N. Y., C. H. Dann, Warsaw, N. Y., W. R. Lazenby, Ithaca, N. Y.

PINUS AYACAHUITE.

IN the RURAL of Feb. 2d. we notice that Messrs. ELWANGER and BARRY condemn the Pinus Ayacahuite as quite unreliable for hardiness, while Mr. C. S. SARGENT, in the RURAL of March 16th, considers it unsuited to any climate north of Georgia.

Now, of course, we do not wish to question the result of these gentlemen's experience and investigation, and there is certainly much reason for this belief independent of actual experience, in the fact that the Pinus Ayacahuite comes from the mountainous regions of Mexico, where all other native pines are ill suited to our climate. Nevertheless the opinion expressed quite astonishes us for we have grown this pine with success for twenty-five years and sold it throughout the country without any complaints coming in of a character to make us doubt its hardiness. In view, however, of the opinions referred to, it would be interesting to hear further evidence in the case from different sections of the country. Many explanations of this behavior might be offered with considerable show of reason, but, after all, hardiness must be for nearly all plants a relative term, as scarcely any adapt themselves to all the peculiarities of our climate.

SAMUEL PARSONS.

[This is rather a contradictory case. We would be glad to hear from any who has tested it. For ourselves, we have never seen a plant out of our own grounds, and this we have had but a short time.—EDS.]

RAW BEET SUGAR.—We have received from D. W. PAYNE, Corning N. Y. a sample of this sugar which presents a fine grain, and ought to yield a superior product when clarified. This industry should be stimulated. It has almost driven cane sugar out of use in France, and is one of the leading sources of wealth of the nation. We congratulate MR. PAYNE.

CATALOGUES, &c., RECEIVED.

H. M. THOMPSON & SON, St. Francis Nurseries. Illustrated Wholesale Price-list of Nursery-grown European Larch, Evergreens, Fruit, Ornamental, Shade, and deciduous tree seedlings, St. Francis, Wisconsin.

Fourth Annual Report of the Commissioner of Agriculture of the State of Georgia, for 1877.

KANSAS AS IT IS. A complete review of the resources, advantages, and drawbacks of the great central State, by L. D. BURCH. Published by C. S. BURCH & Co., 164 Randolph Street, Chicago, Ill. An interesting and well illustrated work of 145 pages.

THE SUGAR BEET in North Carolina. Report to the Commissioner of Agriculture on the results of experiments with the Sugar Beet in ten counties, by ALBERT R. LEDOUX, Ph. D., Chapel Hill, N. C.

CROSSMAN BROTHERS' Illustrated Catalogue and Guide to the flower and vegetable garden for 1878—72 pages. This contains all necessary information. The firm invites a comparison of prices with those of any other responsible house. It is furnished free to all applicants.

REPORT of the Directors of the Central Park Menagaric for 1877.

A. WHITCOMB'S Descriptive Catalogue of new and popular bedding and greenhouse plants, Lawrence, Kansas. A neat little pocket-book of 16 pages.

WILLIAM H. DYER, Mulberry Grove, Providence, R. I. Catalogue and Price-list of trees, shrubs, flowering plants, &c. 8 pages.

SOME REASONS FOR TILLAGE, as based on the relations of water to soils and to crops, by Professor S. W. JOHNSON, published by the Case, Lockwood and Brainard Co., Hartford, Conn. This neat little pamphlet of 28 pages contains a lecture by Prof. JOHNSON delivered at the Convention of the Board of Agriculture at New London, Conn., Dec. 13, 1877. Probably no man in this country, and few elsewhere, have contributed so largely towards popularizing agricultural science and intelligent practice as the author who in this little work has condensed the instructive results of numerous experiments, extensive studies and much reflection.

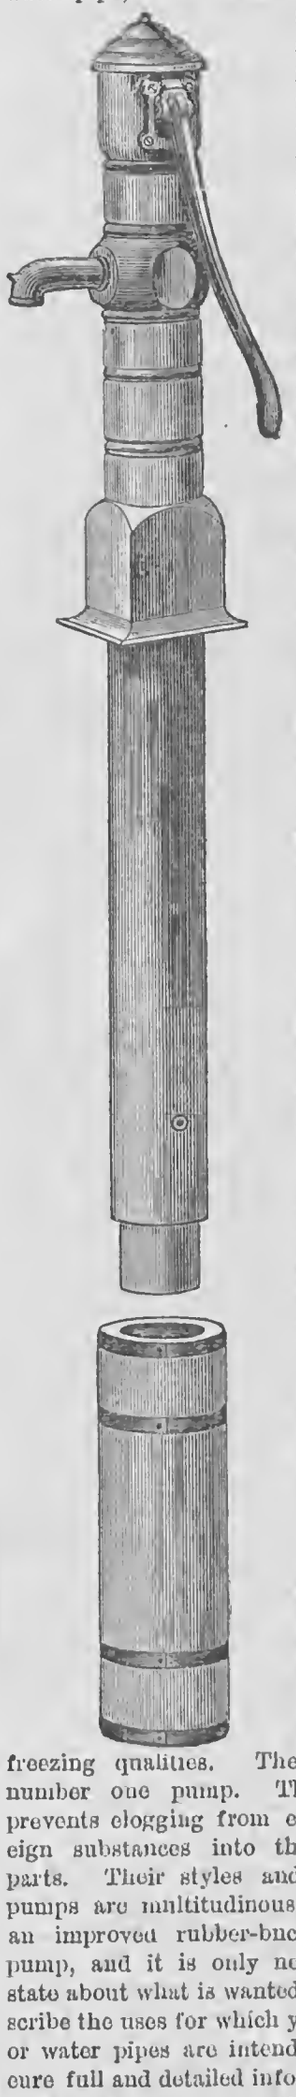
FOREIGN CATALOGUES.

CHARLES TURNER, the Royal Nurseries, Slough, England. Catalogue of Greenhouse and Bedding plants.

Industrial Implements.

THE BABCOCK PUMP.

NUMEROUS inquiries have been received of late concerning the adaptability of wooden water-pipe, and its relative cheapness; we now take occasion to say something regarding its manufacture and to present an illustration of an improved pump. We are indebted for our information to Messrs. H. H. BABCOCK & SONS, Watertown, N. Y., whose experience in the manufacture of these articles, extending over a period of thirty-three years, gives value to their suggestions.



They consider the Michigan white pine the choicest material for these purposes, and when selected and treated with care it will withstand destruction for a great length of time, ranging from ten to twenty years according to circumstances. This firm manufacture their material from the green wood, and then allow it to season from twelve to eighteen months. The work is then carefully inspected and imperfect wood rejected before the final completed product is offered for sale. This practice insures sound, flawless wood. The water pipe is of from one to four inch bore, and is used to good advantage in creameries, factories, and for farm purposes, especially for the use of stock where it is desirable to have a flow of pure, untainted water.

The pumps made by this house have gained an enduring reputation because of the excellence of their manufacture, their good suction and non-freezing qualities. The illustration is the number one pump. The patent iron cap prevents clogging from casting foreign substances into the working parts. Their styles and sizes of pumps are multitudinous including an improved rubber-bucket chain pump, and it is only necessary to state about what is wanted, or to describe the uses for which your pumps or water pipes are intended to secure full and detailed information of a practical character. We refer our readers who are interested in the subject to this house, feeling sure they will receive the most courteous attention.

THE CHAMPION PAN.

THE work of the dairy has been so improved and simplified by novel appliances that the old, tedious methods are fast becoming mere traditions. This is especially true of milk pans. The weary method of lifting pans to and from shelves, entailing great waste, and uncounted back-aches is relegated to the limbo that contains the *debris* of many other antiquated processes. By the use of stationary pans there has ensued a saving of labor, a larger yield of butter which is of better quality, and hence an increase in the

value of the product. These alone are cogent reasons for the success of the system. Small as well as large dairies are gainers by the use of the most approved implements; in fact, to keep pace with the demand for a high-class article their use becomes a matter of necessity.

It is said that "paper is made in the engine;" that is on the careful preparation of the stock and pulp depends the quality of the product; so may it be affirmed that butter is made in the pan, as on the neat, cleanly and successful treatment of the milk while the cream is rising, will the quality of the butter be decided.

The "Champion" milk-pan, made by WILLARD & HAMMOND, Randolph, N. Y., is deserving of taking high rank as a simple, effective and not costly apparatus that has stood the test of practical work, and received the official approval of judges capable of discriminating between the practicable and impracticable.

The chief features of this pan consist in the arrangement of four single pans within one large water pan divided into four compartments. The circulation of water may be controlled so as to move freely about one, or all of the pans at the convenience of the operator. These pans are firmly set in a wooden frame, and the character of the materials employed in their construction, and the construction itself leave nothing to be improved upon. The device for the management of the water is ingenious, and secures an equable temperature, while the construction of the pans permits of deep or shallow setting.

Space forbids an extended mention, but what has been said sufficiently indicates the value of the "Champion," and those who take a pride in thoroughness in the dairy can secure details by writing to the firm above mentioned for completer information.

PLAN FOR A CIDER MILL.

GEO. B. BOOMER.

CIDER making, like most other industries, is rapidly changing. Instead of the small mills scattered about the country for the convenience of farmers, we now find them built on a larger scale, located within easy reach of the great lines of transportation, and owned by energetic business men who ship the "juice," as fast as made to dealers in the large cities; or manufacture it into refined cider, jelly, and vinegar on the premises.

That this system must eventually crowd out the small mills, seems quite as reasonable as that the choose factory should gain the ascendency it has in that branch of farm business.

The plan herein submitted comprises a mill capable of making a car-load of cider in a day, that it may be sent to its destination before fermentation takes place.

In the ground plan, Fig. 3, A, is the press room, 28 by 36 feet, and 12 feet high. The boiler room on the side is 10 by 20 feet, and contains the six horse-power boiler, B. The engine E, is connected by belt with the line shaft in the second story. The power press P, including double platform, requires a space 8 by 10 feet, leaving 6 feet between it and the side of the building occupied by the railroad track, T, upon which runs a car to carry off the refuse pomace. The grater G, is placed 7 feet from the press, and about 8 feet above the floor. A shute connects it with the apple hopper which occupies a space 14 feet square on the floor directly above. M. M. is an iron track ½ by 3 feet suspended from the joists above, and extending from either side of the grater, around to, and joining over the middle of each cheese.

Two tubs, each 30 feet in diameter, and 30 feet deep, are suspended from this track. The grater is provided with a tilting shute, and the whole arranged so that while one tub is being filled, the other is run to the press, dumped, and returned to its place ready to receive the pomace when its mate is filled. The weight of the tub when filled is made to tilt the shute, thus accurately weighing the pomace for each layer.

No apples are stored in the building, but in the bins, O. O. outside. These bins are 12 feet long, 3 feet 2 inches wide, and 4 feet 2 inches high, each holding just 100 bushels, or two bushels per inch in depth. Two rows of these are placed one foot apart. The belt carrier runs between them, beneath the floor, to carry the apples into the mill, and discharge them into the hopper on the upper floor.

A wagon road extends around the outer ends of the bins. As each customer arrives, he is directed to a bin, unloads his apples, levels them, and by marks in the corners, reads the depth of apples in inches, which doubled, gives the number of bushels. If the boards forming the partitions of bins are sawed just 10 inches wide it will facilitate the measurement.

The cellar 25 by 33 feet contains six tanks of 3000 gallons capacity each, and the second floor two of the same size. A tank is also sunk four feet below the cellar bottom, from which a power pump, with fifty feet of inch hose, throws the cider to any part of the building.

The line shaft two inches in diameter making 250 revolutions per minute, is located 8 feet above the upper floor and 16 feet from the rear of the mill. It is sometimes economy to rent power in the neighborhood of a cider mill, in which case it is safe to transmit it 1000 yards with a wire rope ⅝ of an inch diameter.

In operating this mill but two men are required. They commence in the morning by laying the first cheese, which takes from 20 to 30 minutes. While that is pressing they lay the second, and have nearly an hour to spare, during which one elevates apples, while the other looks after the press, cider &c.

A cheese contains ten layers of 8 to 10 bushels each. It requires from sixty to ninety minutes to press it. The yield should be four gallons per bushel of 50 pounds. From 7 to 10 pressings are made in 10 hours, not including the dinner hour which may be partially utilized in pressing.

The cost of erecting a mill of this kind will not vary much from the following figures:

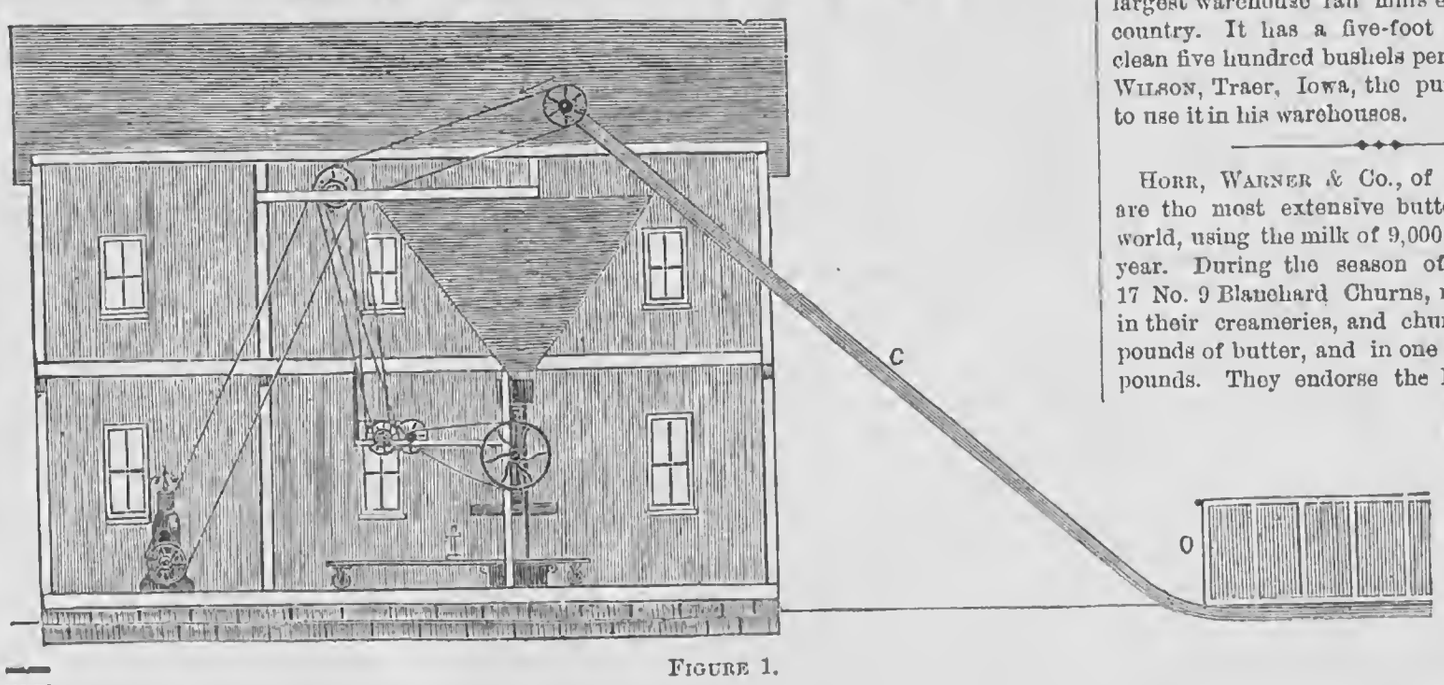


FIGURE 1.

Building, including apple bins	$500
Engine and Boiler	600
Press, with cloths, racks &c.	525
Grater	60
Elevator	100
Shafting, belts, pullies, &c.	100
Tanks	300
Pomace tubs, and elevated track	100
Pomace truck and track	25
Pump, Hose, &c.	50
Total	$2,360

To a cider-maker of the old school this may seem like a large outlay; and compared with the old nut mill, and wooden screw it is: so is the mowing machine compared with the scythe; the reaper with the cradle; or, the modern separator with the flail; but people who make money use them, and it will generally be found that those who are alive to modern improvements are the men who succeed.

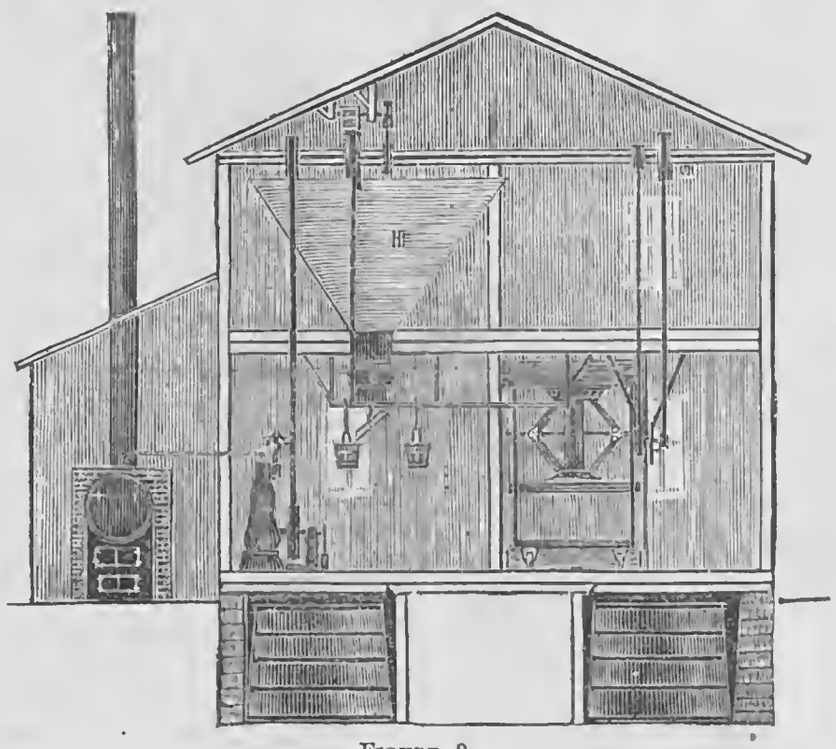

FIGURE 2.

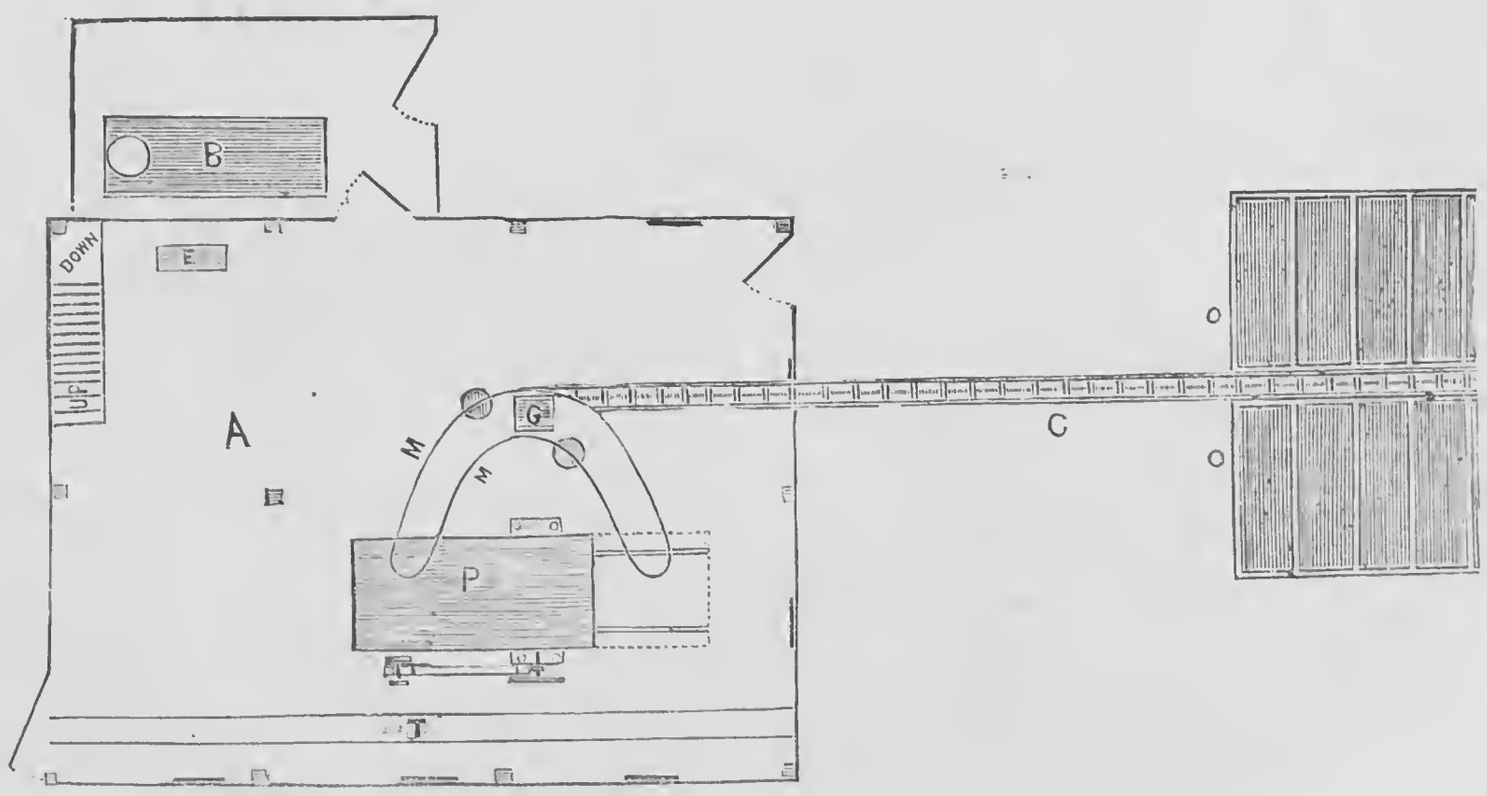

FIGURE 3.

THE United States Wind Engine and Pump Co., have sent to the Paris Exposition a twelve foot Halladay Standard Wind Mill finished off in the American colors. This Company have just shipped to Cuba a forty foot (18 horse) mill for grinding sugar cane and are now completing a sixty foot (40 horse) for the same market.

A. P. DICKEY the pioneer of fanning-mill manufacture, has just completed one of the largest warehouse fan mills ever made in this country. It has a five-foot hurdle, and can clean five hundred bushels per hour. Mr. WEST WILSON, Traer, Iowa, the purchaser, proposes to use it in his warehouses.

HORR, WARNER & Co., of Wellington, Ohio, are the most extensive butter makers in the world, using the milk of 9,000 cows the present year. During the season of 1877, they used 17 No. 9 Blanchard Churns, made in this city, in their creameries, and churned over 400,000 pounds of butter, and in one churn over 39,000 pounds. They endorse the Blanchard Factory Churn as the best they have used or seen in operation. —*Independent Statesman, Concord, N. H.*

THE Cortland wagon is deservedly popular.

WHAT THEY SAY OF IT.

FIFTH WEEK.

EDITOR RURAL:—The "Cricket ock was received all right. Are well pleased with it, and thank you for so nice a premium. J. B. B.
Miller's Station, April 6, 1878.

WE received the clock all right, and are much pleased with it. It keeps excellent time and is a handsome ornament. We thank you for it.
Waterville, N. Y., April 1, '78. A. W.

I HAVE had my "Cricket" for over a week and I am very much pleased with it. It is just what I wanted, and it keeps good time. J. R. B.
Tilsonburg, Ont., March 23, 1878.

I HEREWITH send subscription and inclosure for "Cricket Clock." My brother received his clock last Saturday and thinks it splendid, so my little girl must have a "Cricket" too. T. M.
Porter's Mills, Wis., March 28, '78.

WE have received several premiums from the RURAL and from other papers—but never before one that was worth as much as it was set forth to be worth. The "Cricket" is worth more.
Paterson, N. J. A. S. P.

THE Cricket Clock is quite different from any other I have ever seen. It combines, as you say, the clock and watch—is a pretty ornament, and best of all, keeps almost perfect time. I have never had a clock or watch to keep better.
Youngstown, Ohio. J. B. C.

"CRICKET" received. Very well pleased. As we did not need it, I talked of selling it, but my daughter said that if I talked that way she would hide it, which, by the way, would be rather hard to do, if it was kept wound, as it is very noisy for so small a fellow. MRS. C. M. R.
March 28, 1878.

WE are all delighted with the "Cricket." I wound it up when I got it home, and set it by the side of my clock, and the latter quit running right off. I reckon it got insulted at the little "Kicket" as my little Willie and Kate call it. The children are perfectly carried away with it. My wife joins me in many thanks to you for the "Cricket." W. T. T.
Salisbury, N. C., March 30.

THIS morning the "Cricket" came in all right. I have set it a-going and it goes nicely. I am very much pleased with it. It looks much better than I expected, and makes quite an ornament for my sitting-room shelf. My family are very much pleased with it.
ALEX. Mc W.
Thornton's Ferry, N. H.

THE "Cricket" came by express in due time, and I am very much pleased with it. It is a handsome little clock, and then it keeps such correct time, that it is at once a great favorite in my school-room. I also think a great deal of the RURAL, and believe it to be one of the best—of the *very* best of its kind published. L. S.
Pattenburg, N. J., April 1.

The Querist.

ANSWERS TO CORRESPONDENTS.

Water Sprouts for Grafting.

T. W. C., Jackson, Susq. Co., Pa., inquires whether cions cut from water sprouts, or sprouts that make out from the branches or trunk of a tree where it has been trimmed the year before, come into bearing as soon as cions taken from the ends of the branches.

ANS.—Yes. If well matured and sound, the water sprouts will produce branches or tops which will bear as soon as the new growth of the graft is large enough to bear, or as soon as it should be allowed to bear. The earliness of bearing of cions depends on several things: the varieties selected, the rapidity of growth, care of the tree, soil, etc., etc.

Starting Grape Cuttings.

Mrs. A. C. H., Roanoke, Ind., says:—Will the RURAL please tell me how to start grape cuttings; when and how to cut and plant them; and what care and treatment they will require.

ANS.—The best time to make the cuttings is in the fall or a little earlier than now for your climate and to plant them about the 1st of April. Prepare a bed a foot in depth of rich sandy soil. It cannot be too rich. If manure is used, it must be entirely decomposed or, in other words, it must have become soil. The cuttings may have three or four buds, and had better be close-jointed. A heel of two-year-old wood may be cut out or a small section of it left when it is called a mallot cutting. Place these inclining a little in the bed so that one or two eyes are left above ground, and pack the earth firmly about them. Until frosty nights have passed, it is well to cover lightly with hay or straw. Plant the cuttings six inches apart in rows—the rows a foot apart. Allow but one bud to push.

Blood as a Fertilizer.

C. F. Graham, Hamilton Co., Ohio, inquires what is the value of blood as a fertilizer, to what crops should it preferably be applied, and in what manner.

ANS.—The value of blood as a fertilizer depends on the nitrogen it contains. Of fresh blood about 80 per cent. is water. A gallon of it weighs not far from eight pounds and contains 1.6 pound of dry matter of which 15 per cent. is nitrogen. Four gallons therefore contain about a pound of nitrogen, which in this form is worth fully 18 cents, and that is accordingly very close to the manurial value in cash of four gallons of fresh blood. Its free application to corn, root crops etc., as well as to all garden crops will prove highly beneficial. Mix it with dry muck or mold, say at the rate of a gallon to a peck, or even more liberally. The composition of air-dry blood and flesh is almost identical, the former containing about five per cent. more water.

About Sundry Plants.

Jno. J. W., Jamestown, R. I.—I would like to avail myself of the benefit of the RURAL'S Answers to Correspondents. I subscribed for it at the commencement of the present year. Since then I have sent for a number of catalogues advertised therein, and from five of the firms they represent have ordered either seeds or plants from $1 upwards. From B. A. ELLIOT of Pittsburg, and the DINGEE & CONARD Co. I have received my orders—nice plants with liberal extras. From Mr. JOHN SAUL of Washington, I have ordered over 600 trees—grape-vines, rose bushes, shrubs and green-house plants, and it is in reference to some of these I ask for information: 1st. Are Chinese Arbor-Vitæ hardy where the thermometer is liable to fall ten degrees below zero? 2d. Are Magnolia grandiflora and tripetala hardy in the same climate and how large trees do they make? 3d. How large does the Kilmarnock Willow grow? 4th. Is the Wistaria surer to live in the shade? I have some, twenty-five feet high, that bloom well on the north side of large Norway Spruce and on the west of Austrian Pine where they get no sun until late in the afternoon, while I have failed three times with those set south of my piazza. 5th. Will Azalea amœna which is marked hardy in the catalogues, stand the above-named cold? 6th. I expect to receive my order from Mr. SAUL by the 10th of April of which there is to be quite a lot of Tea, Hybrid-perpetual Roses and Zonale Geraniums, will it do to plant any or all of them out at that time, if they are covered with boxes by night? Or would it be best to grow them in pots and boxes a few weeks? By answering these questions you will confer a favor on one and I doubt not on many subscribers.

ANS.—1st. Yes, if by Chinese Arbor-Vitæ Biota orientalis is meant. Varieties of this (Aurea c. g.) are harmed occasionally in this climate.

2d. Magnolia grandiflora is not hardy even in the Middle States. M. tripetala will stand ten degrees below zero. The first is a large, the second a low tree.

3d. We presume the weeping variety of Salix caprea is referred to. It is usually grafted on stock of the species and grows downward in the form of an umbrella. Its hight, therefore, depends upon the hight of the stock.

4th. The Wistaria suffers less in the winter if shaded.

5th. Azalea amœna is not hardy in the Rural Grounds.

6th. We should prefer to wait until danger of severe frost is passed before putting out the Pelargoniums.

Hedge Plants.

Two years ago I bought hedge plants (Honey Locust) and set them out along the road ten inches apart. They grew finely and I did not lose a single plant. Last spring, the first of April, I cut them back, leaving only about three inches of the last year's growth. Last summer they grew splendidly, some shoots growing four feet long. To-day, March 29th, I have cut them back again, leaving about ten inches of last season's growth. In two years more I expect to have a hedge that will turn any kind of stock. I would advise J. N. WILLIAMS, of Crawford Co. Pa., whose letter appeared in RURAL for March 30th, to buy or raise Honey Locust plants in preference to Osage Orange. They are hardier, will grow faster, will make a better hedge and do not have to be set so close together: ten inches is quite close enough. I would advise any one setting out any kind of hedge to sort their plants, keeping the large ones together and the small ones together. If a small plant is set between two large ones it will be so shaded that it will not do well. HEDGER & DITCHER.

Crawford Co., Pa.

Applying Gypsum and Lime.

T. L. E, York Co., Pa. wishes to learn the best way of applying gypsum and also lime, and the average quantity of the latter that should be used.

ANS.—Sow gypsum early in the morning while the dew is on the ground and there is no wind. It may be mixed with muck.

Spread lime from small heaps with a shovel or from the tail of a cart. The amount may vary from the least quantity that can be spread evenly to from 300 to 500 bushels per acre. The nature of the soil must determine this point. Heavy lands of a moist or mucky character or those dark from vegetable mold will bear much more than light soils: from 50 to 100 bushels is an ordinary application. To apply small quantities it is best to mix the lime with muck or soil, especially in garden culture. Always remember that the effects of lime on soil are the same as those it produces in the compost heap.

Unhealthy Cyclamen.

Mrs. C. McC., wishes to be told what is the matter with her Cyclamen. It is now considerably older than four years, has had its soil changed every fall, and received the same loving care bestowed on her other floral pets, yet the ingrate is always dormant or nearly so, seldom gladdens her eyes in summer with more than a single leaf or happily two once in a while; and even when placed in a sunny window, as cold approaches, its only signs of gratitude are a few long-stemmed, scraggy-looking leaves with never a blossom to give promise of a possible offspring more healthy and grateful than its progenitor.

ANS.—From now till the first of June keep it moderately dry, then turn it out of its pot, shake away most of the old soil, and plant out in a somewhat shady part of the garden, in free open soil, burying the corm ("bulb") nearly an inch. About the middle of next September lift it carefully and put it into as small a pot as you can get it into without cramping the roots, this time keeping the corm at the surface, and using a very free soil, say with a considerable admixture of sand and old leaf-soil or much decayed cow-manure. Keep shady for a day or two, expose gradually, and before the advent of frost, promote to a sunny place inside the window. Never give very much water, just keep moderately moist.

Dead Animals as Manure.

H. C. L., Herkimer Co., N. Y., wants to know a good way of using dead horses and other defunct animals for manure.

ANS.—A good way is to cover the carcasses with dry muck or rich soil, let them lie for a few months and work the mass over well when sufficiently decomposed to admit of ready fermentation, adding plenty of plaster. Use the compost liberally where needed. See answer to C. F. Graham for plants most benefited by the application.

Miscellaneous.

H. G. Touissant, Paraje, N. M., says 1. Where can I get a strong mowing machine, to cut Gama-grass, one for a two-horse machine, and I am ambitious to own the best in the market, and am surprised that none is advertised in the RURAL. 2. Where can I get Canary birds; 3. Name of some cage-maker; 4. When does my subscription run out.

ANS.—Write to the Warrior Mower Co., Little Falls, N. Y.; Aultman, Miller & Co., Canton, O.; Bradley Mfg. Co., Syracuse, N. Y.; Eureka Mower Co., Towanda, Pa., and the Johnston Harvester Co., Brockport, N. Y. These firms make excellent machines, and their circulars will give you the points of difference. It is not quite the season for advertisements of Mowers to appear. 2. Any bird fancier in New York city (of whom there are numbers), will supply Canaries. This is the chief importing point. 3. Lindemann & Co., 254 Pearl St., N. Y. 4. June 1st, No. 1476.

A Subscriber inquires whether the Sherman Telegraph Co. of Oberlin, Ohio, is a reliable institution.

ANS.—There has been a change in the management of the institution, and we know nothing about its trustworthiness.

Mrs. D. S. M., New Haven Co., Ct.—We acknowledge all communications, whether published or not.

T. C. D. Detreville, Va.—Where can I get a small metal check to be used in the canning business: to pay by the piece—something that cannot be imitated, but very cheap?

ANS.—We should think that the best thing for your purpose would be a piece of tin of irregular shape, stamped with a peculiar device. You could cut the tin to suit your fancy, or have a stamp made to do the work with precision. A die-sinker will supply the device. We advise you to write to the following addresses, stating your want: H. Wasdell, 193 William St., F. B. Smith & Horst, 95 Fulton St. and Kinsey & Co., 143 Fulton St., New York.

D. M., Pittsfield, Ill.—Having seen an extract from the RURAL relating to the evergreen White Thorn—Cratægus Pyracantha—wishes to learn where he can get some.

ANS.—Ellwanger & Barry, Rochester, N. Y.; S. B. Parsons, Flushing, Long Island.

E. C. Stebbins, Hempstead, L. I.—"New Rochelle" Raspberry is, we believe, a seedling of Catawissa. Mr. CARPENTER advertises it in our columns. There are several excellent reports of it from good men. It has not fruited with us.

COMMUNICATIONS RECEIVED FOR THE WEEK ENDING SATURDAY, APRIL, 6TH.

Everywhere.

NOTES FROM NORTH CAROLINA.

ALTHOUGH there has been some very severe weather in the western part of our State, the winter has been very mild in the central portion. Here we have had but few really wintry days. But it has not been so warm as the winter of 1875 and '76. Then I remember to have fed green rye on one of the last days of January. This year, I began to cut and feed to my cows on the 9th of March.

About the 11th instant the peach trees began regularly to bloom, and in a day or two they were arrayed in full colors. I do not remember ever to have witnessed so sudden an appearance of blooms. They sprang forth as by magic. The Plums, Cherries and Apricots are also adventurous enough to be equally exposed. We fear that the frosts or the northeast winds will blight them. For several days we have experienced a cool change, but the weather has moderated considerably, and we are in good hope. I can recall one year when the fruit was not injured, although the Peaches were in bloom in February. The Apples are backward, not a tree yet showing a single open flower. They are just beginning, generally, to show their first buds.

Noticing some of the trees that are indigenous to Asia, I have the opinion that they are rather peculiar in that they show their buds and blooms more in advance of the leaves than many, at least, native to other lands. It is true of the Peach, partially so of the Pyrus Japonica, also of the China Tree, if I remember correctly. Does it apply to other varieties which you have observed?

Spring seems to have opened now. In addition to the fruit trees, the Red-bud decks the forest, Hepatica has been blooming for some time, the wild Violets are beginning to open, the yellow Jonquil has bloomed and is fading, a species of Syringa in my yard is covered with white flowers, and a modest Lily is spreading itself to the sun. The clover and grass are rapidly growing. A piece of rye on my lot confirms me in the view that every farmer ought, in autumn, to seed at least a small quantity for early feed. Mine was tall enough to cut well on the 9th of March. Now it is beginning to head. The cattle are very fond of it, and it is certainly a contributor to the milk-pail. It is really a pleasant sight to see the cows feasting so early upon the succulent stems and blades, after being so long restricted to cured provender. They appear to be quite as fond of it as of clover. I do not know whether your colder winters would suit it; but I *do* know, from repeated experiments, that it is a most desirable help here. It can be cut several times. It comes just in time to introduce the green feeding and bridge the way to the clover. I think that any one who tries it once will be encouraged to repeat the experiment. I do not allow even a calf to graze upon it, at any time. When I need the ground for other crops, I have, in the stubble and the roots, a good deal of fertilizing material, that tends to make the soil lighter or looser. Last year, after cutting off the rye, getting more than one stand, I also raised corn and then peas on the same ground. I know that tends to rapidly impoverish the soil, but I also know that the soil should be regarded as a machine to take, as often as possible, the raw material in manures and convert it into that which is suited to our wants. Debts cannot be too heavy or expenditures hurtful, if plenty of money is furnished. So the exaction upon the soil cannot be too heavy, if plenty of manure is added by way of compensation.

There is quite an increase, I think, in the demand for clover and grass seed. A druggist in our place who, two years ago, sold but two bushels of clover seed and but little orchard grass, has already disposed of several times the quantity of the former,—and after selling twelve bushels of the grass seed, has ordered more. The grasses in demand here are timothy, herd's-grass and orchard grass. The last is the favorite for mixing with clover. It holds it up in the field and renders it more easy to cure safely. There is also, I think, an increased demand upon the nurserymen for fruit trees. I have indulged, with much pleasure, in amateur grafting, of which I may report before long.

Our State Chemist having made an unfavorable report upon the Poplein fertilizer, the firm have furnished him a quantity of their brand for careful experiments by the side of popular compounds. Several intelligent and trustworthy farmers have taken a lot for this purpose; and I hope to give you the results. Perhaps some of your readers may not have thought of the convenience and value of a compost heap, as near the house as health and cleanliness will allow. By heaping the leaves from my shade trees on a poor spot, I formed the beginning of such a heap, and during nearly the whole year I threw upon it all the litter and waste that came to hand. During the winter I found that what I had not already applied made a fine top-dressing for the adjacent clover and grass. I have started it again. It helps to keep my premises clean. M.

Chapel Hill, N. C., March 19, 1878.

RURAL SPECIAL REPORTS.

CORNING, N. Y. March 23.

LIKE J. W. S. of North Carolina, I am much interested in "Everywhere," and think that a few notes from this locality will not be out of place. We are having a very fine time to forward spring's work. Roads are getting dried off, some fields are being plowed and some farmers have sowed timothy and clover seed; and all, or nearly all, are preparing for active service. Of course we have some farmers, just as all other places have, who "take no thought of the morrow," and, consequently are always behind time. We can boast of a very fine locality for farming. Our river flats, on the Chemung, are very fertile, and produce large crops of wheat, corn, tobacco, etc. Less attention is given to the vile weed and more to wheat raising than a few years ago; and if tobacco were abandoned and wheat and corn should take its place entirely, a far more useful production would be the result. As to the land on the hills three or four miles back from the river, it is also very productive; and with the same amount of capital invested per acre, as on the river, I do not doubt but as good returns can be received; and, to my idea, the hill farm is to be preferred for a home, for I think it pleasanter; we also have there a better atmosphere and escape the fogs of the flats. On the hills can be had some fine views of the flats—their villages, farms, railroads, river, etc.

Apples, pears, cherries, grapes, and the smaller fruits, do well here. There are some large and very fine apple orchards around here, but as to the other fruits, they are not grown very extensively for market, although I see no reason why they should not be. Last year some of the pear trees were affected by blight. Those who did not dispose of their surplus

apples last fall, sold them this winter at one dollar per bushel, which is a paying figure and at that price I believe orcharding to pay as well as any other crop we can raise. Some farmers believe to the contrary, however, and take but little care of the orchard.

As to our facilities for shipping produce, they are first-c ass; for since the completion of the Syracuse, Geneva and Corning R. R., we can ship in any direction. This is now one of the best places for manufacturers to locate in, in this part of the State, considering our railroad connections with all points nor h, south, east or west; and we hope soon to see new business enterprises spring up in our vil.age. At present we have some very important manufacturing establishments, among which may be mentioned two engine and boiler works and foundries, railroad shops, glass-factory, monumental works etc.

For a year or more, business has been steadily improving until now it gives employment to many of those who have been standing around the streets with their hands in their pockets for three or four years, waiting for something to turn up. Of course we farmers hail these signs of better times with pleasure, for the more other business there is done, the more success to the farmer, for he can dispose of his surplus products more readily. Hence, we are inclined to look on the bright side, as regards the future, expecting some "greenbacks" for our labors.

F. H. D.

HARRIS CO., TEX., March 31, 1878.

ALL through the month of March we had uniformly calm and clear weather, with a day temperature of from 70° to 84°. Everything is growing and doing finely. Irish potatoes are blooming. I fairly believe we are for once rid of the Colorado beetle. Last year though they were in legions, still the damage they did was reduced to a minimum, for while the winged insects deposited their eggs freely, there were hardly any larvæ to be seen. It could not have escaped the attention of an observer that at the same time multitudes of small, yellowish-green beetles spotted with black, would swarm about the potato plants diligently and busily searching them, leaf after leaf, from top to base. No sooner did the eggs of the Ten-liners hatch than the young larvæ fell a prey to these little cannibals. And very effectually must they have done their work, since, up to the present not a single specimen of the potato-beetle can be detected, while at other seasons they used to commence to make their appearance as early as the first part of February.

Roses form now-a-days the chief attraction of flower gardens. All the so-called tender varieties, are perfectly hardy here. Nobody that has never seen them growing in a climate congenial to them, has any conception of the gorgeous display in colors, forms, and quantities of flowers they are capable of exhibiting. A well trellised Marechal Niel, Solfaterre, Chromatella, or in fact any other Noisette Rose, covered with hundreds, nay, thousands of white, red, or golden balls, is a pleasurable sight. G. MARTI.

ELDORADO, March 23.

IT is raining again to-day. We have had seven or eight days of fine weather, and you may be certain the most was made of it, trimming grape-vines, pruning trees, grafting good varieties on poor, and such work has kept all busy. Peach, pear and apple trees are in full bloom, and a rich harvest is promised. Strawberries are white with bloom. In the flower garden everything is thriving. Among my Daisies I notice a very deep crimson, the flowers are very full, the petals are very full and quilled, not a flat petal being in the bloom; it is the deepest red I have ever seen among Daisies. It is a seedling. My Bleeding Hearts stand two feet high and are loaded with flowers. I somewhere heard or read of a white variety, but do not know where now. Lilium candidums are finer than I ever had them before; they stand now fully two feet high. WM. C. L. D.

RAISIN CENTRE, Mich., March 30.

RAISIN CENRE is a small place, about five miles northeast of the city of Adrian. The country about here is level; the soil, a sandy loam. Corn is the main crop, although wheat, rye, etc., are raised in abundance. Fruit of every description grows here. Pork has been so low this year that some are nearly discouraged, while others have from 50 to 100 pigs growing for the early markets of next fall. We have had a very mild winter, the greatest depth of snow did not exceed six inches. Grass and winter wheat never looked better this time of year. Our garden was plowed the 7th of March, planted the 9th. Thermometer has stood as high as 82° a few days. Peach trees are in blossom, leaves are peeping forth, and everything betokens an early spring. W. M. F.

BROOKS, Maine, April 2.

THE past week has been one of a dreary, disagreeable overcast kind. The wind has been strong and cold and the traveling is very bad; the bottom has fallen out of the roads and been filled up with holes. Wild geese fly northward—a sign of early spring. The maple sugar season has been of only moderate returns. The best runs of sap were early in March. Stock doing well, especially cows, sheep, and hens. Eggs ten cents per dozen and hens have struck for a fairer lay. Veal calves from two to five dollars, more at former than at latter price. The mild winter makes hay plentiful, even though there was a short crop last year. This is an argument in favor of warm stabling. Potatoes fifteen to thirty cents per bushel. No demand for them.

T. W. L.

VOLINIA, Cass Co., Mich. March 23.

WE have in this place an excellent Farmers' Club and at a well-attended meeting held on Wednesday the 20th inst., the following resolution was passed unanimously:

Resolved, By the Volinia Farmers' Club that this society tender its thanks to Prof. Beal of the Agricultural College, for testing and reporting on vegetable and other seeds sent out by the various seedsmen; also to the agricultural journals that have had the independence to publish the same, and especially to the RURAL NEW-YORKER.

The Secretary was instructed to furnish a copy to each of the county press, and to send a copy to Prof. Beal. A RURAL ADMIRER.

ROYALTON, N. Y. March 30.

ALTHOUGH I have been engaged in selling stock for fifteen or twenty years, yet during that time I have never known milch cows to be in better demand than during this spring; ordinary good cows sell in this section for from forty to fifty dollars, and extra good ones higher. Good work horses are coming up every day; hogs and sheep sell well, so do almost all kinds of farming utensils. Wheat and grass look very promising. RURAL'S AGENT.

GREENWICH, N. Y., March 31.

THE potato beetles when plowed up lie in the sun a little while and are soon warmed into life. We are expecting a greater quantity than ever.

M.

HARVARD, Clay Co., Neb., March 24.

I CAME to this place from Wisconsin, and bought a farm. It is a very rich country and immigration is setting fast to this part of it.

E. A. K.

MEADVILLE, Pa., April 3d.

IT is warmer to-day and we have escaped the frost, so that fruit is still promising well here.

WM. H. K.

Entomological.

PUBLICATIONS RECEIVED.

ANNUAL REPORT OF THE ENTOMOLOGICAL SOCIETY OF ONTARIO FOR 1877.—This is another of the valuable annual reports which we owe to the enlightened liberality of the Legislature of Canada. How easily the Legislatures of our own States might secure the publication of similar contributions from resident entomologists! The Entomological Society of Ontario publishes a 20-page monthly magazine, called the Canadian Entomologist. The second number of the tenth volume (February, 1878,) now lies before us. The nine completed volumes contain a very large amount of valuable information, embodying some of the results of the labors of the best entomologists in North America. Although no line can be drawn between so-called "scientific" and "practical" writings—indeed the most scientific writings are the most practical—yet these volumes contain much which is eminently practical in every sense of the word. The Provincial Legisature grants $750 a year to the Society, which makes possible the continued publication of the magazine and secures the preparation, every year, of such a report as that here noticed. The magazine is distributed to subscribers, a copy of the Annual Report being thrown in; thus non-residents may obtain a copy of this Government report, on demand, and without having to beg it as a favor,—an advantage which attends the printing (we cannot say publication) of few other Government reports with which we are acquainted. The subscription price of the Entomologist (to be paid to J. WILLIAMS, Esq., London, Ontario) is one dollar in gold for Canadian subscribers, but, in spite of the circumstance of equal cost to the publishers, United States subscribers have to pay one dollar and twenty-five cents, currency. The articles of special value in the present report treat of the food and reproduction of the "Colorado" Potato-beetle, a moth destructive to pine-trees, and some beetles boring in pine, maple, locust and apple trees and raspberry bushes. The pamphlet contains iv + 59 p. (25×15 cm.), one pl. and 50 fig. It is marred by numerous typographical errors, and most of the figures have been published many times before.

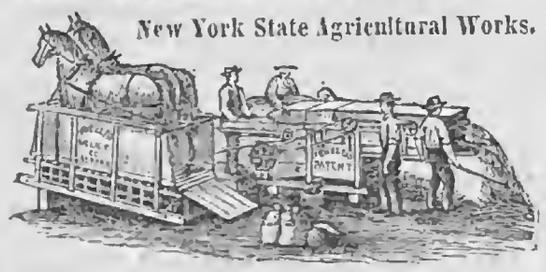
We give this extended notice not as a favor to the publishers, who make no private gain from the magazine, but for the benefit of those of our readers who are not to be classed with the man portrayed on page 180 of the present volume of the RURAL NEW-YORKER.

New Advertisements.

USE THE BUFFALO
HONEST FERTILIZER
Ammoniated Bone Super Phosphate,
AND
Pure Ground Bone.

The purity of these goods is guaranteed, and their standard proved by regular analyses of Prof. G. A. Liebig, and other eminent chemists.
No Rock Phosphate, Mineral Guano, Land Plaster, Salt Cake, Spent or Sludge Acid, and other inferior materials, enter into the manufacture of my Phosphate, which is solely made of **Bone, Meat, Blood, Pure Acid and Potash Salts.**
My Works are always open for inspection to every consumer of Fertilizers.
Highest Premium and Medal of Honor awarded to my Fertilizers by the Centennial Commission, Philadelphia, 1876.
Send for new Spring Circular, containing full directions and testimonials. L. L. CROCKER.
252 Washington Street, Buffalo, N. Y.

MEDAL MACHINES.
New York State Agricultural Works.



1st Premiums at all Competitive Trials.
Railway, Chain and Lever Horse Powers, Threshers and Cleaners, Threshers and Shakers, Clover Hullers, Feed Cutters, Wheel Horse Rakes, Horse Pitchforks, Shingle Machines, Straw Preserving Rye Threshers, Portable Steam-Engines, Cider and Wine Mills and Presses, Dog and Pony Powers, Etc., Etc.
WHEELER & MELICK CO.,
ALBANY, N. Y.
Send stamp for Circular and report of Centennial trial.

A FARMER,
A Farmer's Son or Daughter,
taking orders for five of NELLIS' HARPOON HORSE HAY FORKS and FIXTURES will (in addition to the profits,) receive FREE a complete rig of Nellis' Fork and Patent Conveyor, for depositing Hay or Straw in mow or on stack. Also man'frs Nut Shell Hay Carrier, Pulleys and Grapples; Agt'l Steels. Nellis' Cast Tool Steel Castings (Plow-Shares from this steel can be welded, worked into chisels or edged tools); Ornamental Fencings for public grounds, cemeteries or farms. Pamphlets Free.
A. J. NELLIS & CO., Pittsburgh, Pa.

Matthews' Garden Seed Drill,
-Matthews' Hand Cultivator,
Matthews' Drill & Cultivator combined, surpass all others. Send for Circular before you buy.
Manufactured only by
EVERETT & SMALL,
Boston, Mass.

CHOICE BUTTER.
Over 1,000 Dairies and Creameries have introduced the Cooley System. Read what people say about it who have used it:
(From Massachusetts Agricultural College Farm.]
AMHERST, Mass., Feb. 9, 1878.
VERMONT FARM MACHINE CO.:—We are so well pleased with the Cooley Creamer that I feel bound to say a word in its favor. It takes us only twenty minutes to churn, and the extra yield of butter is wonderful. I have cheerfully recommended it to to the Japanese Government above all other systems. A. A. SOUTHWICK, Farm Supt.
OGDEN FARM, NEWPORT, R. I., Feb. 7, 1878.
GENTS:—I have thoroughly tested the cans and chest (Cooley's) that we had of you last fall, and am now using that system in preference to that employed by Col. Waring in former years. I feel that I can fully recommend it. MELVILLE BULL.

THE
RURAL NEW-YORKER.

PUBLISHED EVERY SATURDAY.

Address
RURAL PUBLISHING CO.,
78 Duane Street, New York City.

SATURDAY, APRIL, 13, 1878.

BELLS.

JOYOUSLY ring the birth-day bells, greeting the welcome advent of a diminutive stranger in the neighborhood; merily peel the bridal bells, giving gladsome tongue to present bliss, and confident promise of future happiness and progeny; dolefully tolls the passing bell, sadly telling the flitting of another soul to judgment and eternity; loudly clamor the church-going bells, importuning the faithful to prayer or prompting the unregenerate to display; gleefully jingle the sleigh bells, enlivening the silence of winter's scenery; loudly clangs the cow-bell, telling where mild-eyed Brownie nibbles the grass; hastily jangles the front-door bell, calling Biddy from the kitchen and Arabella to the window; gaily laugh society belles, charming the hearts of their favorite worshipers; while bells of victory and even the terror-spreading tocsin come also trippingly on the tongue, sung of, most of them, for generations by poets, and rhymed of, all of them, for years by poetasters; but the Moffett bell—the bell of the future—is as yet alike unknown to the bards of Castalia and to those of Grubb Street.

In Virginia, although in use barely a twelvemonth, it has already won a goodly multitude of greenback if not golden, opinions, as the treasury can testify; in Washington it will, probably ere long, check the chronic guzzling even of thirsty politicians; while in our own State and still more in this city its introduction would do much to refill the coffers plundered by TWEED and his associates, and this out of the pockets of his staunchest supporters—the topers of the community. Accurate statistics compiled by prohibitionists, and moderate estimates therefrom, show that 140,000,000 glasses of alcoholic liquor and 1,120,000,000 glasses of ale and beer are drunk in this city every year, costing at least $70,000,000. Under the Moffett law, levying two cents upon every glass of "hard" liquor, that class of drinks would yield $2,800,000, and a tariff of half a cent on every glass of ale and beer would give $5,600,000, making an aggregate of $8,400,000 revenue per year, aside from specific license fees. This income would be about sufficient to pay the interest on the dept of the city, and would relieve the tax-payers of about one-third of their burthen. Nor could it always escape the mind even of the most besotted toper, as he fumbled for the price of his liquid destruction, that

> Of manhood and thrift, with the Moffett bell,
> The Imp of the Bottle was ringing the knell.

STEWART'S HOTEL FOR WOMEN.

THIS building, begun some time before the death of Mr. A. T. STEWART, has at last been completed and was opened for guests on the 3d inst. It has been so often and fully described, we will not repeat it here.

That the enterprise is a commendable one and will do much good we doubt not, but it is questionable if the original design of the founder will be satisfied. It was generally supposed his idea was to benefit working girls, such as could earn not more than five or six dollars a week, and who could find no respectable places in which they could obtain board for such price as they could pay.

The price in the Womans' Hotel is fixed at from six to ten dollars a week. There seems to be no good reason why it should be so high unless there is much expense incurred in furnishing the tables with a greater variety of dishes than is necessary, which we suspect. We understand the building furnished in all its details, is really a gift to the women of New York and held in trust for them and as there is no rent to pay there seems no good reason why the prices of board should not be made lower. In comparison we would note the Business Women's Home in Brooklyn. This institution was organized a few years ago by some ladies noted for their connection with all good work, and has been in successful operation from the first. With a little money and a large mortgage they obtained possession of a suitable house that accommodates about fifty, and the price for board has at no time exceeded five dollars for the best rooms, with lower rates for those on the upper floors—there being no elevators. At these prices the Home is self-supporting, and we have never heard complaint of the quantity or quality of food, nor of the proper attention to rooms. That the management both financial and otherwise is excellent the result proves, and the managers certainly deserve to be known as business women.

The Women's Hotel is a palace fitted up with all conveniences. The value of the premises is enormous, and the taxes alone form a considerable item of expense. It is not to be supposed for a moment that Mrs. STEWART will allow it to be a place where managers or superintendents will be permitted to enrich themselves at the expense of working women, and it may be presumed that when the receipts will warrant the prices will be reduced.

We cannot speak too highly of such homes properly managed. Any single woman who has had experience in seeking a boarding place in New York and remembers the manner, unkind if not insulting, in which in most cases she has been repulsed with the reply "We don't take single women" will rejoice that there is to be in the future places where spinsters will not be looked upon as objectionable as inmates and we heartily commend the establishment of such institutions in all cities and large towns to those who, having money, desire to use it where it will do most good. At the same time we would suggest that the two above referred to be examined and compared as we think it will be found that more good can be done with the same money in less elegant, costly and ostentatious buildings, than STEWART'S Hotel for Women.

The Best Time to Transplant.—The sooner that shrubs and trees are transplanted now the better. Indeed, the past has been one of those winters when transplanting might have been safely conducted at almost any time. Many advise waiting yet awhile before evergreens are removed, but we repeat that early removals have with us been attended with the best success. It is only needful to *protect* the *roots* from drying winds. We also advise the cutting back or at least the disbudding of evergreens the same as decidious, ornamental and fruit trees are cut back when transplanted. We have by slow degress arrived at the conclusion that evergreens are more benefited by this procedure than the others. If the leading upper buds are removed more vigor is thrown into the lower ones and that bushiness of the base is insured in after years without which, the evergreen is shorn of half its beauty.

What Fertilizer is Needed?—If a farmer does not know what special fertilizer his land is deficient in and can not experiment, stable manure is the safest and probably the cheapest for him. This furnishes all the ingredients of plant food, though probably not in the quantities needed by his crops. This can only be ascertained by experiment. In very small plots, potash, nitrogen and phosphoric acid may be used separately, and the crop so treated which yields most, answers the question what fertilizing ingredient the land most needs for that particular crop. An experiment with potatoes may be made at a small expense and may lead to valuable knowledge. Plant one section and use only old stable manure—upon an other sow a small quantity of muriate of potash. Fifteen or twenty pounds of this may be purchased for fifty cents, which would suffice for a tenth of an acre. Compare the results of the two crops. As we have already advised our farmer readers to do, we have laid out parts of our farm in plots thirty-three feet square and upon each we propose to try the effect of different fertilizers upon the same and different plants.

The Rural.—We are often told now-a-days by good, conscientious people that the RURAL is now the best journal of its class. The RURAL has in days gone by claimed this for itself when it would have been as well to have kept silent or claimed less. Whatever editors may say of the journal they edit, people will after awhile judge for themselves, and as that is just what we want them to do now, we refrain from any expression of opinion other than that the RURAL is experiencing a success greater than it has known during the past six years. We shall earnestly strive to merit this success and to force its recognition upon all the good people of our country.

NOTES.

Improving Corn.—For your seed, do not forget to plant a patch by itself on excellent well-tilled soil. Plant rather thinner than common to give each plant a good chance. Before the tassels are ready to shed any pollen, cut out all the feeble stalks—those which do not promise to ear well. By so doing you will select good male as well as female parents to all your kernels of corn. This is one step in advance of the common practice of farmers—and is practised and recommended by our correspondent, Professor BEAL.

Pear Blight.—There have been so many experiments made on this subject, is it not about time that some expert collected them all in the form of a recipe book? If these had a good index, they would make an interesting volume and no doubt save much time and money in repeating experiments and in writing them up for the agricultural press or the waste-basket. Many persons have tried various means which they acknowledge have failed, while there are still many others who have found a certain (?) remedy.

Chickens a Remedy for Insects.—For pickles, do not be in too much of a hurry to plant cucumber seeds very early. When the weather gets warm and settled the young plants grow faster. Arrange the matter so as to have several coops of chickens scattered around among the plants. If you have no chickens, borrow some, for there is no better remedy to keep away the insects than plenty of young chickens a few weeks old. No one who has ever tried it will be satisfied to give up this plan.

Planting Peas.—In light soil for the main crop they should be planted much deeper than is the common practice. Try this experiment, as we have, and satisfy yourself. Plant some four, and some six, and some eight inches deep and we think you will be satisfied that those do the best which are down five to seven inches. They are less liable to mildew and they bear longer and more seeds.

Seedling Potatoes.—If you wish to raise new sorts, remember that they can be raised very easily by starting them early and treating the young plants the same as you would tomatoes. If well cared for each of the best should produce a good yield of fair-sized tubers in the first year—we mean that there should be found six to eight pounds of tubers to the plant.

BREVITIES.

THERE was a large meeting of stock men in Indianapolis April 3.

CHARLESTON strawberries have been in the N. Y., markets since the 1st of April.

IT pays well to keep the poultry house and yard clean and tidy. The same may be said of the pig-pen.

A MIXTURE of powdered hellebore and sulphur is good to sprinkle upon the backs and around the nests of sitting hens.

OUR first page this week presents the first of a series of fine engravings which we shall lay before the reader from time to time.

EVERYBODY that has water privileges upon his farm or grounds should plant, at this season, the beautiful, sweet-scented Pond Lily, Nymphæa odorata.

IT is thought that Doryphora has had a good, sound refreshing sleep the past winter and that she will awake to resume the spring campaign with her best energies.

TAKING high rank among exquisite nuisances is the Spitz dog. Question: Is it worse that one person should die of hydrophobia or that the entire race of dogs should be exterminated?

ONE of our best contributors writes: "The longer I live, the more I learn, the shyer I become of deciding for certain the truth about anything." We commend this to all "smart" men generally and to editors in particular.

WE have an idea that if many farmers knew the amount of commercial fertilizers that they annually waste upon their lands because they do not contain the manurial ingredients which the lands need, that they would enter with a hearty interest into the experiments which we have advocated in late issues.

Do not *ever* sow oats or other grain with grass seed upon the lawn. The blades of the oats, it is true, will shade the tender grass. But except in periods of drought, this is not needed; and during droughts, the oats will do more harm by extracting moisture from the soil than good by the shade they give.

THOSE who buy currant or gooseberry bushes as late as this, will do well to cut them severely back. No fruit would be borne this year if this were not done, and the expanded leaves not receiving a sufficiency of sap from the roots will exhaust the stems and cause weakness from which it may require a year or so to recover.

OUR respected correspondent, Mr. S. B. PECK, states, in the Report of the Michigan Pomological Society:—"Were I some forty years less than seventy-two of age, I would make a mark upon this shore (Michigan) that would show up the capabilities of the region; but my age and infirmities warn me that I had better let the cremation of my one thousand fruit trees of the past season wind up my pomological career."

THERE are few others plants that will do well in a greater variety of soils and climates; no other whose fruit is more delicious; no other that may be cultivated with less trouble than the grape. There is no other that all this may be said of that is so neglected, especially among the farming community. We have said to our friends "plant a grape-vine." We can only repeat our advice now that the planting season has arrived.

WHEN seeds, either in the cold frame in pots or pans or out-of-door seed-beds, come up too thickly, it is well to cut off the first leaves with sharp pointed scissors rather than pull them up, which deranges the soil and interferes with the delicate roots of those that are to remain. The tiny plants are at this stage dependent upon the first leaves for life. The same may be said of radishes, lettuce &c., which sowed too thickly in rows, have to be thinned out.

PROFESSOR C. S. SARGENT, in his valuable "Notes on Trees and Tree Planting," gives the following table of the actual prices, in the Boston market, of the principal American woods employed in cabinet-making, to show the comparative estimation in which they are held:

Black Walnut	$75	per 1,000	feet.
White Oak	65	"	"
Cherry	60	"	"
[illegible]	50	"	"
White Ash	40	"	"
Sugar Maple	40	"	"

PROF. BEAL says that he has, from considerable observation, decided that the lack of apples some years is due to poor male organs in the flowers. This has come under his notice while crossing apples. Some years he finds it almost impossible to find pollen to use in crossing, and these are the "off years" with the apple crop. Now what we want to know is how to improve the male organs so that they may supply plenty of pollen the "off year."

THE third number of the first volume of the South Georgia Agriculturist, published at Thomasville, Georgia, and edited by L. C. BRYAN, has just reached us. It is a small monthly magazine of 34 pages, mainly devoted to the diffusion of agricultural, literary and scientific knowledge among farmers and their families. The form is neat, the typography excellent and the contributions, selections and editorial supervision good. We wish this new claimant to public patronage all the success it promises to deserve.

Literary Miscellany.

TOM'S LETTER.

Now Mollie, lay your knitting down, 'tis after set 'o sun,
And soon the stars, like angel's eyes, will peer out one by one
From where they hide the whole day long, deep hidden in the blue,
And look upon the evil and the good that people do.

I've got a letter here from Tom—nay, wife you need not start—
The boy is well, there's nothing here to pain a mother's heart.
He says he's gathered in the grain, a goodly golden store;
He says he's paid the mortgage off and laid up something more.

Well, wife, tain't quite two yeras ago, one sultry summer day.
When I was working in the fields and getting in the hay,
A carriage drove up to the door, and there alit a chap.
With laughing eyes, like yours, that looked from underneath his cap.

He helped a little maiden out, with sunny, gleaming hair,
And deep blue eyes that looking in you seemed to read a prayer;
I tried to make out who they was, but wife, I did'nt know:
I could'nt make the team stand still, and kept a hollerin' "Whoa,"

I saw him point across to me, and heard him something say;
I could'nt make the words out, their heads were turned away;
But then an idee struck me quick, just like a ray 'o dawn
Although I did'nt know the girl, I knew the boy was Tom—

My boy who ran away from home so many years before,
Our Tom, whom we had mourned as dead a dozen years or more.
I left the team a standin' still, and threw the whip away—
The hull they might ha' gone to smash, I would'nt ha' cared that day,

I reached the house before 'em wife, but naught to you I said;
Somehow, harsh words I'd said to Tom, kept poppin' thro' my head;
I could'nt help but think perhaps, I'd been too quick to strike—
I'd learned that men like horses, wife, is seldom two alike.

They never stopped to knock at all, but open flung the door—
"Well, father, I've come back," Tom said, "to see you all once more."
I threw my arms around his neck, broke over all may rules,
You did the same, we laughed and cried together—both like fools.

When all was still we found the girl with blue eyes was Tom's wife,
A little daisy he had won to brighten all his life.
How well we learned to love the bride; and when they went back West,
They wanted the old birds to come and see them in their nest.

"Go and read the letter!" why I've read the letter thro',
Hold on, now, here's a postscript, with perhaps a word for you,
Good gracious! what a funny thing, it takes my breath away—
"Tell mother,"—say wife look at me; is my hair turning gray?

And grandma call me grandpa, just to see how it will seem,
Oh, wife, I think I feel as big as Sheba's famous queen,
"Tell mother"—kiss me quick and lay your head upon my arm—
'God sent a little baby down to visit at the farm."

—R. L. CARY, JR., *in Cleveland Herald.*

CORA.

CHAPTER X.

MRS. COLSTON was sitting in her dressing-room preparing for conquest—in other words, adorning her handsome, portly person for a party she was giving at her house at Brixton. With Mrs. Colston, adorning was by no means a slow or unimportant process. She was fond of rich heavy silks and vivid colors, and it was only by the judicious advice of her maid that she was prevented from making herself a little ridiculous by her affection for crimson and purple. On this particular evening she was looking annoyed and out of temper, and the patient abigail had had much to endure during the hair-dressing process, although she was at a loss to know what had annoyed her mistress. The green satin robe, which had been sent home that afternoon, fitted to perfection, and had surely a sufficient amount of gold embroidery and heavy lace. Mr. Colston's last present—a handsome set of emeralds—was lying before her on the dressing-table, glittering in their soft satin bed, and it was hardly likely that that should have aroused her ire; but it is certain that she did not appear at all on good terms with herself, or the world in general, and for once she seemed anxious to get rid of the important business of dressing.

It was over at last. The folds of the green satin were arranged for the last time, the emeralds were clasped on the rounded arms and still handsome shoulders, and when the maid had handed her mistress her fan and lace-trimmed handkerchief, she rather anxiously awaited her dismissal.

"Hand me my gloves, Eliza," said Mrs. Colston, adding, as the order was obeyed: "Go up to Miss Sinclair's room, and, if she is dressed, ask her to come down to me for a few minutes."

"Yes, ma'am."

And Eliza curtseyed; and disappeared.

In a few moments Cora came in, and Mrs. Colston, looking up from her gloves, surveyed her young guest with very dissatisfied eyes.

Cora was dressed with much simplicity, in fleecy black skirts, with black lace falling over her white shoulders and shading the fair, rounded arms. Her ornaments were of gold, quaintly designed after the pattern of ancient coin jewelry, and the only adornment of her graceful head were the shining masses of her rich hair, which was drawn softly back from her pale brow.

She was looking most beautiful, and an innocent satisfaction smiled out of her large gray eyes.

"Eliza says you want me, Mrs. Colston," she said quietly.

"Yes," replied the lady, coldly; "I have a few words to say to you. Will you sit down?"

A little surprise appeared on Cora's face as she took a seat, and sat quietly playing with her fan, until Mrs. Coltson should speak again.

"It is very unpleasant for me to make any complaint, Mis Sinclair," she began, in a complaining tone, which made Cora raise her eyelids in surprise. "I should much prefer not to be forced to do so; but it is my duty. Whilst you are under my roof I must consider myself as your guardian, and, to a certain degree, responsible for your conduct."

Cora opened her eyes wide, and looked at her hostess, astonishment plainly visible on her beautiful, wondering face.

"You are very young," went on Mrs. Colston, a little more complaisantly and fluently as she proceeded, "and perhaps a little bewildered at the rank of those with whom you have been brought in contact, and been intimate to a certain degree. But you must not set too much store on such pleasant attention from those above you. I am willing to believe that, blamable as your conduct is, you have erred through ignorance only, not from any evil intention."

"Blamable — evil intention — my conduct!" stammered Cora. "In what way do you mean, Mrs. Colston?"

"I mean with regard to Lord Almane," said Mrs, Colston, sharply. "There is no use pretending ignorance when the way you monopolize his attention is the source of universal remark and censure."

Cora's eyes blazed with indignation; but before she could speak Mrs. Coltson went on:

"Even his lordship has noticed, and commented upon the indelicacy of your conduct towards him," she continued, with increased severity. "Even under other circumstances it would be unladylike, and unbecoming to a degree; under the present, the manner in which you throw yourself at the head of an engaged man is most shocking."

Cora rose, trembling in every limb, all her girlish delicacy and refinement outraged, every nerve quivering at the coarse words; but again Mrs. Colston's interposition prevented her from speaking.

"There is no use in your flying into a passion and adopting mock airs. You cannot deny that you have tried to lead Lord Almane on in every possible manner, and that Lady Lucie has been very unhappy about it."

"I deny it!" said the girl, passionately, finding her voice at last. "How dare you insult me so? How can you so cruelly take advantage of my position alone here? If Lord Almane has said——"

"If!" interrupted Mrs. Colston, rising angrily. "Do you then accuse me of falsehood, Miss Sinclair? Do you think I could assert it, were it not the case?"

"Then he has spoken falsely," returned Cora. "He knows it is not so, and you know it too, Mrs. Colston; how dare you repeat such a calumny?"

"You use strong words, Miss Sinclair," said her hostess, with suppressed passion. "You forget yourself strangely in speaking thus to me. Leave my presence at once, and to-morrow, at some more fitting time, and when you are calmer, we will resume our conversation. It seems to me but too true," she concluded, with scorn in her tone and gesture, "that Lady Lucie has indeed cherished a viper in her bosom, and one who would strive to wound her in her tenderest affections."

Cora left the room, hardly able to stand, from conflicting emotion; and when she reached her own room she let herself fall upon a chair and gave way to a passionate burst of tears. She had tried so hard, poor child, to steer clear of the rock of Almane's passion for her, taking care in every way not to give him an opportunity of speaking words she did not wish to hear; and now to be thus misjudged and insulted seemed more than she could bear. Could it be true that Lord Almane has spoken so untruly, and that Lady Lucie whom she loved had believed the falsehood? What could she do? To whom could she turn? That very night she would write to Harold and confess that she had deceived him, and ask him to come back to her and not leave her again. She would tell him that she had suffered Lord Almane to care for her, that she had loved him in return; that during her stay at Mrs. Colston's she had met him constantly, although she had never mentioned this meeting to Harold in any of her letters; and he, Harold, would pity and forgive her, and take her away somewhere—away from the fascination of the beautiful face, and low tender tones which had sounded so dangerously musical in her ears. She could never be happy again; but she did not deserve to be so; her deception towards Harold could not be too severely punished.

She heard the carriages succeeding each other up the drive, and rose from her seat to go to her writing-table to make her confession to her brother. But she had scarcely prepared her paper and pen when a slight knock came to her door, and Mrs. Colston's maid said:

"If you please you will come down, Miss Cora? The dancing has begun."

"Very well," said Cora, quietly, as she locked away her writing materials and bathed her eyes to efface the tear-marks from her eyelids. As she did so there came a dangerous longing over her, a longing to tell Lord Almane all, and receive his assurance that Mrs. Colston's assertion was false, and to have her misery soothed by his tender words and glances.

When she reached the gorgeous, glittering drawing-rooms, which set Lord Almane's teeth on edge with their bright colors and gaudy adornments, she found them already filled, and dancing going on vigorously.

Among the dancers she saw Lady Lucie, who gave her a little smile of greeting, which seemed cold and constrained to Cora: but Mr. Colston, who came up to introduce a partner to his pretty guest, prevented any more thought upon the subject, For three or four dances Cora's time was fully occupied, and it was only at rare intervals that she caught sight of Lord Almane's handsome, distinguished face, as he stood in the doorway without an attempt to dissemble his *ennui*. But just as one of Miss Sinclair's partners had relinquished her, after a polka, his lordship made his way towards her, and obtained a seat by her side.

"At last!" he said, with a sigh of content, "I thought you would be unattainable this evening, and was almost in despair. I hope your programme is not quite filled up."

"No," she answered, lifting her restless shining eyes, full of sorrow and pain, to his; "I kept some free for you. I want to speak to you, Lord Almane."

"What is it?" he asked, gently, noticing the sudden gravity of her manner. "Are you ill, Cora?"

"I am not ill," she replied. "but am very unhappy. Let me speak to you quietly, Lord Almane, and you shall know the cause."

"Come, then," he said, drawing her hand through his arm, and leading her through the crowded rooms into a smaller room opposite the conservatory, which as yet had not been discovered, and was empty and quiet.

Cora sank down on a low seat, growing very pale now when the moment of explanation had come, while the Viscount took his seat beside her.

"What is it?" he asked again, noticing her pallor. "I am sure you are ill, Cora! Let me get you something, my child."

Cora laid her hand on his arm to detain him.

"Do not go," she said: "I want nothing—but truth."

"Why this strange solemnity, dear Cora?" he asked, smiling a little, "Is it something very serious which occupies you? Come, tell me quickly. I shall begin to image all kinds of horrors, if you keep me in suspense."

"Perhaps you will think lightly of it," she answered; "but I cannot do so. Oh! be frank with me, Lord Almane. Has anything in my conduct since I met you here, in this house, deserved your contempt? Have I betrayed by look or word the love which—Heaven help me—I could not help feeling for you?"

"My contempt!" he repeated. "Cora—love—how——"

"Ah, hush!" she interrupted. "A truce now to the fair words and sentences by which you beguiled me once. I do not deny my love for you—it, in itself, is no sin; but were I to indulge it, and allow you to speak of it, it would be so. I want only that answer. Have I deserved that you should despise me and that even strangers should censure, in the plainest terms, my behavior to you?"

"Who has dared to do so?" he said, haughtily. "Who has dared to remark upon your conduct or mine?"

"Many, it seems," she answered, sadly. "Even you yourself, it is said, have commented upon mine."

"It is false!" he replied, vehemently. "Cora, you know it is false. My darling, whoever spoke thus to you lied foully and utterly. Can you have believed for one moment such a baretaced falsehood?"

"I did not know, I could not tell," she faltered; "I hardly thought it possible, but still——"

"Do you think that, loving you, I could breathe one word against your fair fame, my dearest?" went on the liquid musical tones, as he fixed his dark velvety eyes upon her face. "Against you, whom I hold as sacredly as I might my dead mother—upon you, whom, were it but possible, I would make my wife to-morrow! Cora," he continued, with loving reproach, "I could not find it in my heart to be angry with you."

"You must not speak thus," she answered, faintly. "I ought not perhaps to have spoken, but the thought almost killed me."

"My poor, poor love!" he murmured, fondly. "Ah, Cora, why are things so hard for us?"

Large tears had gathered in Cora's eyes, but she would not allow them to fall.

"Can you forgive me for the trouble I have brought to you, my child?" he asked, tenderly. "Will the time come when you will wish we had never met?"

He rose and paced up and down the little room for a moment. Cora, a prey to almost uncontrollable emotion, bowed her head upon the sofa-cushions, and tried to recover her composure, but it was some moments before she was able to speak calmly.

"Do not let us blame ourselves for what could not be helped," she said faintly. "Go back to the ball-room now, your absence will be noticed."

He bent over her for a moment, murmuring a few words of farewell, and left her. Cora sat still for a few minutes; then she rose, pushing back her hair from her brow with a troubled gesture, and started with astonishment when she found she was not alone. A young girl, in shimmering pale blue robes and sapphire ornaments, was standing beside her, and as she looked up she met Lady Lucie Belmont's blue eyes, full of silent reproach and sorrow.

Neither spoke, but Cora's head sank again upon her hands, and the silence in the little room grew almost oppressive.

Suddenly her name, spoken by several people, struck on Cora's ear. She rose in some agitation and alarm, and stood expectantly. Then simultaneously she and Lady Lucie moved towards the ball-room.

At the door Mrs. Colston, with some consternation legible on her face, was talking to a tall man wearing a loose traveling suit, and looking both weary and travel-stained, who was apparently apologizing for his intrusion.

As the girls drew near Mrs. Colston turned to them.

"Ah! here is Miss Sinclair," she said, as she went forward to meet Cora and took her hand in hers. "Come this way, Sir Alan," she continued, as she led the way into the room Cora had just left, closing the door when they had entered.

Cora looked from one to the other in astonishment. She saw that Mrs. Colston looked grave and compassionate, that the tall stranger seemed agitated; but there was nothing familiar to her in his grave gray eyes and rugged, massive, but handsome features, and she waited in some anxiety for him to speak.

Sir Alan saw a pair of lustrous eyes fixed upon him questioningly, and the carmine lips parted in expectation; and his voice failed him when he attempted to impart the sad news he brought.

"This gentleman has come from Rome, Cora," said Mrs. Colston, quietly.

"From Rome!" said Cora, breathlessly, turning to him. "Then you bring me news of Harold. Do you know him? He is quite well? Why do you look at me so sorrowfully?" she went on, passionately, as she met the pitying gray eyes.

"I have come to bring you to him," said Sir Alan, gently. "He has not been quite well since he went to Rome, and——"

"You are hiding something from me!" And Cora sprang to his side, and caught his arm with both her little trembling hands. "He is ill, perhaps—no! no! no!" and her voice rose almost to a wail, in her agony of terror—"he is not dead—not dead?"

"No, on my honor," said Sir Alan, quickly. "But he is very ill, and he wants you. I have been too abrupt," he continued, sorrowfully, as he saw the color fade and the large eyes close, and holding out his arms received into them the inanimate form of Harold Sinclair's sister.

CHAPTER XI.

By dint of traveling day and night Cora and Sir Alan arrived at Rome not too late; but the latter's first glance at Harold when they entered his room showed him that the end was near.

"So you have brought her to me, Alan?" said Harold, smiling, as he folded his sister in his weak clasp, and turned his blue eyes in grateful recognition on his friend. "Has he taken care of you, Cora?"

But Cora, with her face hidden on the pillow beside her brother, could not answer; and Harold let the first bitterness of her sorrow pass unnoticed, while he asked Alan about their journey; and then the young baronet went softly away, and left the brother and sister together.

Inexperienced in sickness as Cora was, she could not fail to see that there could be no hope of Harold's recovery; and in that moment of sorrow, of grief unutterable, the girl felt as if her heart must break with its load of anguish. Harold had been so much to her—father, mother, and brother in one—and he had loved her with such an entire devotion that, in losing him, she lost all. It was no wonder that she gave way, although Dr. Crosby, who had met them on their arrival, had warned her gently of the ill effects of any excitement on Harold.

"I am afraid it is hard for you, darling," said Harold, softly, after a pause. "But Alan has promised me that he will be good to you, and take my place. Ah! you think no one could now, little sister; but you would not have always said so, you know."

And he went on with the tender, consoling words, until Marianna came in with a sharp reproof to Cora for tiring her brother, and an imperative injunction that she should go instantly and change her clothes, and rest.

"I can rest here," entreated Cora, as she rose. "Hal, do I tire you very much? I may come back, may I not?

"You must let her be with me as long as she can, Marianna," said Harold gently. "Why, what a dusty, travel-stained girl it is! Go and make yourself presentable at once, and put a red ribbon in your hair, mademoiselle."

Tedious as young Sinclair's illness had been, his sweet temper and patience had never failed him, and he had greatly endeared himself to all around him. There was not one among his acquaintances, not one among the servants in the

gloomy old palazzo where the artists had taken up their residence, who did not regret the golden-haired young Englishman who was passing away from among them.

"I wonder what has become of Alan?" said the dying man towards evening, as he lay raised up by pillows, having rallied a little with the excitement of his sister's arrival.

"He is in the house signor," answered Marianna, quietly from her seat near the window; "but he was afraid he might disturb you and the signorina."

"Ask him to come," said Harold.

And Sir Alan coming in, found Cora, in her pretty, fresh garments, sitting by her brother, who greeted him with a smile.

"You would not have been *de trop*, old fellow," said he. "I wanted to thank you for your kindness to this child. It was a foretaste of the brother's part you are going to act towards her when I am gone. You don't know what a fellow he is, Cora," he added, smiling—"as strong as a lion, and as gentle as a woman!"

Shortly after, Dr. Crosby came in, followed by George Leeson; and when the physician left the room both Cora and Alan followed him.

"Have you brought a good stock of courage with you, my dear?" said the doctor, as he took the young girl's hands in his. "You must be brave to-night, and to-morrow you shall cry. Your brother will not suffer many hours now."

Cora turned from him with a gesture of despair, while a fit of shuddering came over her, and she trembled so exceedingly that the baronet called Marianna, and left the girl to her care, while he returned to Harold.—To be continued.

INTEMPERANCE.

C. C. W.

ONCE upon our nation's honor
Lay a dark, unsightly stain;
We of that great crime were guilty,
Buying, selling, "souls of men."
And we fought and prayed against it—
Prayed God to remove the stain;
And He did it—not in our way,
In His own. He broke the chain.

Now another mighty evil
Threatens to destroy our peace;
Daily binds unnumbered victims;
In our streets its thousands slays.
Friends and neighbors, they are dying;
They are falling all around;
And our brother's blood is crying—
Crying 'gainst us from the ground.
And the voice of God is calling:
"Who is on the Lord's side, who?
Take unto you trusty armor,
And go forth to meet this foe.
Long enough hath this Goliath
All our Israel's hosts defied."

Courage, brethern, we shall conquer;
Truth, and right are on our side.
Not with carnal weapons fight we
'Gainst this great and crying sin;
But with spiritual ones, and mighty;
Weapons that are sure to win.
"In the name of God," like David,
Go we forth with sling and stone;
Never need we go unaided,
For the battle is His own.

SEASONABLR HINTS.

MARY A. E. WAGER-FISHER.

I WISH to commend to the RURAL farmerines who cultivate flowers, the convenience and advantage of using what is called the "German Hot-bed" in the germination of flower seeds. Last year, I sowed over eighty varieties of flower seeds in hot-beds, of this sort during the last week in March, and excepting Lantana seeds all were successful. The hot-beds are constructed in the usual manner, except that in lieu of using window sash and glass for covering, we stretch and nail to a frame snugly fitting over the box, cheap muslin (at six cents per yard) and then give the muslin a coating of raw linseed oil into which an egg has been stirred—three eggs to a pint of oil. This preparation makes the muslin water-proof and translucent. The advantages this cover has over the glass, are in its lightness to handle, and its complete protection to the plants against sun-burn, covers of this kind if well taken care of will last for two seasons. Flower seeds that will not germinate to complete satisfaction in a "German Hot-bed" are surely of "no good," while delicate seeds that often perish from lack of proper conditions when sown in open borders, will thrive marvelously under the muslin cover. Seedsmen are often blamed for selling poor seeds, when the fault lies in the gardening solely. Moreover, most seedlings will give the florist double enjoyment by being given an early start.

Another thing which I wish to commend in this connection, is a wire chicken fence for the flower garden. The feathered tribe and flower-beds and borders were never born for neighborliness. The florist who has to contend with the chicken tribe knows better than anybody else the meaning of "vexation of spirit," while flower beds in a lawn, with which the poultry is on intimate terms, present an appearance too forlorn for comment; while to brush or wire beds, is to cultivate flowers under too great a disadvantage to be enjoyable. What one wants is a spot of ground into which neither fowl, nor beast does enter. Having once upon a time the depredations of poultry to contend with, I inclosed a portion of the lawn upon which a back piazza opened, with a fence which cost in money outlay for wire, $2.15—a bunch of galvanized iron wire of seven or eight hundred yards, costing that much. The posts used were made from saplings brought from the woods and planted at intervals of five or six feet—bark left on. The wire stretched on the outside line of the posts was held in place by large-headed tack nails. The fence, when done, was scarcely noticeable a few rods away; but in midsummer it was a curve of beauty, being overrun with climbers of various sorts, for which it served as a trellis, Morning Glories, Cypress vine, Maurandia, Nasturtiums etc. Petunias I think would be better to plant in the border following the fence, than vines even, as when trained against a wall or frame, they often present a superb appearance. As my chicken fence kept out all sorts of depredators, and cost so little, and proved so ornamental, there is no need to add that it paid for itself many times over.

I am glad to see WILLIAN FALCONER advocating the culture of native flora, since so many people can never see the beauty in common things, until some one points it out, and they become fashionable. The Germans cultivate corn in their gardens, for its stately beauty, as we do Cannas—corn being far handsomer to my mind. The French cultivate our common road-side and field Daisy—they call them Marguerites and a pretty bouquet of white bloom they make in a gay border.

One of the pretty uses made of Morning Glories last summer, that I noticed, was the way in which they were trained over a rude fence that surrounded a very elegant dwelling. The fence was nearly draped with them, and to drive past there of a morning and see the incomparable blossoms, white, crimson, blue, violet—illustrating the beautiful text "My mercies are new every morning"—was to see a sight well-worth seeing. But then, I go "daft" over Morning Glories—one way to enjoy them is to cut off a vaseful of the opening buds at night—put it on the table for breakfast, and next morning you will have a vision of beauty at your morning meal, lovely and exquisite enough to humanize, refine and delight you for at least twenty-four hours to come.

In preparing a lawn, the people are wise who plant a part of it thickly with the common wild blue Violets—those fragrant blossoms with "spurs" that the children love to gather and use for "nghting," purposes, nipping off their heads with eager delight. They are among the earliest spring bloomers, are quite hardy, take care of themselves, are always a sight to see, and masses of them in bloom form an expanse of rich color hardly to be surpassed.

Strawberries as a Poison.

Apropos of the poisonous effect sometimes produced by strawberries, which a late number of the RURAL commented on as being altogether improbable, I will mention the case of a gentleman whom I know, who has twice nearly lost his life from eating that delicious fruit. The first time he ate them was when he was a mere lad, and they acted upon him as a powerful poison. It was not until many years later, that he dared repeat the experiment, which he did and suffered again in precisely the same manner. Being extremely fond of the berry, it is quite a deprivation for him to be obliged to pass through life without the privilege of enjoying them except at the hazard of his life.

HOW WE CAN "CIRCUMWENT" THE OLD MAN.

N. J. SANDPIPER.

THE case of the old Mr. LORD seems at last to have been completely settled, but to prevent a recurrence of trouble of this sort, we seem to need some special legislation.

If a man is poor, having merely enough to support himself from day to day, it makes little difference how long he may choose to live, but it is a wretched shame that old men who have plenty of money, should persist in living on, year after year, long after their relations think they should be dead and buried.

In case a bill regarding this subject should be brought before the Legislature, an expert would be needed to put it into proper shape, but the substance might be somewhat as follows:

Whereas, it is a matter of complaint that certain rich men, by virtue of a strong constitutions and care for bodily health, do succeed in living to a great age, and whereas, by so doing they grievously wrong those who are waiting for their death and for their money; and such gross misconduct being not now punishable under the present laws, as it should be,

It is hereby enacted that on reaching the age of seventy any man who may have any considerable sum of money, shall upon application of his legal heirs, immediately give up his said money, and make over any and all of his property—so much of it, at least, as may be worth accepting—provided always that he be allowed to retain one suit of old clothes and such other personal outfit as decency may require.

And in case the said rich old man shall refuse to give up his said property, he shall be compelled to do so at once by force of law, any court being held to have jurisdiction in such matters, for the more speedy furtherance of the ends of justice.

And be it enacted that this law is to take effect immediately..

It may be said that the motto "give the old man a chance" is too fully carried out in the above, but it must be borne in mind that the public is not prepared for more severe legislation. It is a hardship, undoubtedly, to wait till a man is seventy, before getting hold of his money, especially when those who are waiting are so much better able to spend the money *intelligently* than he is himself; but we are continually having our feelings hurt by the contemplation of just such hardships. It is a dismal sight to see hungry dogs yelping about a well-filled butcher's shop; and when boys prepare a "slide" on the sidewalk for the purpose o upsetting the passers, it is hard for them to see the folks keeping their balance, and nobody going by "on his ear." But times are out of joint.

As a suggestion, it may be said that cases not quite reachable by the above bill might be somewhat hastened by delicate and indirect methods; for instance, put on the old man's breakfast table a placard to the effect that "Watched pot is long a-boiling," or introduce in the same way the poet's sentiment, "The good die first," or leave about the house, in odd places, the business cards of some undertaker, stating that funerals will be furnished at short notice—that is, of course, all but the corpse. Leave the old gentleman to guess who will furnish that.

Some undoubtedly will be calm and comfortable in spite of these hints, saying, in often-quoted words, "None of these things move me." With such old fellows as these, there is nothing to be done but have patience.

THE CLOCK OF CLOCKS.

IN Mengel's building is now on exhibition, in all probability, the most wonderful clock in the world. It was built by Stephen D. Engle, a watchmaker at Hazleton. He is about forty-five years of age and was about twenty years in perfecting the clock. Mr. Reid paid Engle $5,000 for it. Engle never saw the Strasburg clock. In fact, he has not traveled more than two hundred miles from home at any time. This clock stands eleven feet high. At its base it is about four feet wide and at the top about two. It is about three feet deep at the base; gradually less toward the top. Its colors are brown and gold. The Strasburg clock is thirty feet high, yet its mechanism is not so intricate nor has it as many figures as the Hazleton clock. The Strasburg clock's figures are about three feet high and the American clock's about nine inches.

Three minutes before the hour a pipe-organ inside the clock plays an anthem. It has five tunes. Bells are then rung and, when the hour is struck, double doors in an alcove open and a figure of Jesus appears. Double doors to the left then open, and the apostles appear slowly, one by one, in procession. As they appear and pass Jesus, they turn toward him. Jesus bows, the apostle turns again and proceeds through the double doors in an alcove on the right. As Peter approaches, Satan looks out of a window above and tempts him. Five times the Devil appears, and when Peter passes, denying Christ, the cock flaps its wings and crows. When Judas appears, Satan comes down from his window and follows Judas out in the procession and then goes back up to his place to watch Judas, appearing on both sides. As the procession has passed, Judas and the three Marys disappear, and the doors are closed.

The scene can be repeated seven times in an hour, if necessary; and the natural motion of the clock produces it four times per hour, whereas the Strasburg procession is made but once a day, at 12 o'clock. Below the piazza is the main dial, about thirteen inches in diameter. To its right is a figure of Time, with an hour-glass. Above this is a window, at which appear figures representing youth, manhood and old age. To the left of the dial is a skeleton, representing Death. When the hour-hand approaches the first quarter Time reverses his hour-glass and strikes one on a bell with his scythe, when another bell inside responds. Then Childhood appears instantly. When the hour-hand approaches the second quarter, or half-hour, there are heard the strokes of two bells. Then Youth appears, and the organ plays a hymn. After this, Time strikes two and reverses his hour-glass, when two bells respond inside. One minute after this a chime of bells is heard, when a folding door opens in the upper porch, and one at the right of the court, when the Saviour comes walking out. Then the apostles appear in procession. The clock also tells of the moon's changes, the tides, the seasons, days and day of the month and year, and the signs of the zodiac; and on top a soldier is constantly on guard, walking back and forward. As the hours advance Manhood, Old Age, and Death take part in the panorama.—*Reading Eagle.*

THE HUSBAND'S CERAMICS.

SOME women are loth to credit their husbands with good intentions, or to give them the credit due their genius and enterprise. Such a woman lives hard by. She was fairly crazy about ceramics, but in the midst of her pottery decorations she was summoned to New England to see a sick relative. Her husband, good soul, decided to ceramic that house to the most complete extent during her absence, and he invested money enough in transfer pictures to have bought his winter's coal. He pasted old Roman heads on the newel posts, bordered the edges of the stairs, had a paper monkey climbing up each leg of the extension table, pasted an alligator on each panel of every door, had sailors tumbling over each other on the water pitcher, ran a border along the baseboard of the parlor, pasted the teapot with red roses, bordered all the mirrors with lean dogs running after fat rabbits, and gummed the head of a trotting horse on the back of every chair. The panels in the bedsteads blossomed with giraffs reaching out for weeping willows, and serpents trained around the legs of the piano shot mad glances at small mules with their heels in the air.

Some men would have stopped here, and waited to be patted on the back, and encouraged to go ahead. This man waited only long enough to lay in a new supply of pictures and to make some paste. He whacked a dozen giraffs on the tea-kettle, two or three of which seemed intent on going up the spout, fastened an elephant to the handle of the spider, and made the stove boiler fairly howl with its burden of camels marching up and down with their backs all humped up. When every door-knob had been ornamented with the phiz of Queen Elizabeth, and the family camphor bottle had been made the ground-work for a Spanish bull-fight, then the husband threw the shears, four knives, two spoons and his paste pail over the alley fence, and waited for his wife's return.

She arrived the other day. He sent her home in a carriage from the depot, and waited an hour or so before following her. When he thought she had time to thoroughly inspect his work, he went home. Several boys were playing on the walk, and as the husband was unlocking the door, they saw a woman's hand suddenly reach out, seize his collar, and haul in on him, and as his heels twinkled in the air a voice filled with emotion called out:

"I'll paste rhinoceroses on you till you can't wink!"

They are in a scrape in that house—they are scraping ceramics into oblivion, and engaged in a lively discussion.—*Norristown Herald.*

CHARACTER

CHARACTER is so much more than wealth or knowledge, fame or power, that it is the measure of the man. When a man is placed in a prominent position of any sort whatever, we say at once, "what is he worth?" not "what does he know? but "what sort of a man is he?" That is the momentous question that involves all. All others are secondary. Wealth, knowledge, fame and power, are most desirable accessions for a good man; but otherwise they add strength in a wrong direction. I wonder if the young men, and boys in our land, realize that character is the most important capital in any and all business transactions. If a man of large business is looking for a partner or employe what does he require first and of all? An honest man or boy. Wealth and position, with this first requisite, will be no detraction, but nothing without it.

What pillars are to a building, what the foundation is, and the corner-stones thereof, so is a good character to a man or a woman, boy or girl. The wise man said, "A good name is rather to be chosen than great riches," and he had no lack of wealth. Remember, boys—and it will harm none to remember—that what you are is of infinite importance; while what you have is finite in its value; its end is the grave, while the former will grow and enrich its possessor through all the ages of immortality. Strive for it as for your life, for life is naught without it; if a man die for his house, he is an everlasting hero; while if he die for his wealth, he is a sordid fool. We honor it in death, if not in life. "So teach us to number our days, as to apply our hearts unto wisdom."

RECENT LITERATURE.

The Study of Words. Lectures addressed (originally) to the Pupils at the Diocesan Training School, Winchester. By RICHARD CHENEVIX TRENCH, D. D., Archbishop of Dublin. With an exhaustive Analysis, additional Words for Illustration, and Questions for Examination. By THOMAS D. SUPLEE, Head Master of St. Augustine's College, Benecia, California. [12mo.—pp. 335. $1.50.] New York: W. J. Widdleton.

WHEN HAMLET, in reply to the question of POLONIUS, said he was reading "*Words, words, words,*" he may have had an idea of the full significance of his answer, and he may not. That question, however much open to discussion, we do not propose to take up at the present time.

What are Words? is a question susceptible of several definitions, each of which may be entirely true; as, Words are two or more letters of the alphabet in combination used to represent certain sounds; Words are vocal sounds used to represent ideas; Words are representatives, written or spoken, of ideas, which, taken in combination, constitute Language.

How many readers ever stop to think that there was a time when there were no words, or how certain words came to be used to represent certain thoughts or ideas; how language has grown, and is still growing, or how new words are constantly being introduced from foreign languages, or constructed entire? To those who have not seen the book above named, it will open a fountain of instruction and entertainment. Dr. TRENCH, in speaking on this point, quotes the words of a writer who says:—"In a language like ours there are few modes of instruction more useful or amusing than that of accustoming young people to seek for the etymology or primary meaning of the words they use. There are cases in which knowledge of more value may be conveyed by the history of a word than by the history of a campaign."

Take as an example (condensed from the "Study of Words,") the derivation of our word frank—meaning free, open and honest. A German tribe, proud of their liberty, gave themselves the name of "Franks," or free men. They conquered Gaul and gave it their name—now France. They were superior to the Gauls and Romans in Gaul, in their love of freedom and of truth, in their uprightness and true manliness,—and thus it came that the name of the tribe or of its members—Frank—became the synonym of high moral qualities. So of the word *slave*. The conquering Teutonic races, in the olden time, were enabled to keep their markets for servants supplied from the Sclavonic tribes, and the name Sclav became sig-

nificant of servitude—a slight change in the spelling made our word slave.

We could fill an entire number of the RURAL with extracts from this book, but our space will not permit. We hope, however, to be able to awaken the attention of our readers to its merits.

Most words have a derivation. There are few used exactly as at first spoken. All names were originally given to the things named for a reason, although that reason may, in many cases, be now hidden from us. Names, as now applied to towns, post-offices and counties in this country, are, in many instances, far from original—having been most foolishly conferred to gratify the pride of a politician or the vanity of some purse-proud ignoramus, while others are duplicates of those used in older countries, where they were conferred in the first instance with a meaning. We will notice Cambridge, situated in England, on the River Cam, at a point where a bridge is built over the river. [We never found why the short a in Cam was changed to long a in Cambridge.] All places with names ending in bridge will be found to have been similarly located. So will names ending in mouth—as Dartmouth, Weymouth, &c.—be found to have been first applied to towns situated at the mouths of rivers. The termination ham, or hame, is a corruption of home—as Nottingham, the home of the Nottings. Such corruptions sometimes make strange names. A party of French Protestants—objects of religious persecution—came from the vicinity of the river Waal, in the Netherlands, and settled on Long Island, opposite New York. They were called Waaloons or Walloons, and the water adjacent to their settlement Walloons Boght or Bay, now known as Wallabout. [We once heard it stated this name came from the fact that the Navy Yard, that occupies land bordering on the Bay, is surrounded by a high wall!] Brooklyn is from Breuck landt, signifying Broken land.

Most of the imported names applied to American towns are used not only without the slightest show of reason, but with great impropriety. New York has its Rome, Athens and Corinth, eighteen States have a Paris and eight a London, while Toledo (from Toletum), meaning the Mother of the People, is adopted both by Ohio and Iowa.

As to the origin of language, our author accepts the ideas more prevalent at the time he wrote than now. His theological teachings and surroundings doubtless had influence to bias his judgment. While he has general ideas of the evolution of words, he holds man was created with reason full and complete, and with power to use words, as is shown from the fact that ADAM named all creatures at sight. "God did not teach him words as one of us teaches a parrot, from without, but gave him a capacity, and then evoked that capacity."

He was not alone in his opinion, and was probably in advance of many able writers, who held that language was originally revealed from heaven, and that as the first man was created full and complete, physically, so he was mentally, and endowed with the power of language, which employs both the physical and mental in its production. To explain how there are now so many languages instead of the one given by Divine inspiration, the supporters of this view point us to the confusion of tongues at the Tower of Babel. Others, and we think more correctly, hold that language is of slow growth. That in the beginning ideas were few and crude, and were conveyed by a single sound, and that as man has, in successive ages, passed from one degree of intelligence to another, so has his power of conceiving and expressing ideas increased. This, the evolution theory, has made rapid progress in the past few years, and had the "Study of Words" now to be re-written, we presume its teachings relative to the origin of language would be much modified.

This book should not be confounded with another entitled "Words and their Uses," by another author, which, commendable as it is for its general purpose, originality and terseness of expression, occupies a different field. The work under notice aims to incite a desire, in the mind of the reader, to get an understanding of the word, by finding how and why it or its derivation was first used.

The present edition excels the former ones, inasmuch as Prof. SUPLEE has added a complete and exhaustive analysis of the revised text—prepared a set of questions which enable the general reader to fix more readily and firmly in his memory the principal topics, and added many words intended to encourage original research on the part of the student,—thus rendering it better adapted for classes in schools and seminaries.

MAGAZINES.

DEMORESTS' Magazine for April is an unusuaally fine number. It is without exception, the best journal of its class published in this country and the high encomiums lavished on it abroad, lead us to the conclusion that it stands without a peer "across the pond." Usually, periodicals designed for women are vapid to the last degree, but this journal is an honorable exception. Besides the fashion intelligence (amply illustrated) there are stories, sketches, travels and general miscellany, hints on etiquette, and a correspondence department. It would take a column to merely enumerate the good things it contains. So we'll content ourselves with merely stating there is this addition to the Magazine's usuals attractiveness—the April number contains a little gem of art entitled "Easter Morning."

DU CHAILLU is full of comforting assurances for the fair sex. He says that cannibals take women 16 to 24 years old in a roasted shape. When they are 55 they boil them. After all we like the American style. We toast them.

For Women.

CONDUCTED BY MISS FAITH RIPLEY.

AN APOLOGY FOR FLIRTATION.

"AH! women are fickle! you tell me,
"Well—yes—if by fickle you mean
A trifle less false than you men are;
And greatly more true than they seem,"

"But women are cruel—so cruel!
They flatter and coax for awhile,
Then tread on the hearts that we give them,
And deal us a blow with a smile!"

"We are cruel—it may be; but cruel
In a million of charming ways:
So sorry at times to have hurt you,
So kind on the gloomiest days.

"But you men!—you calculate nicely
How near you may go, or how far,
Nor never one moment you soften,
Nor pity the hopes you mar.

"And when you at last are successful,
And the flower floats down to your feet,
Its colors are no more so perfect,
Its perfume is no more so sweet.
